P. V.	Pasquale Villari. See the biographical article: Villari, Pasquale.	**Pisa.**
R. C. J.	Sir Richard Claverhouse Jebb, LL.D., D.C.L. See the biographical article: Jebb, Sir Richard Claverhouse.	**Pindar** (*in part*).
R. G.	Richard Garnett, LL.D. See the biographical article: Garnett, Richard.	**Peacock, Thomas Love.**
R. I. P.	Reginald Innes Pocock, F.Z.S. Superintendent of the Zoological Gardens, London.	**Pedipalpi; Pentastomida.**
R. K. D.	Sir Robert Kennaway Douglas. Formerly Professor of Chinese, King's College, London. Keeper of Oriental Printed Books and MSS. at British Museum, 1892–1907. Member of the Chinese Consular Service, 1858–1865. Author of *The Language and Literature of China*; *China*; *Europe and the Far East*; &c.	**Peking.**
R. L.*	Richard Lydekker, F.R.S., F.Z.S., F.G.S. Member of the Staff of the Geological Survey of India, 1874–1882. Author of *Catalogues of Fossil Mammals, Reptiles and Birds in the British Museum*; *The Deer of all Lands*; &c.	**Peccary; Pecora; Père David's Deer; Perissodactyla; Phalanger; Phenacodus; Pica; Polecat.**
R. N. B.	Robert Nisbet Bain (d. 1909). Assistant Librarian, British Museum, 1883–1909. Author of *Scandinavia: the Political History of Denmark, Norway and Sweden, 1513–1900*; *The First Romanovs, 1613–1725*; *Slavonic Europe: The Political History of Poland and Russia from 1469 to 1796*; &c.	**Pazmány; Pechlin; Peter I. and III. of Russia; Petöfi, Alexander Philaret; Piper, Carl; Poland**: *History* (*in part*).
R. Po.	René Poupardin, D. ès L. Secretary of the École des Chartes. Honorary Librarian at the Bibliothèque Nationale, Paris. Author of *Le Royaume de Provence sous les Carolingiens*; *Recueil des chartes de Saint-Germain*; &c.	**Philip the Bold; Philip the Good.**
R. P. S.	R. Phené Spiers, F.S.A., F.R.I.B.A. Formerly Master of the Architectural School, Royal Academy, London. Past President of Architectural Association. Associate and Fellow of King's College, London. Corresponding Member of the Institute of France. Editor of Fergusson's *History of Architecture*. Author of *Architecture: East and West*; &c.	**Pier** (*in architecture*).
R. S.*	Ralph Stockman, M.D., F.R.S.(Edin.), F.R.C.P.(Edin.). Professor of Materia Medica and Therapeutics in the University of Glasgow.	**Pharmacology.**
R. S. C.	Robert Seymour Conway, M.A., D.Litt. Professor of Latin and Indo-European Philology in the University of Manchester. Formerly Professor of Latin in University College, Cardiff, and Fellow of Gonville and Caius College, Cambridge. Author of *The Italic Dialects*.	**Picenum** (*in part*).
R. W.	Robert Wallace, F.R.S.(Edin.), F.L.S. Professor of Agriculture and Rural Economy at Edinburgh University, and Garton Lecturer on Colonial and Indian Agriculture. Professor of Agriculture, R.A.C., Cirencester, 1882–1885. Author of *Farm Live Stock of Great Britain*; *The Agriculture and Rural Economy of Australia and New Zealand*; *Farming Industries of Cape Colony*; &c.	**Pig** (*in part*).
S. A. C.	Stanley Arthur Cook, M.A. Lecturer in Hebrew and Syriac, and formerly Fellow, Gonville and Caius College, Cambridge. Editor for the Palestine Exploration Fund. Examiner in Hebrew and Aramaic, London University, 1904–1908. Author of *Glossary of Aramaic Inscriptions*; *The Law of Moses and the Code of Hammurabi*; *Critical Notes on Old Testament History*; *Religion of Ancient Palestine*; &c	**Philistines.**
S. F. H.	Sidney Frederic Harmer, M.A., D.Sc., F.R.S., F.Z.S. Keeper of Zoology, Natural History Department, British Museum. Fellow, formerly Tutor and Lecturer, King's College, Cambridge. Joint-editor of *The Cambridge Natural History*.	**Phoronidea.**

S. H. V.*	SYDNEY HOWARD VINES, M.A., D.Sc., F.R.S. Sherardian Professor of Botany, University of Oxford and Fellow of Magdalen College. Fellow of the University of London. President of the Linnean Society, 1900–1904. Formerly Reader in Botany in the University of Cambridge and Fellow and Lecturer of Christ's College. Author of *A Student's Textbook of Botany*; &c.	**Plants:** *Morphology.*
S. N.	SIMON NEWCOMB, D.Sc., LL.D. See the biographical article: NEWCOMB, SIMON.	**Planet; Planets, Minor.**
T. As.	THOMAS ASHBY, M.A., D.LITT. Director of British School of Archaeology at Rome. Formerly Scholar of Christ Church, Oxford. Craven Fellow, 1897. Conington Prizeman, 1906. Member of the Imperial German Archaeological Institute. Author of *The Classical Topography of the Roman Campagna.*	**Perugia; Picenum** (*in part*); **Piperno.**
T. Ba.	SIR THOMAS BARCLAY. Member of the Institute of International Law. Officer of the Legion of Honour. Author of *Problems of International Practice and Diplomacy*; &c. M.P. for Blackburn, 1910.	**Peace; Peace Conferences; Pirate and Piracy:** *Law.*
T. F. C.	THEODORE FREYLINGHUYSEN COLLIER, PH.D. Assistant Professor of History, Williams College, Williamstown, Mass., U.S.A.	**Pius III., IV. and V.**
T. G. Br.	THOMAS GREGOR BRODIE, M.D., F.R.S. Professor Superintendent, Brown Animal Sanatory Institution, University of London. Professor of Physiology, Royal Veterinary College, London. Lecturer on Physiology, London School of Medicine for Women. Fellow of King's College, London. Author of *Essentials of Experimental Physiology.*	**Phagocytosis.**
T. M. L.	REV. THOMAS MARTIN LINDSAY, LL.D., D.D. Principal of the United Free Church College, Glasgow. Formerly Assistant to the Professor of Logic and Metaphysics in the University of Edinburgh. Author of *History of the Reformation*; *Life of Luther*; &c.	**Plymouth Brethren** (*in part*).
Th. N.	THEODOR NÖLDEKE, PH.D. See the biographical article: NÖLDEKE, THEODOR.	**Persepolis** (*in part*).
T. S.*	SIR THOMAS STEVENSON, M.D., F.R.C.P. (1838–1908). Formerly Senior Scientific Analyst to the Home Office. Lecturer on Chemistry and Forensic Medicine at Guy's Hospital, London.	**Poison.**
T. W.-D.	WALTER THEODORE WATTS-DUNTON. See the biographical article: WATTS-DUNTON, WALTER THEODORE.	**Poetry.**
T. W. H.	THOMAS WENTWORTH HIGGINSON, A.M., LL.D. Author of *Atlantic Essays*; *Cheerful Yesterdays*; *History of the United States*; &c.	**Phillips, Wendell.**
T. W. R. D.	THOMAS WILLIAM RHYS DAVIDS, LL.D., PH.D. Professor of Comparative Religion, Manchester University. President of the Pali Text Society. Fellow of the British Academy. Secretary and Librarian of Royal Asiatic Society, 1885–1902. Author of *Buddhism*; *Sacred Books of the Buddhists*; *Early Buddhism*; *Buddhist India*; *Dialogues of the Buddha*; &c.	**Piprāwa.**
W. C. Su.	WALTER COVENTRY SUMMERS, M.A. Professor of Latin in the University of Sheffield. Formerly Fellow of St John's College, Cambridge. Craven Scholar, 1890. Chancellor's Medallist, 1892. Author of *A Study of Valerius Flaccus*; &c.	**Persius; Petronius** (*in part*).
W. D. C.	WILLIAM DOUGLAS CARÖE, M.A., F.S.A., F.R.I.B.A. Trinity College, Cambridge. Architect to the Ecclesiastical Commission and the Charity Commission, London.	**Pearson, John Loughborough.**
W. D. W.	WILLIAM DWIGHT WHITNEY. See the biographical article: WHITNEY, WILLIAM DWIGHT.	**Philology** (*in part*).
W. de W. A.	SIR WILLIAM DE WIVELESLIE ABNEY, K.C.B., D.C.L., D.Sc., F.R.S. Advisor in Science to the Board of Education for England. Member of the Advisory Council for Education to the War Office. Formerly President of Royal Astronomical Society, Physical Society and Royal Photographic Society. Author of *Instruction in Photography*; *Colour Vision*; &c.	**Photography.**
W. E. G. F.	WILLIAM EDWARD GARRETT FISHER, M.A. Author of *The Transvaal and the Boers.*	**Phylloxera.**
W. Fr.	WILLIAM FREAM, LL.D. (d. 1906). Formerly Lecturer on Agricultural Entomology, University of Edinburgh, and Agricultural Correspondent of *The Times.*	**Pig** (*in part*).
W. F. C.	WILLIAM FEILDEN CRAIES, M.A. Barrister-at-Law, Inner Temple and Lecturer on Criminal Law, King's College, London. Editor of Archbold's *Criminal Pleading* (23rd edition).	**Pleading.**
W. Ga.	WALTER GARSTANG, M.A., D.Sc. Professor of Zoology in the University of Leeds. Formerly Fellow of Lincoln College, Oxford. Scientific Adviser to H.M. Delegates on the International Council for the Exploration of the Sea, 1901–1907. Author of *The Impoverishment of the Sea*; &c.	**Pisciculture.**
W. Hi.	WHEELTON HIND, M.D., F.R.C.S., F.G.S. Surgeon, North Staffs Infirmary. Lyell Medallist, Geological Society, 1902. Author of *British Carboniferous Lamellibranchiata*; &c.	**Pendleside Series.**
W. H. F.	SIR WILLIAM HENRY FLOWER, F.R.S. See the biographical article: FLOWER, SIR W. H.	**Platypus** (*in part*).

W. M. R.	WILLIAM MICHAEL ROSSETTI. See the biographical article: ROSSETTI, DANTE G.	Perino del Vaga; Perugino, Pietro.
W. M. Ra.	SIR WILLIAM MITCHELL RAMSAY, LL.D., D.C.L., D.LITT. See the biographical article: RAMSAY, SIR W. M.	Phrygia; Pisidia.
W. P. C.	WILLIAM PRIDEAUX COURTNEY. See the article: COURTNEY, BARON.	Peterborough and Monmouth, Earl of.
W. R. M.	WILLIAM RICHARD MORFILL, M.A. (d. 1910). Formerly Professor of Russian and the other Slavonic Languages in the University of Oxford. Curator of the Taylorian Institution, Oxford. Author of *Russia*; *Slavonic Literature*; &c.	Poland: *Literature*.
W. R. S.	WILLIAM ROBERTSON SMITH, LL.D. See the biographical article: SMITH, WILLIAM ROBERTSON.	Phylactery (*in part*).
W. R. S.*	WILLIAM ROY SMITH, M.A., PH.D. Associate Professor of History, Bryn Mawr College, Pennsylvania. Author of *Sectionalism in Pennsylvania during the Revolution*; &c.	Polk, James Knox.

ENCYCLOPÆDIA BRITANNICA

ELEVENTH EDITION

VOLUME XXI

PAYN, JAMES (1830–1898), English novelist, was born at Cheltenham, on the 28th of February 1830, his father being clerk to the Thames Commissioners and treasurer to the county of Berkshire. He was educated at Eton, and afterwards entered the Military Academy at Woolwich; but his health was not equal to the demands of a military career, and he proceeded in 1847 to Trinity College, Cambridge. He was among the most popular men of his time, and served as president of the Union. Before going to Cambridge he had published some verses in Leigh Hunt's *Journal*, and while still an undergraduate put forth a volume of *Stories from Boccaccio* in 1852, and in 1853 a volume of *Poems*. In the same year he left Cambridge, and shortly afterwards married Miss Louisa Adelaide Edlin, sister of Sir Peter Edlin. He then settled down in the Lake district to a literary career and contributed regularly to *Household Words* and *Chambers's Journal*. In 1858 he removed to Edinburgh to act as joint-editor of the latter periodical. He became sole editor in 1859, and conducted the magazine with much success for fifteen years. He removed to London in 1861. In the pages of the *Journal* he published in 1864 his most popular story, *Lost Sir Massingberd*. From this time he was always engaged in novel-writing, among the most popular of his productions being *Married Beneath Him* (1865), *Carlyon's Year* (1868), *By Proxy* (1878), and *The Talk of the Town* (1885). In 1883 he succeeded Leslie Stephen as editor of the *Cornhill Magazine* and continued in the post until the breakdown of his health in 1896. He was also literary adviser to Messrs Smith, Elder & Company. His publications included a *Handbook to the English Lakes* (1859), and various volumes of occasional essays, *Maxims by a Man of the World* (1869), *Some Private Views* (1881), *Some Literary Recollections* (1884). A posthumous work, *The Backwater of Life* (1899), revealed much of his own personality in a mood of kindly, sensible reflection upon familiar topics. He died in London on the 25th of March 1898.

A biographical introduction to *The Backwater of Life* was furnished by Sir Leslie Stephen.

PAYNE, PETER (*c.* 1380–1455), English Lollard and Taborite, the son of a Frenchman by an English wife, was born at Hough-on-the-Hill near Grantham, about 1380. He was educated at Oxford, where he adopted Lollard opinions, and had graduated as a master of arts before the 6th of October 1406, when he was concerned in the irregular proceedings through which a letter declaring the sympathy of the university was addressed to the Bohemian reformers. From 1410 to 1414 Payne was principal of St Edmund Hall, and during these years was engaged in controversy with Thomas Netter of Walden, the Carmelite defender of Catholic doctrine. In 1414 he was compelled to leave Oxford and taught for a time in London. Ultimately he had to flee from England, and took refuge in Bohemia, where he was received by the university of Prague on the 13th of February 1417, and soon became a leader of the reformers. He joined the sect of the "Orphans," and had a prominent part in the discussions and conferences of the ten years from 1420 to 1430. When the Bohemians agreed to send representatives to the Council of Basel, Payne was naturally chosen to be one of their delegates. He arrived at Basel on the 4th of January 1433, and his unyielding temper and bitter words probably did much to prevent a settlement. The Bohemians left Basel in April. The party of the nobles, who had been ready to make terms, were attacked in the Diet at Prague by the Orphans and Taborites. Next year the dispute led to open war. The nobles were victorious at Lipau on the 29th of May 1434, and it was reported in England that Payne was killed. When soon afterwards the majority of the Orphans joined the moderate party, Payne allied himself with the more extreme Taborites. Nevertheless his reputation was so great that he was accepted as an arbitrator in doctrinal disputes amongst the reformers. In February 1437 the pope desired the emperor Sigismund to send Payne to be tried for heresy at Basel. Payne had to leave his pastorate at Saas, and took refuge with Peter Chelcicky, the Bohemian author. Two years later he was captured and imprisoned at Gutenstein, but was ransomed by his Taborite friends. Payne took part in the conferences of the Bohemian parties in 1443–1444, and again in 1452. He died at Prague in 1455. He was a learned and eloquent controversialist, and a faithful adherent to Wycliffe's doctrine. Payne was also known as Clerk at Oxford, as Peter English in Bohemia, and as Freyng, after his French father, and Hough from his birthplace.

Bibliography.—The chief facts of Payne's English career are given in the *Loci e libro veritatum* of T. Gascoigne (ed. Thorold Rogers, Oxford, 1881). For his later life the principal sources are contained in the *Monumenta conciliorum generalium saeculi v., Saeculi xv.*, or *saeculi quintodecimi*, vols. i.–iii. (Vienna, 1857–1894). For modern authorities consult Palacky, *Geschichte von Böhmen*, vii.–ix., and Creighton's *History of the Papacy*. The biography by James Baker, *A Forgotten Great Englishman* (London, 1894), is too partial. (C. L. K.)

PAYNTER (or Painter), **WILLIAM** (*c.* 1540–1594), English author, was a native of Kent. He matriculated at St John's College, Cambridge, in 1554. In 1561 he became clerk of the ordnance in the Tower of London, a position in which he appears to have amassed a fortune out of the public funds. In 1586 he confessed that he owed the government a thousand pounds, and in the next year further charges of peculation were brought against him. In 1591 his son Anthony owned that he and his father had abused their trust, but Paynter retained his office until his death. This event probably followed

immediately upon his will, which was nuncupative and was dated the 14th of February 1594. The first volume of his *Palace of Pleasure* appeared in 1566, and was dedicated to the earl of Warwick. It included sixty tales, and was followed in the next year by a second volume containing thirty-four new ones. A second improved edition in 1575 contained seven new stories. Paynter borrows from Herodotus, Plutarch, Aulus Gellius, Aelian, Livy, Tacitus, Quintus Curtius; from Giraldi Cinthio, Matteo Bandello, Ser Giovanni Fiorentino, Straparola, Queen Margaret of Navarre and others. To the vogue of this and similar collections we owe the Italian setting of so large a proportion of the Elizabethan drama. The early tragedies of *Appius and Virginia* and *Tancred and Gismund* were taken from *The Palace of Pleasure*; and among better-known plays derived from the book are the Shakespearian *Timon of Athens*, *All's Well that Ends Well* (from Giletta of Narbonne), Beaumont and Fletcher's *Triumph of Death*, and Shirley's *Love's Cruelty*.

The Palace of Pleasure was edited by Joseph Haslewood in 1813. This edition was collated (1890) with the British Museum copy of 1575 by Mr Joseph Jacobs, who added further prefatory matter, including an introduction dealing with the importance of Italian *novelle* in Elizabethan drama.

PAYSANDÚ, or PAISANDÚ, a town and river port of Uruguay and capital of a department of the same name, on the left bank of the Uruguay River about 214 m. N.W. of Montevideo, with which it is connected by rail. Pop. (1908 estimate), 15,000. It has railway connexion with Rio Negro and Montevideo to the south-east, and with Salto and Santa Rosa, on the Brazilian frontier, on the north; it is at the head of low water navigation on the Uruguay River, and is in regular steamer communication with Montevideo and Buenos Aires.

There are some good public buildings, including two churches, a hospital, a theatre and the government offices. Paysandú exports cattle and sheep and salted meats, hides, ox tongues, wool and other animal products. There is a meat-curing establishment (*saladero*) at Guaviyú, in the vicinity. The town was named in honour of Pay, or Pai (Father) Sandú, a priest who settled there in 1772. It has suffered severely from revolutionary outbreaks, was bombarded by Rivera in 1846, and was partly destroyed in 1865 by a Brazilian bombardment, after which its gallant defenders, Leandro Gomez and his companions, were butchered in cold blood.

The department of Paysandú—area, 5117 sq. m.; pop. (1907 estimate), 54,097—is one of the richest stock-raising regions of the republic.

PAYSON, EDWARD (1783–1827), American Congregational preacher, was born on the 25th of July 1783 at Rindge, New Hampshire, where his father, Seth Payson (1758–1820), was pastor of the Congregational Church. His uncle, Phillips Payson (1736–1801), pastor of a church in Chelsea, Massachusetts, was a physicist and astronomer. Edward Payson graduated at Harvard in 1803, was then principal of a school at Portland, Maine, and in 1807 became junior pastor of the Congregational Church at Portland, where he remained, after 1811, as senior pastor, until his death on the 22nd of October 1827.

The most complete collection of his sermons, with a memoir by Asa Cummings originally published in 1828, is the *Memoir, Select Thoughts and Sermons of the late Rev. Edward Payson* (3 vols. Portland, 1846; Philadelphia, 1859). Based on this is the volume, *Mementos of Edward Payson* (New York, 1873), by the Rev. E. L. Janes of the Methodist Episcopal Church.

PÁZMÁNY, PÉTER (1570–1637), Hungarian cardinal and statesman, was born at Nagyvárad on the 4th of October 1570, and educated at Nagyvárad and Kolozsvár, at which latter place he quitted the Calvinist confession for the Roman communion (1583). In 1587 he entered the Jesuit order. Pázmány went through his probation at Cracow, took his degree at Vienna, and studied theology at Rome, and finally completed his academic course at the Jesuit college at Graz. In 1601 he was sent to the order's establishment at Sellye, where his eloquence and dialectic won back hundreds to Rome, including many of the noblest families. Prince Nicholas Esterházy and Paul Rákóczy were among his converts. In 1607 he was attached to the archbishop of Esztergom, and in the following year attracted attention by his denunciation, in the Diet, of the 8th point of the peace of Vienna, which prohibited the Jesuits from acquiring landed property in Hungary. At about the same time the pope, on the petition of the emperor Matthias II., released Pázmány from his monkish vows. On the 25th of April 1616 he was made dean of Turócz, and on the 28th of September became primate of Hungary. He received the red hat from Urban VIII. in 1629. Pázmány was the soul of the Roman Catholic reaction in Hungary. Particularly remarkable is his *Igazsága vezetö Kalauz* (*Guide to Truth*), which appeared in 1613. This manual united all the advantages of scientific depth, methodical arrangement and popular style. As the chief pastor of the Hungarian church Pázmány used every means in his power, short of absolute contravention of the laws, to obstruct and weaken Protestantism, which had risen during the 16th century. In 1619 he founded a seminary for theological candidates at Nagyszombat, and in 1623 laid the foundations of a similar institution at Vienna, the still famous Pazmanaeum, at a cost of 200,000 florins. In 1635 he contributed 100,000 florins towards the foundation of a Hungarian university. He also built Jesuit colleges and schools at Pressburg, and Franciscan monasteries at Érsékújvár and Körmöczbánya. In politics he played a considerable part. It was chiefly due to him that the diet of 1618 elected the archduke Ferdinand to succeed the childless Matthias II. He also repeatedly thwarted the martial ambitions of Gabriel Bethlen, and prevented George Rákóczy I., over whom he had a great influence, from combining with the Turks and the Protestants. But Pázmány's most unforgettable service to his country was his creation of the Hungarian literary language. As an orator he well deserved the epithet of " the Hungarian purple Cicero." Of his numerous works the chief are: *The Four Books of Thomas à Kempis on the Imitation of Christ* (Hung., 1603), of which there are many editions; *Diatribe theologica de visibili Christi in terris ecclesia* (Graz, 1615); *Vindiciae ecclesiasticae* (Vienna, 1620); *Sermons for every Sunday in the Year* (Hung., Pressburg, 1636); *The Triumph of Truth* (Hung., Pressburg, 1614).

See Vilmós Fraknói, *Peter Pázmány and his Times* (Hung., Pest, 1868–1872); *Correspondence of Pázmány* (Hung. and Latin), published by the Hungarian Academy (Pest, 1873). (R. N. B.)

PAZ SOLDAN, MARIANO FELIPE (1821–1886), Peruvian historian and geographer, was born at Arequipa, on the 22nd of August 1821. He studied law, and after holding some minor judicial offices, was minister to Colombia in 1853. After his return he occupied himself with plans for the establishment of a model penitentiary at Lima, which he was enabled to accomplish through the support of General Castilla. In 1860 Castilla made him director of public works, in which capacity he superintended the erection of the Lima statue of Bolivar. He was also concerned in the reform of the currency by the withdrawal of the debased Bolivian coins. In 1861 he published his great atlas of the republic of Peru, and in 1868 the first volume of his history of Peru after the acquisition of her independence. A second volume followed, and a third, bringing the history down to 1839, was published after his death by his son. In 1870 he was minister of justice and worship under President Balta, but shortly afterwards retired from public life to devote himself to his great geographical dictionary of Peru, which was published in 1877. During the disastrous war with Chile he sought refuge at Buenos Aires, where he was made professor in the National College, and where he wrote and published a history of the war (1884). He died on the 31st of December 1886.

PEA (*Pisum*), a genus of the order Leguminosae, consisting of herbs with compound pinnate leaves ending in tendrils, by means of which the weak stems are enabled to support themselves, and with large leafy stipules at the base. The flowers (fig. 1) are typically " papilionaceous," with a " standard " or large petal above, two side petals or wings, and two front petals below forming the keel. The stamens are ten—nine united, the tenth usually free or only slightly joined to the others.

This separation allows approach to the honey which is secreted at the base of the staminal tube. The ovary is prolonged into a long, thick, bent style, compressed from side to side at the tip and fringed with hairs. The fruit is a characteristic "legume" or pod (fig. 2), bursting when ripe into halves, which bear the large globular seeds (peas) on their edges. These seeds are on short stalks, the upper extremity of which is dilated into a shallow cup (*aril*); the two seed-leaves (*cotyledons*) are thick and fleshy, with a radicle bent along their edges on one side. The genus is exceedingly close to *Lathyrus*, being only distinguished technically by the style, which in the latter genus is compressed from above downwards and not thick.

car, Carina, or Keel.

It is not surprising, therefore, that under the general name "pea" species both of *Pisum* and of *Lathyrus* are included. The common field pea with tan-coloured or compressed mottled seeds and two to four leaflets is *Pisum arvense*, which is cultivated in all temperate parts of the globe, but which, according to the Italian botanists, is truly a native of central and southern Italy: it has purple flowers. The garden pea, *P. sativum*, which has white flowers, is more tender than the preceding, and its origin is not known. It has not been found in a wild state anywhere, and it is considered that it may be a form of *P. arvense*, having, however, from four to six leaflets to each leaf and globular seeds of uniform colour.

P. sativum was known to Theophrastus; and De Candolle (*Origin of Cultivated Plants*, p. 329) points out that the word "pison" or its equivalent occurs in the Albanian tongue as well as in Latin, whence he concludes that the pea was known to the Aryans, and was perhaps brought by them into Greece and Italy. Peas have been found in the Swiss lake-dwellings of the bronze period. The garden peas differ considerably in size, shape of pod, degree of productiveness, form and colour of seed, &c. The sugar peas are those in which the inner lining of the pod is very thin instead of being somewhat horny, so that the whole pod can be eaten. Unlike most papilionaceous plants, peaflowers are perfectly fertile without the aid of insects, and thus do not intercross so freely as most similar plants do. On the other hand, a case is known wherein the pollen from a purple-podded pea applied to the stigma of one of the green-podded sugar peas produced a purple pod, showing that not only the ovule but even the ovary was affected by the cross. The numerous varieties of peas in cultivation have been obtained by cross-fertilization, but chiefly by selection. Peas constitute a highly nutritious article of diet from the large quantity of nitrogenous materials they contain in addition to starchy and saccharine matters.

The sweet pea, cultivated for the beauty and fragrance of its flowers, is a species of the allied genus *Lathyrus* (*L. odoratus*), a native of southern Europe. The chick pea (*q.v.*) (*Cicer arietinum*), not cultivated in England, is still farther removed from the true peas. The everlasting pea of gardens is a species of *Lathyrus* (*L. latifolius*) with very deep fleshy roots, bold foliage, and beautiful but scentless flowers; the field pea (*Pisum arvense*) is better adapted than the bean to light soils, and is best cultivated in rows of such a width as to admit of horse-hoeing. The early stage at which the plants fall over, and forbid further culture, renders it even more needful than in the case of beans to sow them only on land already clean. If annual weeds can be kept in check until the peas once get a close cover, they then occupy the ground so completely that nothing else can live under them; and the ground, after their removal, is found in the choicest condition. A thin crop of peas should never be allowed to stand, as the land is sure to get perfectly wild. The difficulty of getting this crop well harvested renders it peculiarly advisable to sow only the early varieties.

The pea prefers a friable calcareous loam, deeply worked, and well enriched with good hotbed or farm-yard manure. The early crops require a warm sheltered situation, but the later are better grown 6 or 8 ft. apart, or more, in the open quarters, dwarf crops being introduced between the rows. The dwarf or early sorts may be sown 3 or 4 ft. apart. The deep working of the soil is of importance, lest the plants should suffer in hot dry weather from mildew or arrest of growth. The first sowing may be made about the beginning or middle of November, in front of a south wall, the plants being defended by spruce fir branches or other spray throughout the winter. In February sowings are sometimes made in private gardens, in flower-pots or boxes, and the young plants afterwards planted out. The main crop should be sown towards the end of February, and moderate sowings should be made twice a month afterwards, up to the beginning of July for the north, and about the third week in July for warmer districts. During dry hot weather late peas derive great benefit from mulching and watering. The latest sowings, at the middle or end of August, should consist of the best early sorts, as they are not so long in producing pods as the larger and finer sorts, and by this means the supply may be prolonged till October or November. As they grow the earth is drawn up to the stems, which are also supported by stakes, a practice which in a well-kept garden is always advisable, although it is said that the early varieties arrive sooner at maturity when recumbent.

Peas grown late in autumn are subject to mildew, to obviate which it has been proposed to dig over the ground in the usual way, and to soak the spaces to be occupied by the rows of peas thoroughly with water—the earth on each side to be then collected so as to form ridges 7 or 8 in. high, these ridges being well watered, and the seed sown on them in single rows. If dry weather at any time set in, water should be supplied profusely once a week.

To produce very early crops the French market-gardeners used to sow early in November, in frames, on a border having a good aspect, the seeds being covered very slightly. The young plants are transplanted into other frames in December, the ground inside being dug out so as to be 18 or 20 in. below the sashes, and the earth thus removed placed against the outside of the frames. The young plants, when 3 or 4 in. high, are planted in patches of three or four, 8 in. asunder, in four longitudinal rows. The sashes are covered at night with straw mats, and opened whenever the weather is sufficiently mild. When 8 or 10 in. high the stems are inclined towards the back of the frame, a little earth being drawn to their base, and when the plants come into blossom the tops are pinched out above the third or fourth flower to force them into bearing. As soon as they begin to pod, the soil may have a gentle watering, whenever sufficiently warmed by the sun, but a too vigorous growth at an earlier period would be detrimental. Thus treated the plants bear pods fit for gathering in the first fortnight in April.

A very convenient means of obtaining an early crop is to sow in 5-in. pots, a few seeds in each, the plants to be ultimately planted out on a warm border. Peas may also be obtained early if gently forced in frames, in the same way as kidney beans, the dwarfest varieties being preferable.

For the very early peas the rows should range east and west, but for the main crops north and south. The average depth of the drills should be about 2 in. for small sorts, and a trifle more for the larger kinds. The drills should be made wide and flat at bottom so that the seeds may be better separated in sowing. The large sorts are the better for being sown 3 in. apart. Chopped furze may be advantageously scattered in the drill before covering in, to check the depredations of mice, and before levelling the surface the soil should be gently trodden down over the seeds.

A good selection of sorts may be made from the following:—

Early.—William Hurst; Chelsea Gem; Sutton's Bountiful and Excelsior; Gradus.

Second Early.—Stratagem; Telephone; Telegraph; Carter's Daisy; Duke of York; Veitch's Autocrat.

Late.—Veitch's Perfection; Ne Plus Ultra, the finest of all late peas, but a little delicate in cold wet soils and seasons; British Queen; Champion of England; Duke of Albany.

PEABODY, ANDREW PRESTON (1811–1893), American clergyman and author, was born in Beverly, Massachusetts, on the 19th of March 1811, and was descended from Lieut. Francis Peabody of St Albans, who emigrated to Massachusetts in 1635. He learned to read before he was three years old, entered Harvard College at the age of twelve, and graduated in 1826, with the single exception of Paul Dudley (class of 1690) the youngest graduate of Harvard. In 1833 he became assistant pastor of the South Parish (Unitarian) of Portsmouth, New Hampshire; the senior pastor died before Peabody had been preaching a month, and he succeeded to the charge of the church, which he held until 1860. In 1852–1860 he was proprietor and editor of the *North American Review*. He was preacher to

Harvard University and Plummer professor of Christian morals from 1860 to 1881, and was professor emeritus from 1881 until his death in Boston, Massachusetts, on the 10th of March 1893. On the walls of Appleton Chapel, Cambridge, U.S.A., is a bronze tablet to his memory.

Besides many brief memoirs and articles, he wrote: *Christianity the Religion of Nature* (2nd ed., 1864), Lowell Institute Lectures; *Reminiscences of European Travel* (1868); *A Manual of Moral Philosophy* (1873); *Christian Belief and Life* (1875), and *Harvard Reminiscences* (1888). See the *Memoir* (Cambridge, 1890) by Edward J. Young.

PEABODY, ELIZABETH PALMER (1804–1894), American educationist, was born at Billerica, Massachusetts, on the 16th of May 1804. Early in life she was assistant in A. Bronson Alcott's school in Boston, Mass., the best account of which is probably her *Record of Mr Alcott's School* (1835). She had been instructed in Greek by Emerson at Concord when she was eighteen years old. She became interested in the educational methods of Froebel, and in 1860 opened in Boston a small school resembling a kindergarten. In 1867 she visited Germany for the purpose of studying Froebel's methods. It was largely through her efforts that the first public kindergarten in the United States was established in Boston in 1870. She died at Jamaica Plain, Boston, on the 3rd of January 1894. She was the sister-in-law of Nathaniel Hawthorne and of Horace Mann.

Among her publications are: *Kindergarten in Italy* (1872); *Reminiscences of William Ellery Channing* (1880); *Lectures in the Training Schools for Kindergartners* (1888); and *Last Evening with Allston, and other Papers* (1886).

PEABODY, GEORGE (1795–1869), American philanthropist, was descended from an old yeoman family of Hertfordshire, England, named Pabody or Pebody. He was born in the part of Danvers which is now Peabody, Mass., on the 18th of February 1795. When eleven years old he became apprentice at a grocery store. At the end of four years he became assistant to his brother, and a year afterwards to his uncle, who had a business in Georgetown, District of Columbia. After serving as a volunteer at Fort Warburton, Maryland, in the war of 1812, he became partner with Elisha Riggs in a dry goods store at Georgetown, Riggs furnishing the capital, while Peabody was manager. Through his energy and skill the business increased with astounding rapidity, and on the retirement of Riggs about 1830 Peabody found himself at the head of one of the largest mercantile concerns in the world. About 1837 he established himself in London as merchant and money-broker at Wanford Court, in the city, and in 1843 he withdrew from the American business. The number of his benefactions to public objects was very large. He gave £50,000 for educational purposes at Danvers; £200,000 to found and endow a scientific institute in Baltimore; various sums to Harvard University; £700,000 to the trustees of the Peabody Educational Fund to promote education in the southern states; and £500,000 for the erection of dwelling-houses for the working-classes in London. He received from Queen Victoria the offer of a baronetcy, but declined it. In 1867 the United States Congress awarded him a special vote of thanks. He died in London on the 4th of November 1869; his body was carried to America in a British warship, and was buried in his native town.

See the *Life* (Boston, 1870) by Phebe A. Hanaford.

PEABODY, a township of Essex county, Massachusetts, U.S.A., in the eastern part of the state, 2 m. N.W. of Salem. Pop. (1905, state census), 13,098. It is served by the Boston & Maine railroad. The township covers an area of 17 sq. m. Its principal village is also known as Peabody. It contains the Peabody Institute (1852), a gift of George Peabody; in 1909 the institute had a library of 43,200 vols., and in connexion with it is the Eben Dale Sutton reference library, containing 4100 vols. in 1909. In the institute is the portrait of Queen Victoria given by her to Mr Peabody. Among the places of interest in the township are the birthplace of George Peabody, the home of Rufus Choate (who lived here from 1823 to 1828), and the old burying-ground, where many soldiers of the War of Independence are buried; and the town has a Lexington monument, dedicated in 1835, and a soldiers' monument, dedicated in 1881. Manufacturing is the principal industry, and leather is the principal product; among other manufactures are shoes, gloves, glue and carriages. The value of the factory products in 1905 was $10,236,669, an increase of 47·4 % over that for 1900, and of the total the leather product represented 77·3 %.

Peabody was originally a part of the township of Salem. In 1752 the district of Danvers was created, and in 1757 this district was made a separate township. In 1855 the township was divided into Danvers and South Danvers, and in 1868 the name of South Danvers was changed to Peabody, in honour of George Peabody.

See *Old Naumkeag* (Salem, 1877), by C. H. Webber and W. H. Nevins.

PEACE, a river of western Canada. It rises in the Rocky Mountains near 55° N., and breaking through the mountains, flows N.E. into Slave River, near lake Athabasca. The district between 56° 40′ and 60° N., and between 112° W. and the Rocky Mountains is usually known as the Peace River district.

PEACE (Lat. *pax*; Fr. *paix*; Ger. *Friede*), the contrary of war, conflict or turmoil, and the condition which follows their cessation. Its sense in international law is the condition of not being at war. The word is also used as an abridgment for a treaty of peace, in such cases as the Peace of Utrecht (1713) and the Peace of Amiens (1802).

Introduction.—Peace until quite recently was merely the political condition which prevailed in the intervals between wars. It was a purely negative condition. Even Grotius, who reduced the tendencies existing in his time to a sort of orderly expression, addressed himself to the law of war as the positive part of international jurisprudence and dealt only with peace as its negative alternative. The very name of his historic treatise, *De jure belli ac pacis* (1625), shows the subordination of peace to the main subject of war. In our own time peace has attained a higher status. It is now customary among writers on international law to give peace at any rate a volume to itself. Peace in fact has become a separate branch of the subject. The rise of arbitration as a method of settling international difficulties has carried it a step further, and now the Hague Peace Conventions have given pacific methods a standing apart from war, and the preservation of peace has become an object of direct political effort. The methods for ensuring such preservation are now almost as precise as the methods of war. However reluctant some states may be to bind themselves to any rules excluding recourse to brute force when diplomatic negotiations have failed, they have nevertheless unanimously at the Hague Conference of 1907 declared their "firm determination to co-operate in the maintenance of general peace" (*la ferme volonté de concourir au maintien de la paix générale*[1]), and their resolution "to favour with all their efforts the amicable settlement of international conflicts" (preamble to Peace Convention). The offer of mediation by independent powers is provided for (Peace Convention: art. 3), and it is specifically agreed that in matters of a "legal character" such as "questions of interpretation and application" of international conventions, arbitration is the "most efficacious and at the same time most equitable method" of settling differences which have not been solved by diplomacy (Peace Convention: art. 38). In the final act, the conference went farther in agreeing to the "principle of compulsory arbitration," declaring that "certain disputes, in particular those relating to the interpretation and application of the provisions of international agreements, are suitable (susceptible) to be submitted to compulsory arbitration without any restriction."

These declarations were obviously a concession to the widespread feeling, among all civilized nations, that peace is an object in itself, an international political condition requiring its code of methods and laws just as much as the domestic political conditions of nations require their codes of methods and laws. In other words peace among nations has now become, or is fast becoming, a positive subject of international regulation, while war is

[1] This has been incorrectly rendered in the English official translation as "the sincere desire to work for the maintenance of general peace."

coming, among progressive peoples, to be regarded merely as an accidental disturbance of that harmony and concord among mankind which nations require for the fostering of their domestic welfare.

Though the idea of preserving peace by general international regulation has had several exponents in the course of ages, no deliberate plan has ever yet been carried into effect. Indirectly, however, there have been many agencies which have operated towards this end. The earliest, known to history, is the Amphictyonic Council (*q.v.*) which grew out of the common worship of the Hellenes. It was not so much a political as a religious body. "If it had any claim," says Freeman,[1] "to the title of a general council of Greece, it was wholly in the sense in which we speak of general councils in modern Europe. The Amphictyonic Council represented Greece as an ecclesiastical synod represented western Christendom. Its primary business was to regulate the concerns of the temple of Apollo at Delphi. The Amphictyonic Council which met at Delphi was only the most famous of several bodies of the same kind." "It is easy, however," adds Freeman, "to understand how the religious functions of such a body might assume a political character. Thus the old Amphictyonic oath forbade certain extreme measures of hostility against any city sharing in the common Amphictyonic worship, and it was forbidden to raze any Amphictyonic city or to cut off its water. As the only deliberative body in which most Greek communities were represented, its decisions were those of the bulk of the Hellenic people. It sank eventually into a mere political tool in the hands first of Thebes, and then under Philip of Macedonia."

The so-called *pax romana* was merely peace within an empire governed from a central authority, the constituent parts of which were held together by a network of centralized authority.

The feudal system again was a system of offence and defence, and its object was efficiency for war, not the organized regulation of peace. Yet it had elements of federation within the bonds of its hierarchy.

The spiritual influence of the Church again was exerted to preserve relative peace among feudal princes. The "Truce of God" was established by the clergy (originally in Guyenne in 1031) to take advantage of holy days and festivals for the purpose of restricting the time available for bloodshed.

The "grand design" of Henry IV. (France), which some historians regard merely as the fantastic idea of a visionary, was probably a scheme of his great minister Sully to avert by a federation the conflict which he probably foresaw would break out sooner or later between Catholic and Protestant Europe, and which, in fact, broke out some fifteen years later in the Thirty Years' War.

The Holy Roman Empire itself was in some respects an agent for the preservation of peace among its constituent states. In the same way the federation of Swiss cantons, of the states of the North American Union and of the present German Empire have served as means of reducing the number of possible parties to war, and consequently that of its possible occasions.

Not only the number of possible war-making states but also the territorial area over which war can be made has been reduced in recent times by the creation of neutralized states such as Switzerland, Belgium, Luxemburg and Norway, and areas such as the Congo basin, the American lakes and the Suez Canal.

The "balance of power," which has played in the history of modern Europe such an important part, is inherent in the notion of the independence and stability of states. Just as in Italy the common weal of the different republics which were crowded within the limited area of the peninsula required that no one of them should become so powerful as to threaten the independence of the others, so western Europe had a similar danger to counteract. France, Spain and the Empire were competing with each other in power to the detriment of smaller states. Great Britain and the Netherlands, Prussia and Russia, had interests in the preservation of the *status quo*, and wars were waged and treaties concluded to adjust the strength of states in the common interest of preventing any one of them from obtaining undue predominance. Then came the break up of what remained of feudal Europe and a readjustment under Napoleon, which left the western world with five fairly balanced homogeneous nations. These now took the place of the old heterogeneous areas, governed by their respective sovereigns without reference to any idea of nationality or of national representation. The leading nations assumed the hegemony of the west, and in more recent times this combination has become known as the "concert of Europe." This concert of the great powers, as its name implies, in contradistinction to the "balance of power," was essentially a factor for the preservation of peace. For a century back it has played the part of an upper council in the management of Europe. In all matters affecting the Near East, it considers itself supreme. In matters of general interest it has frequently called conferences to which the minor states have been invited, such as the West African Conference in Berlin in 1885, and the Anti-Slavery Conference at Brussels in 1889–1890, and the Conference of Algeciras in 1906. Meanwhile the concert has admitted among its members first in 1856 Turkey, later in 1878 at the Congress of Berlin the United States, and now undoubtedly Japan will expect to be included as a great power in this controlling body. The essential feature of the concert has been recognition of the advantage to all the great powers of common action in reference to territorial changes in the Near East, of meeting together as a council, in preference to unconcerted negotiation by the powers acting severally.

A departure of more recent origin has been the calling together of the smaller powers for the settlement of matters of general administrative interest, conferences such as those which led to the conclusion of the conventions creating the Postal Union, the Copyright and Industrial Property Unions, &c.

These conferences of all the powers serve in practice as a sort of common council in the community of states, just as the concert of the great powers acts as a kind of senate. We have thus the nucleus of that international parliament which idealist peacemakers have dreamt of since the time of Henry IV.'s "grand design."

This brings us down to the greatest deliberate effort ever made to secure the peace of the world by a general convention. It was due to the initiative of the young tsar Nicolas II., who, in his famous rescript of the 24th of August 1898, stated that he thought that the then moment was "very favourable for seeking, by means of international discussion, the most effectual means of assuring to all peoples the benefits of a real and durable peace." "In the course of the last twenty years," added the rescript, "the preservation of peace had become an object of international policy." Economic crises, due in great part to the existing system of excessive armaments, were transforming armed peace into a crushing burden, which peoples had more and more difficulty in bearing. He therefore proposed that there should be an international conference for the purpose of focusing the efforts of all states which were "sincerely seeking to make the great idea of universal peace triumph over the elements of trouble and discord." The first conference was held in 1899, and another followed it in 1907: at the earlier one twenty-six powers were represented; at that of 1907 there were forty-four, this time practically the whole world. The conventions drawn up at the second conference were a deliberate codification of many branches of international law. By them a written law has been substituted for that unwritten law which nations had been wont to construe with a latitude more or less corresponding to their power. At the conference of 1899, moreover, a court of arbitration was instituted for the purpose of dealing judicially with such matters in dispute as the powers agreed to submit to it.

In the interval between the two Hague Conferences, Great Britain and France concluded the first treaty applicable to future difficulties, as distinguished from the treaties which had preceded it, treaties which related in all cases to difficulties already

[1] *History of Federal Government in Greece and Italy* (2nd ed., London, 1893), p. 97.

existing and confined to them. This treaty made arbitration applicable to all matters not affecting "national honour or vital interests." Since then a network of similar treaties, adopted by different nations with each other and based on the Anglo-French model, has made reference to the Hague Court of Arbitration practically compulsory for all matters which can be settled by an award of damages or do not affect any vital national interest.

The third Hague Conference is timed to be held in 1917. Meanwhile a conference of the maritime powers was held in London in 1908–1909 for the elaboration of a code of international maritime law in time of war, to be applied in the international Court of Prize, which had been proposed in a convention signed *ad referendum* at the Hague Conference of 1907.

A further development in the common efforts which have been made by different powers to assure the reign of justice and judicial methods among the states of the world was the proposal of Secretary Knox of the United States to insert in the instrument of ratification of the International Prize Court Convention (adopted at the Hague in 1897) a clause stating that the International Prize Court shall be invested with the duties and functions of a court of arbitral justice, such as recommended by the first *Vœu* of the Final Act of the conference. The object of this proposal was to give effect to the idea that the existing "permanent" court lacked the essential characteristics of national courts of justice in not being ready at all times to hear cases, and in needing to be specially constituted for every case submitted to it. The new court would be permanently in session at the Hague, the full panel of judges to assemble in ordinary or extraordinary session once a year.

Thus, while armaments are increasing, and wars are being fought out in the press and in public discussion, the great powers are steadily working out a system of written law and establishing a judiciary to adjust their differences in accordance with it.[1]

The Current Grouping of Mankind and Nation-making.—In the consolidation of peace one of the most important factors is unquestionably the grouping of mankind in accordance with the final territorial and racial limitations of their apparent destiny. Language has played a vital part in the formation of Germany and Italy. The language question still disturbs the tranquillity of the Near East. The Hungarian government is regarded by the Slav, Ruman and German inhabitants of the monarchy as an oppressor for endeavouring to force everybody within the realm to learn the Magyar language. The "Young Turkish" government has problems to face which will be equally difficult, if it insists on endeavouring to institute centralized government in Turkey on the French model.

Whereas during the 19th century states were being cut out to suit the existing distribution of language, in the 20th the tendency seems to be to avoid further rearrangement of boundaries, and to complete the homogeneity, thus far attained, by the artificial method of forcing reluctant populations to adopt the language of the predominant or governing race. In the United States this artificial method has become a necessity, to prevent the upgrowth of alien communities, which might at some later date cause domestic trouble of a perilous character. For example, when a community of French Canadians, discontented with British rule, many years ago migrated and settled in Massachusetts, they found none of the tolerance they had been enjoying in Canada for their French schools and the French language they wished to preserve. In Alsace-Lorraine German-speaking immigrants are gradually displacing, under government encouragement, the French-speaking population. Poland is another case of the difficulty of managing a population which speaks a language not that of the governing majority, and Russia, in trying to solve one problem by absorbing Finland into the national system, is burdening herself with another which may work out in centuries of unrest, if not in domestic violence. Not very long ago Pan-Germans were paying much attention to the German settlers in the Brazilian province of Rio Grande do Sul, where large villages spoke nothing but German, and German, as the only language known on the spot, had become the tongue in which municipal business was transacted. The Brazilian government, in view of the danger to which such a state of things might give rise, followed the example of the United States in dealing with the language question.

Thus while in the one case homogeneity of language within state boundaries seems to be one of the conditions making for peace, the avoidance of interference with a well-marked homogeneous area like Finland would seem to contribute equally to the same end.

Meanwhile the difficulties in the way of contemporary nation-making are fostered by many extraneous influences, as well as by dogged resistance of the races in question. Not the least important of these influences is the sentimental sympathy felt for those who are supposed to be deprived of the use of their mother-tongue, and who are subjected to the hardship of learning an alien one. The hardship inflicted on those who have to learn a second language is very easily exaggerated, though it is to be regretted that in the case of Hungary the second language is not one more useful for international purposes.

Contemporary Statecraft.—Nation-making has hitherto been more or less unconscious—the outcome of necessity, a natural growth due to the play of circumstance and events. But in our own age conscious statecraft is also at work, as in Canada, where the genius of statesmen is gradually endowing that dominion with all the attributes of independence and power. Australia has not learnt the lesson of Canada in vain. Whatever value may attach to the consolidation of the British Empire itself as a factor in spreading the peace which reigns within it, it is also a great contribution to the peace of the world that the British race should have founded practically independent states like the Dominion of Canada, the Commonwealth of Australia, the South African Union and the Dominion of New Zealand. These self-governing colonies with their spheres of influence, with vast areas still unpeopled, have a future before them which is dissociated from the methods of an over-peopled Europe, and among them the preservation of peace is the direct object and condition of their progressive development. Like the United States, they have or will have their Monroe doctrine. Colonized by the steady industrial peoples of northern Europe, there is no danger of the turbulence of the industrially indolent but more passionate peoples of Central and South America. As in Europe, these northern peoples will hold the power which intelligent democracies are consciously absorbing, and the British faculty for statecraft is gradually welding new nations on the British model, without the obsolete traditions and without that human sediment which too frequently chokes the currents of national vitality in the older communities of Europe.

Militarism.—It is often stated, as if it were incontrovertible, that conscription and large standing armies are a menace to peace, and yet, although throughout the civilized world, except in the British Empire and the United States, conscription is the system employed for the recruiting of the national forces of both defence and offence, few of these countries show any particular disposition to make war. The exceptional position of the United States, with a population about equal to that of the rest of the American continent, and of Great Britain, an island state but little exposed to military invasion, places both beyond absolute need of large standing armies, and renders an enlisting system feasible which would be quite inadequate for the recruitment of armies on the French or German scale. Democratic progress on the Continent has, however, absorbed

[1] Schemes of thinkers, like William Penn's European Parliament (1693); the Abbé St Pierre's elaboration (*c.* 1700) of Henry IV.'s "grand design" (see *supra*); Jeremy Bentham's *International Tribunal* (1786–1789); Kant's *Permanent Congress of Nations and Perpetual Peace* (1796); John Stuart Mill's *Federal Supreme Court*; Seeley's, Bluntschli's, David Dudley Field's, Professor Leone Levi's, Sir Edmund Hornby's co-operative schemes for promoting law and order among nations, have all contributed to popularizing in different countries the idea of a federation of mankind for the preservation of peace.

conscription as a feature in the equalization of the citizen's rights and liabilities. Just as in Anglo-Saxon lands a national ideal is gradually materializing in the principle of the equalization of chances for all citizens, so in continental Europe, along with this equalization of chances, has still more rapidly developed the ideal of an equalization of obligations, which in turn leads to the claim for an enlargement of political rights co-extensive with the obligations. Thus universal conscription and universal suffrage tend to become in continental political development complementary conditions of the citizen's political being. In Germany, moreover, the military service is designed not only to make the recruit a good soldier, but also to give him a healthy physical, moral and mental training. German statesmen, under the powerful stimulus of the emperor William II., have, in the eyes of some critics, carried this secondary object of conscript training to such excess as to be detrimental to military efficiency. To put it shortly, the Germans have taught their soldiers to think, and not merely to obey. The French, who naturally looked to German methods for inspiration, have come to apply them more particularly in the development of their cavalry and artillery, especially in that of the former, which has taken in the French army an ever higher place as its observing and thinking organ.

Militarism on the Continent has thus become allied with the very factors which make for the reign of reason. No agitation for the development of national defences, no beating of drums to awaken the military spirit, no anti-foreign clamour or invasion panic, no parading of uniforms and futile clash of arms, are necessary to entice the groundling and the bumpkin into the service. In Germany patriotic waving of the flag, as a political method, is directed more especially to the strengthening of imperial, as distinguished from local, patriotism. Where conscription has existed for any appreciable time it has sunk into the national economy, and men do their military service with as little concern as if it were a civil apprenticeship.

As implied above, military training under conscription does not by any means necessarily tend to the promotion of the military spirit. In France, so far from taking this direction, it has resulted, under democratic government and universal suffrage, in a widespread abhorrence of war, and, in fact, has converted the French people from being the most militant into being the most pacific nation in Europe. The fact that every family throughout the land is a contributory to the military forces of the country has made peace a family, and hence a national, ideal. Paradoxical as it may seem, it is the logical conclusion of such comparisons that militarism only exists in countries where there are no citizen armies, and that, where there are citizen armies, they are one of the elements which make for permanent peace.

Normal Nature of Peace.—America has been the pioneer of the view that peace is the normal condition of mankind, and that, when the causes of war are eliminated, war ceases to have a *raison d'être*. The objects and causes of war are of many kinds. War for fighting's sake, although in the popular mind there may be, during most wars, only the excitement and the emotion of a great gamble, has no conscious place among the motives of those who determine the destinies of peoples. Apart, however, from self-defence, the main causes of war are four: (1) The desire for territorial expansion, due to the overgrowth of population, and insufficiency of the available food-supply; if the necessary territory cannot be obtained by negotiation, conquest becomes the only alternative to emigration to foreign lands. (2) The prompting of national ambition or a desire to wipe out the record of a humiliating defeat. (3) Ambitious potentates again may seek to deflect popular tendencies into channels more satisfactory for their dynasty. (4) Nations, on the other hand, may grow jealous of each other's commercial success or material power. In many cases the apparent cause may be of a nobler character, but historians have seldom been content to accept the allegations of those who have claimed to carry on war from disinterested motives.

On the American continent South and Central American states have had many wars, and the disastrous effects of them not only in retarding their own development, but in impairing their national credit, have led to earnest endeavours on the part of their leading statesmen to arrive at such an understanding as will banish from their international polity all excuses for resorting to armed conflicts. In 1881 Mr Blaine, then U.S. secretary of state, addressed an instruction to the ministers of the United States of America accredited to the various Central and South American nations, directing them to invite the governments of these countries to participate in a congress, to be held at Washington in 1882, "for the purpose of considering and discussing the methods of preventing war between the nations of America." Owing to different circumstances the conference was delayed till the autumn of 1889. At this conference a plan of arbitration was drawn up, under which arbitration was made obligatory in all controversies whatever their origin, with the single exception that it should not apply where, in the judgment of any one of the nations involved in the controversy, its national independence was imperilled, and even in this case arbitration, though optional for the nation so judging, was to be obligatory for the adversary power. At the second International Conference of American States, which sat in the city of Mexico from the 22nd of October 1901 to the 31st of January 1902, the same subject was again discussed, and a scheme was finally adopted as a compromise which conferred authority on the government of Mexico to ascertain the views of the different governments represented in the conference, regarding the most advanced form in which a general arbitration convention could be drawn up that would meet with the approval and secure ratification by all the countries represented, and afterwards to prepare a plan for such a general treaty. The third Pan-American Conference was held in the months of July and August 1906, and was attended by the United States, Argentina, Bolivia, Brazil, Chile, Colombia, Costa Rica, Cuba, the Dominican Republic, Ecuador, Guatemala, Honduras, Mexico, Nicaragua, Panama, Paraguay, Peru, Salvador and Uruguay. Only Haiti and Venezuela were absent. The conference, being held only a year before the time fixed for the second Hague Conference, applied itself mainly to the question of the extent to which force might be used for the collection of pecuniary claims against defaulting governments, and the forwarding of the principle of arbitration under the Hague Conventions. The possible causes of war on the American continent had meanwhile been considerably reduced. Different states had adjusted their frontiers, Great Britain in British Guiana had settled an outstanding question with Venezuela, France in French Guiana another with Brazil, Great Britain in Newfoundland had removed time-honoured grievances with France, Great Britain in Canada others with the United States of America, and now the most difficult kind of international questions which can arise, so far as the American continent is concerned, have been removed from among existing dangers to peace. Among the Southern Republics Argentina and Chile concluded in 1902 a treaty of arbitration, for the settlement of all difficulties without distinction, combined with a disarmament agreement of the same date, to which more ample reference will be made hereafter. Thus in America progress is being rapidly made towards the realization of the idea that war can be superannuated by elimination of its causes and the development of positive methods for the preservation of peace (see Pan-American Conferences).

With the American precedent to inspire him, the emperor Nicolas II. of Russia in 1898 issued his invitation to the powers to hold a similar conference of European states, with a more or less similar object. In 1899 twenty-six states met at the Hague and began the work, which was continued at the second conference in 1907, and furthered by the Maritime Conference of London of 1908–1909. The creation of the Hague Court and of a code of law to be applied by it have further eliminated causes of difference.

These efforts in the two hemispheres are based on the idea

that international differences can be adjusted without war, where the parties are honestly aggrieved. With this adjustment of existing cases the number of possible pretexts for the employment of force is being rapidly diminished.

Peace Procedure under the Hague Conventions.—The Hague peace Convention of 1907, which re-enacts the essential parts of the earlier one of 1899, sets out five ways of adjusting international conflicts without recourse to war. Firstly, the signatory powers have undertaken to use their best efforts to ensure the pacific settlement of international difficulties. This is a general declaration of intention to lend themselves to the peaceable adjustment of difficulties and employ their diplomacy to this end. Secondly, in case of serious disagreement, diplomacy having failed, they agree to have recourse, as far as circumstances allow, to the good offices or mediation of one or more friendly powers. Thirdly, the signatory powers agree that it shall not be regarded as an unfriendly act if one or more powers, strangers to the dispute, on their own initiative offer their good offices or mediation to the states in disagreement, or even during hostilities, if war has already broken out. Fourthly, the convention recommends that in disputes of an international nature, involving neither national honour nor vital interests, and arising from a difference of opinion on points of fact, the parties who have not been able to come to an agreement by means of diplomacy should institute an international commission of inquiry to facilitate a solution of these disputes by an investigation of the facts. Lastly, the high contracting parties have agreed that in questions of a legal nature, and especially in interpretation or application of international conventions, arbitration is recognized as the most effective, and at the same time the most equitable, means of settling disputes which diplomacy has failed to adjust.

Down to 1910 no suggestion of mediation had actually been carried out, but a number of cases of arbitration had been tried by the Hague Court, created by the Hague Peace Convention (see ARBITRATION, INTERNATIONAL), and one case, viz. that of the Dogger Bank incident, was submitted to a commission of inquiry, which sat in January 1905.[1]

If Secretary Knox's proposal (see *supra*) to convert the International Prize Court into a permanently sitting court of arbitration is adopted, a detailed procedure and jurisprudence will no doubt grow out of a continuity which is lacking in the present system, under which the court is recruited from a large panel for each special case. Secretary Knox's idea, as expressed in the identical circular note addressed by him on the 18th of October 1909 to the powers, was to invest the International Prize Court, proposed to be established by the convention of the 18th of October 1907, with the functions of a "court of arbitral justice." The court contemplated by the convention was a court of appeal for reviewing prize decisions of national courts both as to facts and as to the law applied, and, in the exercise of its judicial discretion, not only to confirm in whole or in part the national decision or the contrary, but also to certify its judgment to the national court for enforcement thereof. The adoption of this jurisdiction would have involved a revision of the judicial systems of probably every country accepting it. The United States government therefore proposed that the signatories should insert in the act of ratification a reservation to the effect that resort to the International Prize Court, in respect of decisions of their national tribunals, should take the form of a direct claim for compensation. This in any case would remove the United States' constitutional objection to the establishment of the proposed court. In connexion with this enabling clause Mr Secretary Knox also proposed that a further enabling clause be inserted providing that the International Court of Prize be competent to accept jurisdiction in all matters, arising between signatories, submitted to it, the Court to sit at fixed periods every year and to be composed according to the panel which was drawn up at the Hague. This court, which the American government proposed to call a "Court of Arbitral Justice," would take the place of that which it was proposed to institute under *Vœu* No. 1 of the Final Act of the conference of 1907. The intention of the Hague draft annexed to the *Vœu* was to create a permanent court as distinguished from that established in 1899, which, though called permanent, was not so, having to be put together *ad hoc* as the occasion arose. The new court, if adopted, would hold regular and continuous sessions, consist of the same judges, and pay due heed to the precedents created by its prior decisions. The two courts would have separate spheres of activity, and litigants would practically have the option of submitting their differences to a judicial court which would regard itself as being bound by the letter of the law and by judicial methods or to a special court created *ad hoc* with a purely arbitrative character.

The Place of Diplomacy.—The utility of the diplomatic service has been considerably diminished through the increasing efficiency of the public press as a medium of information. It is not too much to say that at the present day an experienced journalist, in a place like Vienna or Berlin, can give more information to an ambassador than the ambassador can give to him. It is even true to say that an ambassador is practically debarred from coming into actual touch with currents of public feeling and the passing influences which, in this age of democracy, determine the course of events in the political life of peoples. The diplomatist has therefore lost one of his chief functions as an informant of the accrediting government. The other chief function of diplomacy is to be the courteous medium of conveying messages from one government to another. Even this function is losing its significance. The ciphered telegram leaves little discretion to the envoy, and written notes are exchanged which are practically a mere transcription of the deciphered telegram or draft prepared at the instructing foreign office. Nevertheless, the personality of an ambassador can play a great part, if he possesses charm, breadth of understanding and interest in the social, intellectual and industrial life of the country to which he is accredited. There are several instances of such men in Europe and America, but they are so rare that some reformers consider them as hardly justifying the large expenditure necessary to maintain the existing system. On the other hand, the utility of the consular service has concurrently increased. Administrative indifference to the eminently useful officials forming the service has led, in many cases, to diminishing instead of increasing their number and their salaries, but it is obvious that the extension of their duties and a corresponding raising of their status would be much more in accordance with the national interest. The French, with that practical sense which distinguishes so much of their recent administrative work, have connected the two services. A consul-general can be promoted to a diplomatic post, and take with him to his higher office the practical experience a consul gains of the material interests of the country to which he belongs.

There is thus still good work for diplomacy to do, and if, in the selection of diplomatic representatives, states followed on the one hand the above-mentioned French example, and on the other hand the American example of selecting for the heads of diplomatic missions men who are not necessarily *de la carrière*, diplomacy might obtain a new lease of activity, and become once more an extremely useful part of the administrative machinery by which states maintain good business relations as well as friendly political intercourse with one another.

International Regulation by Treaty.—It seems a truism to say that among the agencies which most effectively tend to the preservation of peace are treaties which regulate the relations of states in their intercourse with other states. Such treaties, however, are of quite recent origin. The first of a comprehensive

[1] The procedure adopted by the commission was afterwards incorporated in the convention of 1907. Under the rules adopted, the examination of witnesses is conducted by the president in accordance with the system prevailing in most continental countries; members of the commission may only put questions to witnesses for the eliciting of further information; and they may not interrupt the witness when he is in course of making his statement, but they may ask the president to put any additional questions. This seems likely to become the procedure also in cases before the Hague Court, where witnesses are examined.

character was the *general act* adopted at the South African Conference at Berlin in 1885, which laid down the principle, which has since become of still wider application, that "any Power which henceforth takes possession of a tract of land on the coast of the African continent outside of its present possessions or which, being hitherto without such possessions, shall acquire them . . . shall accompany the act relating to it with a notification thereof, addressed to the other Signatory Powers of the present act, in order to enable them, if need be, to make good any claims of their own," and, furthermore, that "the Signatory Powers of the present act recognize the obligation to ensure the establishment of authority in the regions occupied by them on the coasts of the African continent sufficient to protect existing rights, and, as the case may be, freedom of trade and transit under the conditions agreed upon." Under these articles occupation of unoccupied territory to be legal had to be effective. This led to the creation and determination of *spheres of influence*. By fixing the areas of these spheres of influence rival states in western and central Africa avoided conflicts and preserved their rights until they were able to take a more effective part in their development. The idea of "spheres of influence" has in turn been applied even to more settled and civilized countries, such as China and Persia.

Other cases of regulation by treaty are certain contractual engagements which have been entered into by states for the preservation of the *status quo* of other states and territories.

The Anglo-Japanese Treaty of the 12th of August 1905 sets out its objects as follows:—

a. "The consolidation and maintenance of the general peace in the regions of Eastern Asia and India;

b. "The preservation of the common interests of the Powers in China, of insuring the independence and the integrity of the Chinese empire, and the principle of equal opportunities for the commerce and industry of all nations in China;

c. "The maintenance of the territorial rights of the high contracting parties in the regions of Eastern Asia and of India, and the defence of their special interests in such regions."

It is a treaty for the maintenance of the *status quo* in certain parts of Asia in which the parties to it have dominant interests. The same principle underlies different other self-denying arrangements and declarations made by the powers with reference to Chinese integrity.

The Treaty of Algeciras is essentially a generalization of the Franco-German agreement of the 28th of September 1905. By it all the powers represented agree to respect the territorial integrity of Morocco, subject to a possible intervention limited to the purpose of preserving order within it.

Differing from these *general acts* in not being contractual is the Monroe doctrine, which is a *policy* of ensuring the maintenance of the territorial *status quo* as regards non-American powers throughout the American continent. If necessary, the leading republics of South and Central America would no doubt, however, further ensure respect for it by treaty.

With these precedents and current instances of tendency to place the territorial relations of the powers on a permanent footing of respect for the existing *status quo*, it seems possible to go beyond the mere enunciation of principles, and to take a step towards their practical realization, by agreeing to respect the territorial *status quo* throughout still larger tracts of the world, neutralize them, and thus place them outside the area of possible wars.

A third contractual method of avoiding conflicts of interest has been the signing of agreements for the maintenance of the "open-door." The discussion on the question of the "open-door" in connection with the Morocco difficulty was useful in calling general public attention once more to the undesirability of allowing any single power to exclude other nations from trading on territory over which it may be called to exercise a protectorate, especially if equality of treatment of foreign trade had been practised by the authority ruling over the territory in question before its practical annexation under the name of protectorate. The habitable parts of the world are a limited area, exclusion from any of which is a diminution of the available markets of the nations excluded. Every power, is, therefore, rightfully interested in the prevention of such exclusion.

The United States government in 1899 called attention to the subject as regards China, without, however, going into any question of principle. It thought that danger of international irritation might be removed by each power making a declaration respecting the "sphere of interest" in China to which it laid claim. Lord Salisbury informed Mr Choate that H.M. government were prepared to make a declaration in the sense desired. All the powers concerned eventually subscribed to the declaration proposed by the United States government.

The principle of the "open-door" in fact has already been consistently applied in connexion with certain non-European areas. As these areas are practically the only areas which of late years have come within the scope of European regulation, the time seems to be approaching when the principle may be declared to be of general application. From the point of view of diminishing the possible causes of conflict among nations, the adoption of this principle as one of international contractual obligation would be of great utility. While putting an end to the injustice of exclusion, it would obviously reduce the danger of nations seeking colonial aggrandizement with a view to imposing exclusion, and thus one of the chief temptations to colonial adventure would be eliminated.

In the fourth place, there is the self-denying ordinance against employment of arms for the enforcement of contractual obligations adopted at the Hague Conference of 1907. Under it the high contracting powers have agreed not to have recourse to armed force for the recovery of contractual debts claimed from the government of one country by the government of another country as due to its subjects. The only qualification admitted under the new convention is that it shall not apply when the debtor-state refuses or leaves unanswered an offer of arbitration, or in case of acceptance renders the settlement of the terms of arbitration impossible, or, after arbitration, fails to comply with the award. The theory on which this convention is based is known as the Drago theory, having taken a practical form during the administration of Dr L. M. Drago, when he filled the post of Argentine minister of foreign affairs. The doctrine, however, is not new, having already been enunciated a century before by Alexander Hamilton and reiterated since then by several American statesmen, such as Albert Gallatin, William L. Marcy and F. T. Frelinghuysen, as the view prevailing at Washington during their respective periods of office.

Limitations of Disarmament.—Disarmament, or to speak more correctly, the contractual limitation of armaments, has become, of late years, as much an economic as a humanitarian peace-securing object.

"The maintenance of universal peace and a possible reduction of the excessive armaments which weigh upon all nations, represent, in the present condition of affairs all over the world, the ideal towards which the efforts of all governments should be directed," were the opening words of the Note which the Russian Minister of Foreign Affairs, Count Mouraviev, handed to the diplomatic representatives of the different powers suggesting the first Hague Conference.

"The ever-increasing financial burdens," the Note went on, "strike at the root of public prosperity. The physical and intellectual forces of the people, labour and capital, are diverted for the greater part from their natural application and wasted unproductively. Hundreds of millions are spent in acquiring terrible engines of destruction, which are regarded to-day as the latest inventions of science, but are destined to-morrow to be rendered obsolete by some new discovery. National culture, economic progress and the production of wealth are either paralysed or developed in a wrong direction. Therefore the more the armaments of each power increase the less they answer to the objects aimed at by the governments. Economic disturbances are caused in great measure by this system of excessive armaments; and the constant danger involved in this accumulation of war material renders the armed peace of to-day a crushing

burden more and more difficult for nations to bear. It consequently seems evident that if this situation be prolonged it will inevitably result in the very disaster it is sought to avoid, and the thought of the horrors of which makes every humane mind shudder. It is the supreme duty, therefore, of all states to place some limit on these increasing armaments, and find some means of averting the calamities which threaten the whole world."

A further Note submitting the programme proposed gave more precision to this item, which thereupon took the following form: "An understanding not to increase for a fixed period the present effectives of the armed military and naval forces, and at the same time not to increase the budgets pertaining thereto; and a preliminary examination of the means by which even a reduction might be effected in future in the forces and budgets above mentioned."

When the subject came on for discussion at the conference the German military delegate stated his view that the question of effectives could not be discussed by itself, as there were many others to which it was in some measure subordinated, such, for instance, as the length of service, the number of cadres whether existing in peace or made ready for war, the amount of training received by reserves, the situation of the country itself, its railway system, and the number and position of its fortresses. In a modern army all these questions went together, and national defence included them all. In Germany, moreover, the military system "did not provide for fixed numbers annually, but increased the numbers each year."

After many expressions of regret at finding no method of giving effect to the proposal, the commission confined itself to recording its opinion that "a further examination of the question by the Powers would prove a great benefit to humanity."

The Conference, however, were unanimous in the adoption of the following resolution:—

"The Conference is of opinion that the restriction of military budgets, which are at present a heavy burden on the world, is extremely desirable for the increase of the material and moral welfare of mankind;"

and it passed also the following *vœu*:—

"That governments, taking into account the proposals made at the Conference, should examine the possibility of an understanding concerning the limitation of military and naval armaments, and of war budgets."

The general public, more particularly in Great Britain and France, shows an ever-increasing distrust of the rapid growth of armaments as a possible cause of grave economic troubles. A high state of military preparedness of any one state obliges all the others to endeavour to be prepared on the same level. This process of emulation, very appropriately called by the late Sir H. Campbell-Bannerman "a policy of huge armaments," unfortunately is a policy from which it is impossible for any country to extricate itself without the co-operation, direct or indirect, of other nations.

The subject was brought forward in view of the second Hague Conference in both the French and Italian parliaments.

The declaration of the French government stated that:—

"France hoped that other nations would grow, as she had done, more and more attached to solutions of international difficulties based upon the respect of justice, and she trusted that the progress of universal opinion in this direction would enable nations to regard the lessening of the present military budgets, declared by the states represented at the Hague to be greatly desirable for the benefit of the material and moral state of humanity, as a practical possibility." (Chamber of Deputies, June 12, 1906.)

In the Italian Chamber of Deputies, an interpellation was addressed to the minister of foreign affairs about the same time asking "whether the Government had knowledge of the motion approved by the British House of Commons, and of the undertaking of the British government that, in the programme of the coming Hague Conference, the question of the reduction of armaments should be inserted, and in what spirit the Italian government had taken or proposed to take the propositions of the British government, and what instructions it would give to the Italian representatives at the conference."

The minister of foreign affairs, M. Tittoni, in reply expressed the adhesion of the Italian government to the humanitarian ideas which had met with such enthusiasm in the historic House of Parliament at Westminster. "I have always believed," he said, "that, as far as we are concerned, it would be a national crime to weaken our own armaments while we are surrounded by strongly armed European nations who look upon the improvement of armaments as a guarantee of peace. Nevertheless, I should consider it a crime against humanity not to sincerely co-operate in an initiative having for object a simultaneous reduction of armaments of the great powers. Italian practice has always aimed at the maintenance of peace; therefore, I am happy to be able to say that our delegates at the coming Hague Conference will be instructed to further the English initiative."

The only existing case of contractual reduction of armaments is that of the Disarmament Agreement of the 28th of May 1902 between the Chilian and Argentine republics, adopted "owing to the initiative and good offices of His Britannic Majesty," which is as follows:—

Art. I.—In order to remove all cause of fear and distrust between the two countries, the governments of Chile and of the Argentine Republic agree not to take possession of the warships which they are having built, or for the present to make any other acquisitions. The two governments furthermore agree to reduce their respective fleets, according to an arrangement establishing a reasonable proportion between the two fleets. This reduction to be made within one year from the date at which the present agreement shall be ratified.

Art. II.—The two governments respectively promise not to increase their maritime armaments during five years, unless the one who shall wish to increase them shall give the other eighteen months' notice in advance. This agreement does not include any armaments for the purpose of protecting the shore and ports, and each party will be at liberty to acquire any vessels (*maquina flotante*) intended for the protection thereof, such as submarines, &c.

Art. III.—The reductions (*i.e.* ships disposed of) resulting from this agreement will not be parted with to countries having any dispute with either of the two contracting parties.

Art. IV.—In order to facilitate the transfer of the pending orders the two governments agree to increase by two months the time stipulated for the beginning of the construction of the respective ships. They will give instructions accordingly.

An agreement of this kind is obviously more feasible as among states whose navies are small and of comparatively recent origin than among states whose navies are composed of vessels of many and widely different ages. It may be difficult to agree in the latter case on a principle for assessment of the proportionate fighting value of the respective fleets. The break-up or sale of obsolete warships is a diminution of the paper effective of a navy, and their purchase by another state a paper increase of theirs. Even comparatively slight differences in the ages of ships may make great differences in their fighting value. It would be a hard, though probably not insurmountable, task to establish "a reasonable proportion," such as provided for in Art. II. of the Chile-Argentina Agreement, as between large and old-standing navies like those of Europe.

On the other hand, as regards military power, it seems sometimes forgotten in the discussion of the question of armaments, that the conditions of the present age differ entirely from those of the time of the Napoleonic wars. With conscription a national army corresponds more or less numerically to the proportion of males in the national population. Great Britain, without conscription, has no means of raising troops in any such proportion. Thus, so long as she refrains from adopting conscription, she can only carry on defensive warfare. The object of her navy is therefore necessarily defensive, unless it act in co-operation with a foreign conscript army. As there are practically only three great armies available for the purpose of a war of aggression, the negotiation of contingent arrangements does not seem too remote for achievement by skilful and really well-meaning negotiation. The Hague Conference of 1907, owing to difficulties which occurred in the course of the preliminary negotiations for the conference, did not deal with the subject.

Principle and Capabilities of Neutralisation.—Among the different methods which have grown up practically in our own

time for the exclusion of war is neutralization. We have been dealing hitherto with the elimination of the causes of war; neutralization is a curtailment of the areas of war and of the factors in warfare, of territory on the one hand and states on the other. The neutralization of territory belonging to states which are not otherwise neutralized includes the neutralization of waterways such as the Suez and Panama canals.

Under the General Act of Berlin of the 26th of February 1885, "in case a power exercising rights of sovereignty or protectorate" in any of the regions forming the basin of the Congo and its affluents, including Lake Tanganyika, and extending away to the Indian Ocean, should be involved in a war, the parties to the General Act bound themselves to lend their good offices in order that the territories belonging to this power be placed during the war "under the rule of neutrality and considered as belonging to a neutral state, the belligerents thenceforth abstaining from extending hostilities to the territories thus neutralized, and from using them as a basis for warlike operations" (art. 2).

Neutralization is not necessarily of general application. Thus two states can agree to neutralize specific territory as between them. For example between Costa Rica and Nicaragua by a treaty of the 15th of April 1858 the parties agreed that "on no account whatever, not even in case of war," should "any act of hostility be allowed between them in the port of San Juan del Norte nor on the river of that name nor on Lake Nicaragua" (art. 2).[1]

Again, the Straits of Magellan are neutralized as between Argentina and Chile under a treaty of the 23rd of July 1881. Article 5 provides that they are "neutralized for ever and their free navigation is guaranteed to the flags of all nations. To ensure this neutrality and freedom it is agreed that no fortifications or military defences which might interfere therewith shall be erected."

Luxemburg was declared by the Treaty of London of the 11th of May 1867 (art. 1) to be a perpetually neutral state under the guarantee of Great Britain, Austria, Prussia and Russia. Switzerland, by a declaration confirmed by the Treaty of Vienna, of 1815 (art. 84), likewise enjoys perpetual neutrality. And now Norway has placed herself under a neutral régime of a similar character.

A neutralized state does not mean a state which is forbidden to have fortifications or an army; in this it differs from neutralized territory of a state not otherwise neutralized. Thus Belgium, which is a neutralized state, not only has an army but has fortifications, although by the treaties of 1831 and 1839 she was recognized as a "perpetually neutral state, bound to observe the same neutrality with reference to other states."

Of waterways, international rivers have been the chief subject of neutralization. It has long been an established principle in the intercourse of nations, that where the navigable parts of a river pass through different countries their navigation is free to all. The rivers Scheldt and Meuse were opened up in this way to riparian states by a decree of the French Convention of the 16th of November 1792. By the treaty of Vienna of the 9th of June 1815, the powers whose territories were separated or traversed by the same navigable river, undertook to regulate by common consent all that regarded its navigation, and for this purpose to name commissioners who should adopt as the bases of their proceedings the principle that the navigation of such rivers along their whole course "from the point where each of them becomes navigable to its mouth, shall be entirely free, and shall not in respect of commerce be prohibited to anyone." The only case in Europe in which this internationalization of rivers has been maintained is that of the Danube. On the other hand neutralization has made progress in respect of waterways, natural as well as artificial. Thus the Bosporus and Dardanelles under the Treaty of Paris of 1856 and by the Treaty of London 1871 were and remain closed to the passage of foreign armed vessels in time of war, though the Porte may permit their passage in time of peace in certain cases. The Suez and the Panama canals have been permanently neutralized, the former by a convention among the great powers, and the latter by a treaty between Great Britain and the United States.

[1] Under the treaty of the 29th of March 1864, the courts of Great Britain, France and Russia in their character of guaranteeing powers of Greece declared with the assent of the courts of Austria and Prussia that the islands of Corfu and Paxo as well as their dependencies should, after their union to the Hellenic kingdom, enjoy the advantages of perpetual neutrality, and the king of the Hellenes undertook on his part to maintain such neutrality. (Art. 2).

Alongside this neutralization has grown up a collateral institution, the purpose of which is in some respects similar. We refer to "buffer" zones. "Buffer" zones are of quite recent origin as a political creation,[2] *i.e.* where their object is to establish upon the territory of two contiguous states a strip or zone on either side of the frontier which the respective states *agree to regard* as neutral, on which the parties undertake to erect no fortifications, and maintain no armed forces but those necessary to enforce the ordinary respect of government. The word "neutral" does not correctly describe the character of the zone. It is not neutral in the sense of being recognized as such by any third state, and it necessarily ceases to be neutral in case of war between the states concerned. The word "buffer" comes nearest to the object, but even this term implies more than is meant. Between Spain and Morocco a treaty of the 5th of March 1894 established between the Camp of Melilla and Moroccan territory a zone within which no new roads were to be made, no herds to be allowed to graze, no land to be cultivated, no troops of either party, or even private persons carrying arms, to set foot, no inhabitants to dwell, and all habitations to be razed. The zone between Burma and Siam, established by an agreement between Great Britain and France dated the 15th of January 1896, declared "the portion of Siam which is comprised within the drainage basin of the Menam, and of the coast streams of a corresponding longitude," neutral as between them. Within this area the two powers undertook not to "operate by their military or naval forces, except in so far as they might do so in concert for any purpose requisite for maintaining the independence of Siam." They also undertook not to acquire within that area any privileges or commercial facilities not extended to both of them.

"Buffer" zones might fulfil a useful purpose even in Europe. They would obviously react against the feeling known as "esprit de frontière," and diminish the danger of incidents arising out of this feeling, and might attenuate the rivalry of neighbouring counter-armaments.

These considerations no doubt led the Swedish and Norwegian governments, in their settlement of September 1905, to establish a "buffer" zone of 15 kilometres on either side of the frontier between the two states in question. Within these 30 kilometres all existing fortresses are dismantled,[3] no new ones are to be erected, and no armed troops to be maintained; any question between the two states relative to the provisions respecting the "buffer" zone to be decided by arbitration.

A rather special case of neutralization of a territorial area

[2] The institution of "buffer" zones in a more strictly correct sense of the term is of very ancient origin. One is mentioned in the annals of China two centuries before our era, between the territories of the Huns in the west and those of the Tunguses in the east—a vast area of some 300 to 400 m., on the opposite margin of which the two peoples kept watch. In Europe, bands of territory from time to time have been made desert to better establish separation. The Romans and Germans protected themselves in this way. In the middle ages the Teutonic Order established a frontier belt on the side of Lithuania. Later, Austria dealt in the same way in her policy in regard to Turkey in the organization of a "military frontier." See Nys, *Droit International* (Brussels, 1904), i. 418.

[3] It was stipulated that the dismantling should be controlled by a technical commission of three officers of foreign nationality, to be chosen, one by each of the contracting powers and the third by the two officers thus appointed, or, in default of an agreement on their part, by the president of the Swiss Confederation. The dismantling of the forts in question has now been carried out. The Commission was composed on the part of Sweden of an engineer on the staff of the Austrian army, and on the part of Norway of a colonel in the German army, and, by agreement of these, of a colonel in the Dutch army.

is that of the practical neutralization of the Great Lakes in America. In 1817, at the instance of John Quincy Adams, the United States and Great Britain entered into a compact whereby the Great Lakes, and the waterways from them to the ocean by the St Lawrence river, which divide the United States from the Dominion of Canada, were practically excluded from any possible hostilities. Through a simple agreement, "conditions which make for peace and prosperity, and the absence of those which so often lead to disastrous war, have for nearly a century reigned over these great inland waters, whose commerce, conducted for the benefit of the states and nations of Europe and America, rivals that which passes through the Suez Canal or over the Mediterranean Sea, and with a result foreshadowed in these words of President Monroe in his communication to the Senate commending the proposed agreement: 'In order to avoid collision and save expense.' Forts which had been erected at salient points on either side of the lakes and rivers dividing the United States from Canada, which but for this agreement would, in the natural course of events, have been enlarged, increasingly garrisoned, and provided with modern implements of destruction, at large expense, have remained substantially as when the agreement was made, or now constitute but interesting or picturesque ruins; and the great cost of constructing and maintaining, through a long series of years, naval armaments of ever-increasing power has been avoided." [1]

As we have already said, the Monroe doctrine is a means of excluding European warfare from the American continent and therefore is in the nature of a form of neutralization. A sort of Monroe doctrine is growing into popular favour also throughout the Australian Commonwealth, where it is felt that a continent so far removed from European rivalries ought not to be exposed to complications on account of them.

From time to time questions of adding to existing neutralized areas are raised. When it was announced in 1905 that a British fleet was about to manœuvre in the Baltic Sea, several German newspapers suggested that Germany should combine with other Baltic powers to assure its neutralization.[2] No official observation on the subject, however, was made on the part of any Baltic power. The Baltic is still an open sea for the whole world, without restriction of any kind; and even hostilities between any two non-Baltic powers could be carried on in the Baltic, as elsewhere on the high sea, under the existing practice.

When the Dogger Bank incident occurred, the possibility of operations of war being carried on within a few miles of British home ports, and amid the busy traffic of the North Sea, was brought vividly home to British minds.

A movement set on foot at the instance of Edward Atkinson, the well-known Boston economist, and warmly supported by the Massachusetts State Board of Trade, seeks to establish by treaty neutral zones from the ports of North America to the ports of Great Britain and Ireland and the continent of Europe, within which zones steamship and sailing vessels in the conduct of lawful commerce should be free to pass without seizure or interruption in time of war. There is however no precedent of neutralization of any such area of the high sea, and international rivers, ocean canals and neutralized states are obviously no criterion in discussing a proposal to neutralize a strip of the ocean, which may be defined accurately enough on the map and which skilful navigators could approximately determine, but which might be violated without any practical means of detection by a belligerent commander whenever he misread, or it suited him to misread, his bearings.

Connected with the principle of neutralization is that of guaranteeing the integrity of states. Several such guarantees have been given in quite recent times. In November 1907 a treaty was concluded between France, Germany, Great Britain and Russia on the one part and Norway on the other, for the maintainance of the integrity of Norway. This treaty differed from the older one of 1855 in which France and Great Britain guaranteed the integrity of Norway and Sweden, in the fact that whereas the older treaty was for the protection of these two states against Russia, the new treaty is intended, if it is to serve at all as a protection against invasion, to protect Norway against Sweden.

Another such guarantee of a vaguer character is that which the North Sea powers recently entered into for the maintenance of the *status quo* of their respective North Sea territories; and the similar one entered into by the Mediterranean powers for the same objects in the Mediterranean. Lastly in the same order of ideas Austria-Hungary and Russia are said to have concluded an arrangement between them for the maintenance of the *status quo* in the Balkans.

The future has no doubt still other extensions of the principle of neutralization in store for us. Not the least interesting of existing possibilities is the limitation of the area of visit and search in time of war itself, as a restriction of belligerent right. It seems contrary to common sense that neutral ships should be exposed to being detained, taken out of their course, and overhauled on mere suspicion of carrying contraband, when they are so far from the seat of war that there can be no presumption as to their destination. Neutrals have a right to carry on their ordinary business unmolested in so far as they do nothing to assist either belligerent. When they are beyond a certain distance from the seat of war it seems reasonable that the presumption that they are merely carrying on their legitimate business should be considered absolute. Such a limitation of the area of hostilities is not only feasible, but it was actually put in practice by the British government during the Boer War.[3]

In the course of the Russo-Japanese War the question came up again, being raised this time by Great Britain. Lord Lansdowne called the attention of the Russian foreign office to the extreme inconvenience to neutral commerce of the Russian search for contraband not only in the proximity of the scene of war, but over all the world, and especially at places at which neutral commerce could be most effectually intercepted. H.M. government had become aware that a large addition was likely to be made to the number of Russian cruisers employed in this manner, and they had, therefore, to contemplate the possibility that such vessels would shortly be found patrolling the narrow seas which lie on the route from Great Britain to Japan in such a manner as to render it virtually impossible for any neutral vessel to escape their attention. The effect of such interference with neutral trade, he said, would be disastrous to legitimate commerce passing from a British port in the United Kingdom to a British port in the Far East. The British government had no desire to place obstacles in the way of a belligerent desiring to take reasonable precautions in order to prevent the enemy from receiving supplies, but they insisted that the right of taking such precautions did not imply a "consequential right to intercept at any distance from the scene of operations and without proof that the supplies in question were really destined for use of the enemy's forces, any articles which that belligerent might determine to regard as contraband of war."

[1] *Memoir of Massachusetts State Board of Trade* (Feb. 13, 1905).

[2] This was merely reviving an idea which had come and gone many times before. See Barclay, *Problems of International Practice and Diplomacy* (1907).

[3] In January 1900 it was reported that the British government had issued instructions to British naval commanders not to stop or search German merchant vessels at any places not in the vicinity of the seat of war. There is no proper statement of the British position on this subject, the only official information having been given by the German chancellor in a speech to the Reichstag. According to this information, the area was ultimately limited as north of Aden, and afterwards it was agreed that the immunity from search should be extended to all places beyond a distance from the seat of war equal to the distance from it of Aden. This was substantially correct, though the telegrams sent by the Admiralty can hardly be said to have fixed any precise area. As a fact, the commanders-in-chief on the East Indies and Cape of Good Hope stations were instructed that in consequence of the great practical difficulty of proving—*at ports so remote from the scene of war operations as Aden and Perim*—the real destination of contraband of war carried by vessels visiting those parts, directions were to be given to the officers concerned to cease to search such vessels, and to merely report to the commander-in-chief at the Cape the names of ships suspected of carrying contraband, and the date of clearance.

The position thus assumed is not clear. On the one hand the British claim did not, it is seen, go the length of the restriction Great Britain consented to place on her own right of search during the Boer War, seeming to apply only to the case of ships carrying conditional contraband. On the other, the complaint is based on the "interference" with neutral trade, which means the stoppage and search of vessels to ascertain whether they have contraband of any kind on board or not.

It must not be forgotten in this connexion that restriction of the rights of the belligerent necessarily entails extension of the duties of the neutral. The belligerent has an unquestioned right to "interfere" with all neutral vessels navigating in the direction of the seat of war, for the purpose of ascertaining whether they are carrying any kind of contraband or not. Under the Declaration of London of the 26th of February 1909 it is provided under arts. 32 and 35 that a ship's papers are conclusive proof as to the voyage on which she is engaged unless she is clearly out of the course indicated by her papers and is unable to give adequate reasons to justify her deviation. Thus the interference, if the declaration is ratified, will be confined to an examination of the ship's papers where the ship is not bound for a belligerent port (cf. art. 30 of the same convention).

Standing Peace Agreements.—Foremost among standing peace agreements are, of course, the International Hague Conventions relating directly to peace, agreements which have not only created a special peace jurisdiction for the settlement of international difficulties by judicial methods but also a written law to apply within the scope of this jurisdiction.

Alongside the Hague Peace Conventions and more or less connected with them are standing treaties of arbitration which have been entered into by different nations for terms of years separately. The first of what may be called a new series was that between Great Britain and France. It has now been followed by over a hundred others forming a network of international relationships which shows that, at any rate, the wish for peace is universal among mankind.[1]

There are, however, a large number of conventions which, although not concluded with the direct object of assuring peace where difficulties have arisen, tend in a very practical manner to contract the area of possible difficulties. These are conventions for the regulation of intercourse between the subjects and citizens of different states. Such conventions obviously remove occasions for friction and are therefore among the most effective agencies contributing to the preservation of peace among civilized peoples. In most cases such conventions have created international unions of states for all matters which lend themselves to international co-operation. The first in order of date was the postal union. The system it inaugurated has now extended its scope to telegraphs, copyright, industrial property, railway traffic, the publication of customs tariffs, metric measures, monetary systems and agriculture. Berne, being the capital of the most central of the neutral European states, is the administrative centre of most of these unions. Customs tariffs and the monetary unions, however, are centralized at Brussels,

[1] The following list of standing arbitration treaties concluded after the signing of the Anglo-French treaty of October 14th, 1903, is as complete as possible down to June 1910:—

Argentina-Brazil, September 7, 1905.
,, Portugal, August 27, 1909.
Austria-Hungary Switzerland, December 3, 1904.
Belgium-Denmark, April 26, 1905.
,, Greece, May 2, 1905.
,, Norway and Sweden, November 30, 1904.
,, Rumania, May 27, 1905.
,, Russia, October 30, 1904.
,, Spain, January 23, 1905.
,, Switzerland, November 15, 1904.
Brazil-Portugal, March 25, 1909.
,, Spain, April 8, 1909.
,, Mexico, April 11, 1909.
,, Honduras, April 26, 1909.
,, Venezuela, April 30, 1909.
,, Panama, May 1, 1909.
,, Ecuador, May 13, 1909.
,, Costa Rica, May 18, 1909.
,, Cuba, June 19, 1909.
,, Bolivia, June 25, 1909.
,, Nicaragua, June 28, 1909.
,, Norway, July 13, 1909.
,, China, August 3, 1909.
,, Salvador, September 3, 1909.
,, Peru, December 7, 1909.
,, Sweden, December 14, 1909.
Colombia-Peru, September 12, 1905.
,, France, December 16, 1908.
Denmark-France, September 15, 1905.
,, Italy, December 16, 1905.
,, Netherlands, February 12, 1904.
,, Russia, March 1, 1905.
,, Spain, December 1, 1905.
,, Norway, October 8, 1908.
France-Italy, December 26, 1903.
,, Netherlands, April 6, 1904.
,, Norway and Sweden, July 9, 1904.
,, Spain, February 26, 1904.
France-Sweden and Norway, July 9, 1904.
,, Switzerland, December 14, 1904.
,, Brazil, April 7, 1909.
Great Britain-France, October 14, 1903.
,, ,, Germany, July 12, 1904.
,, ,, Italy, February 1, 1907.
,, ,, Austria-Hungary, January 11, 1905.
,, ,, Netherlands, February 15, 1905.
,, ,, Colombia, December 30, 1908.
,, ,, Sweden and Norway, August 11, 1904.
,, ,, Denmark, October 25, 1904.
,, ,, Portugal, November 16, 1904.
,, ,, Spain, February 27, 1904.
,, ,, Switzerland, November 16, 1904.
,, ,, United States, April 4, 1908.
,, ,, Brazil, June 18, 1909.
Honduras-Spain, May 13, 1905.
Italy-Argentine, September 18, 1907.
,, Mexico, October 1, 1907.
,, Peru, April 18, 1907.
,, Portugal, May 11, 1905.
,, Switzerland, November 23, 1904.
,, Netherlands, November 21, 1909.
Netherlands-Portugal, October 26, 1905.
Norway-Sweden, October 26, 1905.
Norway and Sweden-Russia, December 9, 1904.
,, ,, Spain, January 23, 1905.
,, ,, Switzerland, December 17, 1904.
Portugal-Spain, May 31, 1904.
,, Austria-Hungary, February 13, 1906.
,, Denmark, March 20, 1907.
,, France, June 29, 1906.
,, Italy, May 11, 1905.
,, Netherlands, October 1, 1904.
,, Norway and Sweden, May 6, 1905. (Suspended for Norway by a new one dated December 8, 1908.)
,, Spain, May 31, 1904.
,, Switzerland, August 18, 1905.
,, Nicaragua, July 17, 1909.
Russia-Norway and Sweden, November 26, 1904.
Spain Greece, December 3–16, 1909.
,, Switzerland, May 14, 1907.
United States-Spain, April 20, 1908.
,, ,, Denmark, May 18, 1908.
,, ,, Italy, March 28, 1908.
,, ,, Japan, May 5, 1908.
,, ,, Netherlands, May 2, 1908.
,, ,, Portugal, April 6, 1908.
,, ,, Sweden, May 2, 1908.
,, ,, Switzerland, February 29, 1908.
,, ,, Argentina, December 23, 1908.
,, ,, Peru, December 3, 1908.

the weights and measures union in Paris and the agricultural institute at Rome.

The general postal union was created by a convention signed at Berne in 1874. A convention for a similar union for telegraphs was signed in Paris in 1875 (revised at St Petersburg and replaced by another the same year). Both unions issue monthly bulletins and other publications giving useful information about these two services.[1]

The international bureau of weights and measures at Paris was created by a convention signed there in 1875, for the purpose of comparing and verifying weights and measures on the metric system, and preserving their identity for the contracting states.

The double-standard Latin union monetary system was founded by a convention of 1865, between Belgium, France, Italy and Switzerland. In 1868 it was joined by Greece. A single standard union exists between Sweden, Norway and Denmark under a convention of 1873.

The copyright union was created by an international convention signed in 1874. The official bureau of the union is at Berne. It issues a periodical publication called *Le Droit d'auteur* giving information respecting the laws of different states relating to published matter of all kinds.

The term "industrial property" covers patents, trade marks, merchandise marks, trade names, designs and models. The convention dealing with them signed in 1883 created a union with its central office at Berne. It, too, issues a bulletin and other publications which help to prevent misunderstandings.

The railway traffic union was formed by a convention of 1890. The central bureau at Berne issues a monthly bulletin. A subsequent convention was signed at Berne in 1886 relating to matters of technical unification.

[1] A subsidiary convention not quite falling within the scope of the above convention is the submarine telegraphs convention, which was signed in 1884. It applies outside territorial waters to all legally established submarine cables landed on the territories, colonies or possessions of one or more of the high contracting parties. Under its provisions it is a punishable offence "to break or injure a submarine cable wilfully or by culpable negligence in such manner as might interrupt or obstruct telegraphic communication either wholly or partially, such punishment being without prejudice to any civil action for damages. It also provides that:—"Vessels engaged in laying or repairing submarine cables shall conform to the regulations as to signals which have been, or may be, adopted by mutual agreement among the high contracting parties with the view of preventing collisions at sea. When a ship engaged in repairing a cable exhibits the said signals, other vessels which see them or are able to see them shall withdraw to or keep beyond a distance of one nautical mile at least from the ship in question so as not to interfere with her operations" (art. 5). "Owners of ships or vessels who can prove that they have sacrificed an anchor, a net or other fishing-gear in order to avoid injuring a submarine cable shall receive compensation from the owner of the cable," and "in order to establish a claim to such compensation a statement supported by the evidence of the crew should whenever possible be drawn up immediately after the occurrence and the master must within twenty-four hours after his return to or next putting into port make a declaration to the proper authorities" (art. 7). "The tribunals competent to take cognizance of infractions of the present convention are those of the country to which the vessel on board of which the offence was committed belongs" (art. 8). By art. 15 it is provided that the stipulations of the convention do not in any way restrict the action of belligerents. It may be remarked that the British representative at the time of signing the convention declared that his government understood that in the time of war a belligerent would be free to act in regard to submarine cables as though the convention did not exist. The act to carry into effect the above convention is the Submarine Telegraph Act 1885 (48 & 49 Vict. c. 49) which was slightly modified by 50 Vict. c. 3. Section 3 of the earlier act provides that a person who injures the cable either wilfully or by culpable negligence is "guilty of a misdemeanour and on conviction: (*a*) if he acted wilfully, shall be liable to penal servitude for a term not exceeding five years, or to imprisonment with or without hard labour for a term not exceeding two years, and to a fine either in lieu of or in addition to such penal servitude or imprisonment; and (*b*) if he acted by culpable negligence shall be liable to imprisonment for a term not exceeding three months without hard labour, and to a fine not exceeding £100 either in lieu of or in addition to such imprisonment."

See Board of Trade Correspondence on Protection of Submarine Cables, printed on the 24th of July 1882; and Parliamentary Paper C. 5011, 1800.

Under the convention creating the customs tariffs union, signed in 1890, thirty states, including Great Britain and most British colonies, are associated for the purpose of prompt publication of custom tariffs and their modifications.

The agricultural institute, created by a convention of 1905 with its seat at Rome, as the latest in date is perhaps the most interesting of the series. It shows how deep and widespread the sense of the utility of international state co-operation has become. The convention sets out the scope and objects of the institute, which a recent British official publication states has been joined by 38 states, including Great Britain and all other great powers, as follows:—

> Whilst limiting its action to international questions, it shall be the duty of the institute: (*a*) To collect, elaborate and publish, with as little delay as possible, statistical, technical, or economic information regarding the cultivation of the soil, its productions, whether animal or vegetable, the trade in agricultural products, and the prices obtained on the various markets. (*b*) To communicate to interested parties, also without delay, full information of the nature above mentioned. (*c*) To indicate the wages of rural labour. (*d*) To notify all new diseases of plants which may appear in any part of the world, indicating the districts affected, the spread of the disease, and, if possible, the efficacious means of resistance. (*e*) To consider questions relating to agricultural co-operation, insurance and credit, in all their forms, collecting and publishing information which may be useful in the various countries for the organization of undertakings relating to agricultural co-operation, insurance and credit. (*f*) To present, if expedient, to the governments, for their approval, measures for the protection of the common interests of agriculturists and for the improvement of their condition, after having previously taken every means of obtaining the necessary information, *e.g.* resolutions passed by international congresses or other congresses relating to agriculture or to sciences applied to agriculture, agricultural societies, academies, learned societies, &c.
>
> All questions relating to the economic interests, the legislation and administration of any particular state, must be excluded from the sphere of the institute. (Art. 9).

Lastly, there is a class of difficulties which might arise from preferential treatment of trade from different countries. To obviate them statesmen have been led to adopt the principle of the "most-favoured-nation-clause"—that is to say, a clause providing that if any reductions of tariff or other advantages are granted by either contracting state to any third state, the others shall have the benefit of it. In Europe this clause has been uniformly treated as applying to all reductions of tariff without distinction. The United States interpretation, on the other hand, distinguishes between reductions of a general character and reductions made specifically in return for reductions by some other state. The latter do not come within the operation of the clause, and a co-contracting state is only entitled to obtain extension of them to itself on granting similar concessions. In other words, concessions to any co-contracting state are only allowed gratuitously to a third co-contracting state when nothing has been given for them, the clause not covering advantages granted in return for advantages. It is to be hoped that this special view of the meaning of the clause will be met in the future, as in some recent treaties, by specifically dealing with the exceptions.[2]

The Utility of Popular Effort.—Until quite recently it had been a distinctive mark of practical wisdom to treat private efforts for the improvement of international relations or for the preservation of peace, with the patronizing tolerance courteous people of the world extend to half-crazy idealists. Since the opening of the century, an immense change has taken place in the attitude of the leaders of popular opinion towards the advocacy of peace. This new attitude has been contemporary with the greater interest displayed by the mercantile classes of England and the United States in the improvement of their political relations with their neighbours. It may be said to have begun with the visit of the Association of British Chambers of Commerce to Paris in 1900, at a time when France was still smarting from the humiliation of the Fashoda affair, and the Boer War was exciting hostile demonstrations against Great Britain throughout the continent of Europe. That some four hundred British manufacturers

[2] See Barclay, *Problems of International Practice and Diplomacy* (1907), p. 137 seq.

and merchants, representing about eighty chambers of commerce of the United Kingdom, should have swept aside all political objections and have boldly trusted to the efficacy of friendly advances as between man and man, appealed to the French people. It seems to have been the first great popular effort ever made deliberately by a representative body of the middle class of a nation for the promotion of international friendship without the aid of diplomacy and without official assistance or even countenance of any kind.

Otherwise, private agencies of a standing character which contribute towards the promotion of peace may be divided into four classes, viz. (1) those which, without having peace for their direct object, promote friendship among men of different races and nationalities; (2) those which directly address themselves to the promoting of friendship and goodwill among peoples; (3) those which regarding peace as the immediate object of their efforts, endeavour to educate democracy in this sense; (4) those which endeavour to remove the causes of international friction by the codification of international law and the promotion of the international regulation of common interests. Lastly, there are two agencies which cannot be classed among the foregoing; one is the International Parliamentary Union and the other the Nobel Prize Committee.

1. Agencies which are indirectly making for peace are of many kinds. Science and medicine now bring men of all nations together in periodical congresses. Technology, electricity, mining, railways, navigation and many other subjects are now dealt with in international congresses. International exhibitions are always used as an occasion for holding many such meetings.

2. One of the most notable efforts directed to the deliberate cementing of friendship has been the interchange of official visits by municipal bodies. In the course of the Anglo-French agitation which culminated in March 1903 with the visit of King Edward to Paris, the French municipal councils passed many resolutions in favour of the *entente*. After the conclusion of the Anglo-French standing treaty of arbitration (Oct. 14, 1903) and the arrangements for the general settlement of outstanding difficulties with France (April 8, 1904), the municipal bodies in France were prepared to go a step farther, and in 1906 the Municipal Council of Paris was invited by the London County Council to pay an official visit to England. This visit was followed by a return visit to Paris and a similar exchange of visits between the London City Corporation and the Paris Municipal Council, exchange visits of the city corporations of Manchester, Glasgow and Edinburgh and Lyons, and a visit of the Manchester Corporation to Düsseldorf, Barmen and Cologne. A society, numbering many thousands of working men among its members, which has set itself the more special task of promoting the interchange of visits between working men of different nations, is called the "International Brotherhood Alliance," or, after the initials of its motto, *Fraternitas inter gentes*, the F.I.G. Another agency, called the "American Association for International Conciliation," seeks by the publication of essays on the different aspects of international friendship to promote the same cause.

3. The "peace societies," which are scattered over the whole world, number several hundreds.[1] Their first International Congress was held in London at the suggestion of Joseph Sturge in 1843. In 1848 a second congress was held at Brussels. The third in 1849 took place in Paris, and was presided over by Victor Hugo. Other congresses were held at Frankfurt, again in London, and in 1853 at Manchester, where Richard Cobden and John Bright took part in the discussions. Then followed an interval of wars during which the Pacifists were unable to raise their voices. At length in 1878 a congress was held at the Paris International Exhibition of that year, but it was not till the next Paris International Exhibition of 1889 that these international peace congresses became periodical. Since then numerous congresses have been held, the seventeenth having sat in London in 1908, and the eighteenth at Stockholm in 1910. These congresses have been supplemented by national congresses in both Great Britain and France. Such congresses are doing admirable work in the popularizing of thought upon the numerous questions which are discussed at the meetings, such as compulsory arbitration, the restriction of armaments, private property at sea in time of war, the position of subject races, airships in war, &c.[2]

4. First among the bodies which try to remove the causes of international friction is the Institute of International Law. This is a body of international lawyers, consisting of sixty members and sixty associates recruited by election—the members from those who "have rendered services to international law in the domain of theory or practice," and associates from those "whose knowledge may be useful to the institute." It was formed in 1873, chiefly through the efforts of M. Rolin-Jaequemyns. The official language of the institute is French, and its annual meetings are held wherever the members at the previous meeting decide to assemble. Its mode of operation is to work out the matters it deals with during the intervals between the sessions, in permanent commissions, among which the whole domain of international law is divided up. The commissions, under the direction of their *rapporteurs* or conveners, prepare reports and proposals, which are printed and distributed among the members some time before the plenary sittings at which they are to be discussed. If the members are not agreed, the subject is adjourned to another session, and still another, until they do agree. Thus the resolutions of the Institute have the authority attaching to a mature expression of the views of the leading international jurists of Europe. Another body having a more or less similar purpose is the International Law Association, which was founded in 1873 as the "Association for the Reform and Codification of the Law of Nations," with practically the same objects as those which led to the constitution of the Institute of International Law. It also meets in different countries, but it differs from the Institute in the number of its members being unlimited and in all respectable persons being eligible for membership. A report is published after each meeting. There are now numerous volumes of such reports, many of them containing most valuable materials for international jurists. In 1895 the name was changed to International Law Association.

A new society was recently (1906) formed in America called the American Society of International Law, "to foster the study of international law and promote the establishment of international relations on the basis of law and justice." "Membership in the society is not restricted to lawyers, and any man of good moral character interested in the objects of the society may be admitted to membership." The publications of this society have already taken an important place among the literature of international law.

Still more recently yet another society came into being in Switzerland with objects which seem to be similar to those of the Institute of International Law.

The Inter-Parliamentary Union, which dates back to 1887, owes its origin to the initiative of the late Sir W. R. Cremer. It is composed of groups of the different parliaments of the world, who meet periodically to "bring about the acceptance in their respective countries, by votes in parliament and by means of arbitration treaties, of the principle that differences between nations should be submitted to arbitration and to consider other questions of international importance."[3] The sixteenth conference was held at Brussels in August–September, 1910.

[1] See *Annuaire du mouvement pacifiste pour l'année 1910*, published by the Bureau International de la Paix, at Bern.

[2] At the third congress of the new series, held at Rome in 1891, was created the Bureau International de la Paix. This most useful institution, which has its office at Bern, serves as a means of bringing and keeping together all the known peace societies. Its *Correspondance bimensuelle* and *Annuaire du mouvement pacifiste* are well known, and its obliging hon. secretary, Dr A. Gobat, is always ready to supply information from the now considerable archives of the Bureau. In this connexion we may mention that the secretary of the London Peace Society, Dr Evans Darby, has edited an exhaustive collection of materials called *International Tribunals*. His statements every two years on the progress of arbitration at the International Law Association meetings also form an excellent source of materials for reference.

[3] Art. 1 of Statutes revised Sept. 1908.

The Nobel Committee owes its existence to the will of the late Alfred B. Nobel (1833–1896), the inventor of dynamite, who left a considerable fortune for the encouragement of men who work for the benefit of humanity. The interest of this money was to be divided into five equal parts, to be distributed every year as rewards to the persons who had deserved best of mankind in five departments of human activity. The clauses of the will governing the distribution of these prizes are as follows:—

"The entire sum shall be divided into five equal parts, one to go to the man who shall have made the most important discovery or invention in the domain of physical science; another to the man who shall have made the most important discovery or introduced the greatest improvement in chemistry; the third to the author of the most important discovery in the domain of physiology or medicine; the fourth to the man who shall have produced the most remarkable work of an idealistic nature; and, finally, the fifth to the man who shall have done the most or best work for the fraternity of nations, the suppression or reduction of standing armies, and the formation and propagation of peace congresses. The prizes shall be awarded as follows: For physical science and chemistry, by the Swedish Academy of Sciences; for physiological or medical work, by the Caroline Institution at Stockholm; for literature, by the Stockholm Academy, and for peace work, by a committee of five members elected by the Norwegian Storthing. It is my express desire that, in awarding the prizes, no account shall be taken of nationality, in order that the prize may fall to the lot of the most deserving, whether he be Scandinavian or not."

Peace v. War.—Peace is the ultimate object of all statecraft—peace in the development of the domestic activities of the nation administered, and peace in the relations of states with one another. For the purpose of ensuring peace an expensive diplomacy is maintained by all states, and to perpetuate it treaties are entered into by states with one another. Even war has no other avowed purpose than that of placing specific international relations on a definite footing. Ultimate peace is uniformly proclaimed by every dictator at home, by every conqueror abroad, as the goal to which he is directing his efforts. And yet dissentient voices are sometimes heard defending war as if it were an end in itself. Without going back to the well-known reply of Count Moltke to Professor Bluntschli respecting the *Manual of the Laws of War* drawn up by the Institute of International Law in 1880,[1] we need only quote that highly up-to-date philosopher, Nietsche: "It is mere illusion and pretty sentiment," he observes, "to expect much (even anything at all) from mankind if it forgets how to make war. As yet no means are known which call so much into action as a great war, that rough energy born of the camp, that deep impersonality born of hatred, that conscience born of murder and cold-bloodedness, that fervour born of effort in the annihilation of the enemy, that proud indifference to loss, to one's own existence, to that of one's fellows, to that earthquake-like soul-shaking which a people needs when it is losing its vitality."[2]

It is pleasant to contrast this neurotic joy of one onlooker with the matter-of-fact reflexions of another, the late W. E. H. Lecky. "War" he says "is not, and never can be, a mere passionless discharge of a painful duty. It is in its essence, and it is a main condition of its success, to kindle into fierce exercise among great masses of men the destructive and combative passions—passions as fierce and as malevolent as that with which the hound hunts the fox to its death or the tiger springs upon its prey. Destruction is one of its chief ends. Deception is one of its chief means, and one of the great arts of skilful generalship is to deceive in order to destroy. Whatever other elements may mingle with and dignify war, this at least is never absent; and however reluctantly men may enter into war, however conscientiously they may endeavour to avoid it, they must know that when the scene of carnage has once opened, these things must be not only accepted and condoned, but stimulated, encouraged and applauded. It would be difficult to conceive a disposition more remote from the morals of ordinary life, not to speak of Christian ideals, than that with which the soldiers most animated with the fire and passion that lead to victory rush forward to bayonet the foe.... It is allowable to deceive an enemy by fabricated despatches purporting to come from his own side; by tampering with telegraph messages; by spreading false intelligence in newspapers; by sending pretended spies and deserters to give him untrue reports of the numbers or movements of the troops; by employing false signals to lure him into an ambuscade. On the use of the flag and uniform of an enemy for purposes of deception there has been some controversy, but it is supported by high military authority. . . . Hardly any one will be so confident of the virtue of his rulers as to believe that every war which his country wages in every part of its dominions with uncivilized as well as civilized populations, is just and necessary, and it is certainly prima facie not in accordance with an ideal morality that men should bind themselves absolutely for life or for a term of years to kill without question, at the command of their superiors, those who have personally done them no wrong."[3]

Surely with all the existing activity in the removal of causes of war, in the reduction to precise expression of the rules of law governing the relations of states with one another, in the creation of international judicatures for the application of these rules, in the concluding of treaties specifically framed to facilitate the pacific settlement of difficulties diplomacy may have failed to adjust, in the promotion of democratic civilian armies with everything to lose by war, and all the other agencies which have been described above, the hope seems warranted that, in no distant future, life among nations will become still more closely assimilated to life among citizens of the same nation, with legislation, administration, reform all tending to the one great object of law, order and peace among men. (T. Ba.)

PEACE, BREACH OF THE. Theoretically all criminal offences cognisable by English law involve a breach of the king's peace, and all indictments whether for offences against the common law or by statute conclude "against the peace of our lord the king, his crown and dignity." Historically this phrase, now legally superfluous, represents the last trace of the process by which the royal courts assumed jurisdiction over all offences, and gradually extruded the jurisdiction of the sheriff and of lords of manors and franchises, making crime a matter of national concern as distinguished from civil wrongs or infractions of the rights of local magnates, or of the rights of the tribal chiefs of the Teutonic conquerors of Britain. The peace of the king was sworn on his accession or full recognition, and the jurisdiction of his courts to punish all violations of that peace was gradually asserted. The completion of this process is marked by the institution of the office of justice of the peace.

In modern times the expression "breach of the peace" is usually limited to offences involving actual tumult, disturbance or disorder. As regards such offences, although they do not fall into the class of grave crimes described as felonies, officers of police and even private persons have larger powers and duties, as to immediate arrest without waiting for judicial warrant, than they possess as to other minor offences (see Arrest). Justices of the peace have under early statutes and the commission of the peace power to take sureties of the peace from persons who are threatening to commit a breach of the peace, and it is within the power of any court on conviction of any misdemeanour and of many felonies to require the offender to enter into a recognizance (*q.v.*) to keep the peace.

PEACE CONFERENCES, the official title of the two international conferences held at the Hague in 1899 and 1907. Both were organized at the instance of the emperor Nicholas II. of Russia. The chief object of the first conference, as set out in the note of Count Mouraviev, the Russian minister of foreign affairs (Jan. 11, 1899), was to arrive at an "understanding not to increase for a fixed period the present effectives of the armed military and naval forces, and at the same time not to increase the budgets pertaining thereto; and a preliminary examination of the means by which even a reduction might be effected in future in the forces and budgets above

[1] "Perpetual peace," he said, "is a dream, and it is not even a beautiful dream. War is an element in the order of the world ordained by God . . . Without war the world would stagnate and lose itself in materialism."

[2] *Menschliches, Allzumenschliches,* No. 477.

[3] *The Map of Life,* 1902, pp. 92–97.

mentioned."[1] The conference, which was attended by representatives of 26 states, sat from the 18th of May to the 29th of July 1899.

When the subject of excessive armaments came up for discussion, the objections of the German military delegate led to its abandonment. Other very important matters, however, were dealt with, and three momentous conventions were adopted, viz.—

I. A convention for the pacific settlement of international disputes.

II. A convention relating to the laws and customs of war by land.

III. A convention for the adaptation to maritime warfare of the principles of the Geneva Convention of the 22nd of August 1864.

Three declarations on the following matters were also adopted :—

a. Prohibition of the launching of projectiles and explosives from balloons or by other similar new methods.[2]

b. Prohibition of the use of projectiles the only object of which is the diffusion of asphyxiating or deleterious gases.

c. Prohibition of the use of bullets which expand or flatten easily in the human body, such as bullets with a hard envelope, of which the envelope does not entirely cover the core, or is pierced with incisions.

The conference furthermore passed the following resolutions :—

"The Conference is of opinion that the restriction of military budgets, which are at present a heavy burden on the world, is extremely desirable for the increase of the material and moral welfare of mankind."

"The Conference, taking into consideration the preliminary steps taken by the Swiss Federal Government for the revision of the Geneva Convention, expresses the wish that steps may be shortly taken for the assembling of a special Conference, having for its object the revision of that Convention."

The following *vœux* were adopted, but not unanimously :—

"1. The Conference expresses the wish that the question of the rights and duties of neutrals may be inserted in the programme of a conference in the near future.

"2. The Conference expresses the wish that the questions with regard to rifles and naval guns, as considered by it, may be studied by the Governments with the object of coming to an agreement respecting the employment of new types and calibres.

"3. The Conference expresses the wish that the Governments, taking into consideration the proposals made at the Conference, may examine the possibility of an agreement as to the limitation of armed forces by land and sea, and of war budgets.

"4. The Conference expresses the wish that the proposals which contemplate the declaration of the inviolability of private property in naval warfare may be referred to a subsequent conference for consideration.

"5. The Conference expresses the wish that the proposal to settle the question of the bombardment of ports, towns and villages by naval forces may be referred to a subsequent conference for consideration."

Great Britain signed and became a party to the three Conventions, but not to all the declarations, &c.

The Conference of 1907, which was attended by representatives of forty-four states, sat from the 15th of June to the 18th of October. Again, in spite of the resolution and *vœu* on armaments handed down from the Conference of 1899, this subject was waived, but still more important conventions than in 1899 were adopted on other matters. These were as follows :—

I. Convention for the pacific settlement of international disputes.[3]

II. Convention respecting the limitation of the employment of force for the recovery of contract debts.

III. Convention relative to the commencement of hostilities.

IV. Conventions concerning the laws and customs of war on land.[3]

V. Convention respecting the rights and duties of neutral powers and persons in war on land.

VI. Convention relative to the status of enemy merchant-ships at the outbreak of hostilities.

VII. Convention relative to the conversion of merchant-ships into war-ships.

VIII. Convention relative to the laying of automatic submarine contact mines.

IX. Convention respecting bombardment by naval forces in time of war.

X. Conventions for the adaptation of the principles of the Geneva Convention to maritime war.[4]

XI. Convention relative to certain restrictions on the exercise of the right of capture in maritime war.[4]

XII. Convention relative to the establishment of an international prize court.

XIII. Convention respecting the rights and duties of neutral powers in maritime war.

XIV. Declaration prohibiting discharge of projectiles, &c., from balloons.[5]

A draft Convention relative to the creation of a judicial arbitration court was also drawn up in connexion with the first of the four following *vœux* :—

1. The Conference calls the attention of the signatory powers to the advisability of adopting the annexed draft convention for the creation of a judicial arbitration court, and of bringing it into force as soon as an agreement has been reached respecting the selection of the judges and the constitution of the court.

2. The Conference expresses the opinion that, in case of war, the responsible authorities, civil as well as military, should make it their special duty to ensure and safeguard the maintenance of pacific relations, more especially of the commercial and industrial relations between the inhabitants of the belligerent states and neutral countries.

3. The Conference expresses the opinion that the powers should regulate, by special treaties, the position, as regards military charges, of foreigners residing within their territories.

4. The Conference expresses the opinion that the preparation of regulations relative to the laws and customs of naval war should figure in the programme of the next conference,[6] and that in any case the powers may apply, as far as possible, to war by sea the principles of the Convention relative to the laws and customs of war on land.

Finally, the Conference recommended to the powers the assembly of a Third Peace Conference, and it called their attention to the necessity of preparing the programme of this Third Conference a sufficient time in advance to ensure its deliberations being conducted with the necessary authority and expedition.

In order to attain this object the Conference considered that it "would be very desirable that, some two years before the probable date of the meeting, a preparatory committee should be charged by the governments with the task of collecting the various proposals to be submitted to the Conference, of ascertaining what subject are ripe for embodiment in an international regulation, and of preparing a programme which the governments should decide upon in sufficient time to enable it to be carefully examined by the countries interested," and that this committee should further be entrusted with the task of proposing a system of organization and procedure for the Conference itself. (T. Ba.)

PEACH, CHARLES WILLIAM (1800–1886), British naturalist and geologist, was born on the 30th of September 1800 at Wansford in Northamptonshire; his father at the time was a saddler and harness-maker, and afterwards became an innkeeper farming about 80 acres of land. He received an elementary education at Wansford and at Folkingham in Lincolnshire; and assisted for several years in the inn and farm. In 1824 he was appointed riding officer in the Revenue Coast-guard at Weybourn in Norfolk. Sea-weeds and other marine organisms now attracted his attention, and these he zealously collected. His duties during the next few years led him to remove successively to Sheringham, Hasboro (Happisburgh), Cromer and Cley, all in Norfolk. In the course of his rambles he met the Rev. James Layton, curate at Catfield, who lent him books and assisted in laying the foundations of accurate knowledge. About the year 1830 he was transferred to Charmouth in Dorset, thence to Beer and Paignton in Devon, and to Gorran Haven near Mevagissey in Cornwall. Here he continued to pursue his zoological studies

[1] At the Conference the Russian government, further developing the proposal, submitted the following details :—

"1. Establishment of an international understanding for a term of five years, stipulating non-increase of the present figures of the peace effective of the troops kept up for home use.

"2. Fixation, in case of this understanding being arrived at, and, if possible, of the figures of the peace effective of all the powers excepting colonial troops.

"3. Maintenance for a like term of five years of the amount of the military budgets at present in force."

[2] This Conference was held at Geneva in June–July 1906. The revised Convention, composed of 33 articles, is dated July 6, 1906.

[3] This is an amended edition of that of 1899.

[4] This is an amended edition of that of 1899.

[5] This was practically a re-enactment of that of 1899.

[6] This has since been done to a large extent by the Conference of London (1908–1909). See BLOCKADE; CONTRABAND; INTERNATIONAL LAW; PEACE.

and supplied many specimens to G. Johnston, who was then preparing his *History of the British Zoophytes* (1838). It was here too that he first found fossils in some of the older rocks previously regarded as unfossiliferous—the discovery of which proved the presence of Bala Beds (Ordovician or Lower Silurian) in the neighbourhood of Gorran Haven. In 1841 he read a paper before the British Association at Plymouth "On the Fossil Organic Remains found on the south-east coast of Cornwall," and in 1843 he brought before the Royal Geological Society of Cornwall an account of his discovery of fish remains in the Devonian slates near Polperro. Peach was transferred for a time to Fowey; and in 1849 to Scotland, first to Peterhead and then to Wick (1853), where he made acquaintance with Robert Dick of Thurso. He collected the old red Sandstone fishes; and during a sojourn at Durness he first found fossils in the Cambrian limestone (1854). Peach retired from the government service in 1861, and died at Edinburgh on the 28th of February 1886.

Biographical notice, with portrait, in S. Smiles's *Robert Dick, Baker, of Thurso, Geologist and Botanist* (1878).

PEACH, the name of a fruit tree which is included by Bentham and Hooker (*Genera plantarum*, i. 610) under the genus *Prunus* (*Prunus persica*); its resemblance to the plum is indeed obvious. Others have classed it with the almond as a distinct genus, *Amygdalus*; while others again have considered it sufficiently distinct to constitute a separate genus, *Persica*.

In general terms the peach may be said to be a medium-sized tree, with lanceolate, stipulate leaves, borne on long, slender, relatively unbranched shoots, and with the flowers arranged singly, or in groups of two or more, at intervals along the shoots of the previous year's growth. The flowers have a hollow tube at the base bearing at its free edge five sepals, an equal number of petals, usually concave or spoon-shaped, pink or white, and a great number of stamens. The pistil consists of a single carpel with its ovary, style, stigma and solitary ovule or twin ovules. The fruit is a drupe (fig. 1) having a thin outer skin (epicarp) enclosing the flesh of the peach (mesocarp), the inner layers of the carpel becoming woody to form the stone, while the ovule ripens into the kernel or seed. This is exactly the structure of the plum or apricot, and differs from that of the almond, which is identical in the first instance, only in the circumstance that the fleshy part of the latter eventually becomes dry and leathery and cracks open along a line called the suture.

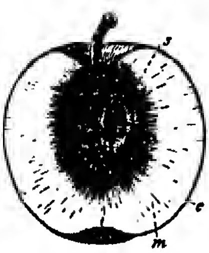

Fig. 1.—Fruit (drupe) of Peach cut lengthwise.
e, Skin or epicarp.
m, Flesh or mesocarp.
s, Stone or endocarp, within which is the seed or kernel.
(½ nat. size.)

The nectarine is a variation from the peach, mainly characterized by the circumstance that, while the skin of the ripe fruit is downy in the peach, it is shining and destitute of hairs in the nectarine. That there is no essential difference between the two is, however, shown by the facts that the seeds of the peach will produce nectarines, and vice versa, and that it is not very uncommon, though still exceptional, to see peaches and nectarines on the same branch, and fruits which combine in themselves the characteristics of both nectarines and peaches. The blossoms of the peach are formed the autumn previous to their expansion, and this fact, together with the peculiarities of their form and position, requires to be borne in mind by the gardener in his pruning and training operations. The only point of practical interest requiring mention here is the very singular fact attested by all peach-growers, that, while certain peaches are liable to the attacks of mildew, others are not. In the case of the peach this peculiarity is in some way connected with the presence of small glandular outgrowths on the stalk, or at the base of the leaf. Some peaches have globular, others reniform glands, others none at all, and these latter trees are much more subject to mildew than are those provided with glands.

The history of the peach, almond and nectarine is interesting and important as regards the question of the origin of species and the production and perpetuation of varieties. As to the origin of the peach two views are held, that of Alphonse de Candolle, who attributes all cultivated varieties to a distinct species, probably of Chinese origin, and that adopted by many naturalists, but more especially by Darwin, who looks upon the peach as a modification of the almond.

In the first place, the peach as we now know it has been nowhere recognized in the wild state. In the few instances where it is said to have been found wild the probabilities are that the tree was an escape from cultivation. Aitchison, however, gathered in the Hazārdarakht ravine in Afghanistan a form with different-shaped fruit from that of the almond, being larger and flatter. "The surface of the fruit," he observes, "resembles that of the peach in texture and colour; and the nut is quite distinct from that of the wild almond. The whole shrub resembles more what one might consider a wild form of the peach than that of the almond." It is admitted, however, by all competent botanists that the almond is wild in the hotter and drier parts of the Mediterranean and Levantine regions. Aitchison also mentions the almond as wild in some parts of Afghanistan, where it is known to the natives as "bādām," the same word that they apply to the cultivated almond. The branches of the tree are carried by the priests in religious ceremonies. It is not known as a wild plant in China or Japan. As to the nectarine, of its origin as a variation from the peach there is abundant evidence, as has already been mentioned; it is only requisite to add the very important fact that the seeds of the nectarine, even when that nectarine has been produced by bud-variation from a peach, will generally produce nectarines, or, as gardeners say, "come true." Darwin brings together the records of several cases, not only of gradations between peaches and nectarines, but also of intermediate forms between the peach and the almond. So far as we know, however, no case has yet been recorded of a peach or a nectarine producing an almond, or vice versa, although if all have had a common origin such an event might be expected. Thus the botanical evidence seems to indicate that the wild almond is the source of cultivated almonds, peaches and nectarines, and consequently that the peach was introduced from Asia Minor or Persia, whence the name *Persica* given to the peach; and Aitchison's discovery in Afghanistan of a form which reminded him of a wild peach lends additional force to this view.

On the other hand, Alphonse de Candolle, from philological and other considerations, considers the peach to be of Chinese origin. The peach has not, it is true, been found wild in China, but it has been cultivated there from time immemorial; it has entered into the literature and folk-lore of the people; and it is designated by a distinct name, "to" or "tao," a word found in the writings of Confucius five centuries before Christ, and even in other writings dating from the 10th century before the Christian era. Though now cultivated in India, and almost wild in some parts of the north-west, and, as we have seen, probably also in Afghanistan, it has no Sanskrit name; it is not mentioned in the Hebrew text of the Scriptures, nor in the earliest Greek times. Xenophon makes no mention of the peach, though the Ten Thousand must have traversed the country where, according to some, the peach is native; but Theophrastus, a hundred years later, does speak of it as a Persian fruit, and De Candolle suggests that it might have been introduced into Greece by Alexander. According to his view, the seeds of the peach, cultivated for ages in China, might have been carried by the Chinese into Kashmir, Bokhara, and Persia between the period of the Sanskrit emigration and the Graeco-Persian period. Once established, its cultivation would readily extend westward, or, on the other hand, by Cabul to north-western India, where its cultivation is not ancient. While the peach has been cultivated in China for thousands of years, the almond does not grow wild in that country and its introduction is supposed not to go back farther than the Christian era.

On the whole, greater weight is due to the evidence from botanical sources than to that derived from philology, particularly since the discovery both of the wild almond and of a form like a wild peach in Afghanistan. It may, however, well be that both peach and almond are derived from some pre-existing and now extinct form whose descendants have spread over the whole geographic area mentioned; but this is a mere speculation, though indirect evidence in its support might be obtained from the nectarine, of which no mention is made in ancient literature, and which, as we have seen, originates from the peach and reproduces itself by seed, thus offering the characteristics of a species in the act of developing itself.

The treatment in horticulture of the peach and nectarine is the same in every respect. To perpetuate and multiply the choicer varieties, peaches and nectarines are budded upon plum or almond stocks. For dry situations almond stocks are preferable, but they are not long-lived, while for damp or clayey loams it is better to use certain kinds of plums. Double-working is sometimes beneficial; thus an almond budded on a plum stock may be rebudded with a tender peach, greatly to the advantage of the latter. The peach border should be composed of turfy mellow

loam, such as is suitable for the vine and the fig; this should be used in as rough a state as possible, or not broken small and fine. The bottom should slope towards the outer edge, where a drain should be cut, with an outlet, and on this sloping bottom should be laid a thickness of from 9 in. to 12 in. of rough materials, such as broken bricks or mortar rubbish, over which should be placed a layer of rough turf with the grassy side downwards, and then the good loamy soil to form the border, which should have a depth of about 2 ft. 6 in. The peach-tree is most productive when the roots are kept near the surface, and the borders, which should be from 8 ft. to 12 ft. wide, should not be cropped heavily with culinary vegetables, as deep trenching is very injurious. Sickly and unfruitful trees may often be revived by bringing up their roots within 5 or 6 in. of the surface. It is questionable whether it is not better, in cold soils and bleak situations, to abandon outdoor peach culture, and to cover the walls with a casing of glass, so that the trees may be under shelter during the uncongenial spring weather.

The fruit of the peach is produced on the ripened shoots of the preceding year. If these be too luxuriant, they yield nothing but leaves; and if too weak, they are incapable of developing flower buds. To furnish young shoots in sufficient abundance, and of requisite strength, is the great object of peach training and pruning. Trees of slender-growing, twiggy habit naturally fall most readily into the fan form of training, and accordingly this has generally been adopted in the culture of peaches and nectarines (fig. 2). The young tree is, in many cases, procured when it has been trained for two or three years in the nursery; but it is generally better to begin with a maiden plant—that is, a plant of the first year after it has been budded. It is then in ordinary practice headed down to five or six buds, and in the following summer from two to four shoots, according to the vigour of the plant, are trained in, the laterals from which, if any, are thinned out and nailed to the wall. If there are four branches, the two central ones are shortened back at the subsequent winter pruning so as to produce others, the two lower ones being laid in nearly at full length. In the following season additional shoots are sent forth; and the process is repeated till eight or ten principal limbs or mother branches are obtained, forming, as it were, the frame-work of the future tree. The branches may be depressed or elevated, so as to check or encourage them, as occasion may arise; and it is highly advantageous to keep them thin, without their becoming in any part deficient of young shoots. Sometimes a more rapid mode of formation is now adopted, the main shoots being from the first laid in nearly at full length, instead of being shortened. The pruning for fruit consists in shortening back the laterals which had been nailed in at the disbudding, or summer pruning, their length depending on their individual vigour and the luxuriance of the tree. In well-developed shoots the buds are generally double, or rather triple, a wood bud growing between two fruit buds; the shoot must be cut back to one of these, or else to a wood bud alone, so that a young shoot may be produced to draw up the sap beyond the fruit, this being generally desirable to secure its proper swelling. The point of this leading shoot is subsequently pinched off, that it may not draw away too much of the sap. If the fruit sets too abundantly, it must be thinned, first when as large as peas, reducing the clusters, and then when as large as nuts to distribute the crop equally; the extent of the thinning must depend on the vigour of the tree, but one or two fruits ultimately left to each square foot of wall is a full average crop. The final thinning should take place after stoning.

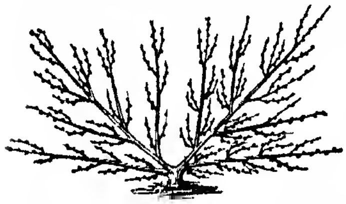

FIG. 2.—Montreuil Fan Training.

The best-placed healthy young shoot produced from the wood buds at the base of the bearing branch is to be carefully preserved and in due time nailed to the wall. In the following winter this will take the place of the branch which has just borne, and which is to be cut out. If there be no young shoot below, and the bearing branch is short, the shoot at the point of the latter may sometimes be preserved as a fruit bearer, though if the bearing branch be long it is better to cut it back for young wood. It is the neglect of this which constitutes the principal fault in carrying out the English fan system, as it is usually practised. Several times during summer the trees ought to be regularly examined, and the young shoots respectively topped or thinned out; those that remain are to be nailed to the wall, or braced in with pieces of slender twigs, and the trees ought occasionally to be washed with the garden engine or thoroughly syringed, especially during very hot summers. After gathering the fruit all the wood not needed for extending the tree or for fruit bearing next season should be cut out so as to give the shoots left full exposure to air and light.

The Montreuil form of training is represented by fig. 2. The principal feature is the suppression of the direct channel of the sap, and the substitution of four, or more commonly two, mother branches, so laid to the wall that the central angle contains about 90°.* The other branches are all treated as subordinate members. This form is open to the objection that, if the under branch should die, the upper one cannot be brought down into its place.

The form à la Dumoutier (fig. 3), so called from its inventor, is merely a refinement on the Montreuil method. The formation

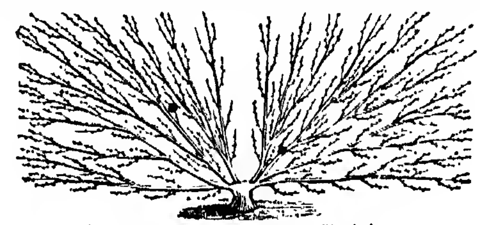

FIG. 3.—Dumoutier's Fan Training.

of the tree begins with the inferior limbs and proceeds towards the centre, the branches being lowered from time to time as the tree acquires strength. What is most worthy of notice in this method is the management of the subordinates in the pruning for fruit. When a shoot promises blossom, it is generally at some distance from the point of insertion into the old wood, and the intermediate space is covered with wood buds. All the latter, therefore, which are between the old wood *a* and the blossoms *c* in fig. 4, except the lowest *b*, are carefully removed by rubbing them off with the finger. This never fails to produce a shoot *d*, the growth of which is favoured by destroying the useless spray *e* above the blossoms, and pinching off the points of those which are necessary to perfect the fruit. A replacing shoot is thus obtained, to which the whole is invariably shortened at the end of the year.

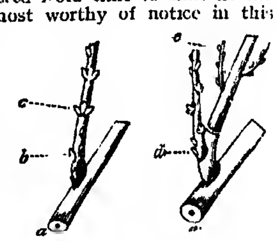

FIG. 4.—Pruning à la Dumoutier.

Seymour's form (fig. 5) approaches more nearly to the French method than any other practised in England; but the direct channel

FIG. 5.—Seymour's Fan Training.

of the sap is not suppressed, and this results in the production of branches of unequal vigour, which is very undesirable.

For cold and late situations, Thomas Andrew Knight recommended the encouragement of spurs on the young wood, as such spurs, when close to the wall, generate the best organized and most vigorous blossoms, and generally ensure a crop of fruit. They may be produced, by taking care, during the summer pruning or disbudding, to preserve a number of the little shoots emitted by the yearly wood, only pinching off the minute succulent points. On the spurs thus formed blossom buds will be developed early in the following season. This practice is well adapted to cold situations. Peach-trees require protection, especially at the period of blossoming, particularly in the north of England and in Scotland. Canvas or bunting screens are most effectual. By applying these early in the season, great benefit may be derived from retarding the blossom till the frosty nights of spring have passed. Wooden and glass copings are also very useful in warding off frosts. Care must be taken that the roots always have a sufficient supply of moisture and that the soil is moist wherever the roots run.

Forcing.—The pruning and training of the trees in the peach house do not differ materially from the methods practised out of doors. It may also be stated here that when occasion arises peach-trees well furnished with buds may be transplanted and forced immediately without risking the crop of fruit, a matter of some importance when, as sometimes happens, a tree may accidentally fail. In the forcing of peaches fire heat is commonly applied about December or January; but it may, where there is a demand, begin a month sooner. The trees must be got to start growth very

and supplied many specimens to G. Johnston, who was then preparing his *History of the British Zoophytes* (1838). It was here too that he first found fossils in some of the older rocks previously regarded as unfossiliferous—the discovery of which proved the presence of Bala Beds (Ordovician or Lower Silurian) in the neighbourhood of Gorran Haven. In 1841 he read a paper before the British Association at Plymouth "On the Fossil Organic Remains found on the south-east coast of Cornwall," and in 1843 he brought before the Royal Geological Society of Cornwall an account of his discovery of fish remains in the Devonian slates near Polperro. Peach was transferred for a time to Fowey; and in 1849 to Scotland, first to Peterhead and then to Wick (1853), where he made acquaintance with Robert Dick of Thurso. He collected the old red Sandstone fishes; and during a sojourn at Durness he first found fossils in the Cambrian limestone (1854). Peach retired from the government service in 1861, and died at Edinburgh on the 28th of February 1886.

Biographical notice, with portrait, in S. Smiles's *Robert Dick, Baker, of Thurso, Geologist and Botanist* (1878).

PEACH, the name of a fruit tree which is included by Bentham and Hooker (*Genera plantarum*, i. 610) under the genus *Prunus* (*Prunus persica*); its resemblance to the plum is indeed obvious. Others have classed it with the almond as a distinct genus, *Amygdalus*; while others again have considered it sufficiently distinct to constitute a separate genus, *Persica*.

In general terms the peach may be said to be a medium-sized tree, with lanceolate, stipulate leaves, borne on long, slender, relatively unbranched shoots, and with the flowers arranged singly, or in groups of two or more, at intervals along the shoots of the previous year's growth. The flowers have a hollow tube at the base bearing at its free edge five sepals, an equal number of petals, usually concave or spoon-shaped, pink or white, and a great number of stamens. The pistil consists of a single carpel with its ovary, style, stigma and solitary ovule or twin ovules. The fruit is a drupe (fig. 1) having a thin outer skin (epicarp) enclosing the flesh of the peach (mesocarp), the inner layers of the carpel becoming woody to form the stone, while the ovule ripens into the kernel or seed. This is exactly the structure of the plum or apricot, and differs from that of the almond, which is identical in the first instance, only in the circumstance that the fleshy part of the latter eventually becomes dry and leathery and cracks open along a line called the suture.

(⅔ nat. size.)

The nectarine is a variation from the peach, mainly characterized by the circumstance that, while the skin of the ripe fruit is downy in the peach, it is shining and destitute of hairs in the nectarine. That there is no essential difference between the two is, however, shown by the facts that the seeds of the peach will produce nectarines, and vice versa, and that it is not very uncommon, though still exceptional, to see peaches and nectarines on the same branch, and fruits which combine in themselves the characteristics of both nectarines and peaches. The blossoms of the peach are formed the autumn previous to their expansion, and this fact, together with the peculiarities of their form and position, requires to be borne in mind by the gardener in his pruning and training operations. The only point of practical interest requiring mention here is the very singular fact attested by all peach-growers, that, while certain peaches are liable to the attacks of mildew, others are not. In the case of the peach this peculiarity is in some way connected with the presence of small glandular outgrowths on the stalk, or at the base of the leaf. Some peaches have globular, others reniform glands, others none at all, and these latter trees are much more subject to mildew than are those provided with glands.

The history of the peach, almond and nectarine is interesting and important as regards the question of the origin of species and the production and perpetuation of varieties. As to the origin of the peach two views are held, that of Alphonse de Candolle, who attributes all cultivated varieties to a distinct species, probably of Chinese origin, and that adopted by many naturalists, but more especially by Darwin, who looks upon the peach as a modification of the almond.

In the first place, the peach as we now know it has been nowhere recognized in the wild state. In the few instances where it is said to have been found wild the probabilities are that the tree was an escape from cultivation. Aitchison, however, gathered in the Hazārdarakht ravine in Afghanistan a form with different-shaped fruit from that of the almond, being larger and flatter. "The surface of the fruit," he observes, "resembles that of the peach in texture and colour; and the nut is quite distinct from that of the wild almond. The whole shrub resembles more what one might consider a wild form of the peach than that of the almond." It is admitted, however, by all competent botanists that the almond is wild in the hotter and drier parts of the Mediterranean and Levantine regions. Aitchison also mentions the almond as wild in some parts of Afghanistan, where it is known to the natives as "bĕdām," the same word that they apply to the cultivated almond. The branches of the tree are carried by the priests in religious ceremonies. It is not known as a wild plant in China or Japan. As to the nectarine, of its origin as a variation from the peach there is abundant evidence, as has already been mentioned; it is only requisite to add the very important fact that the seeds of the nectarine, even when that nectarine has been produced by bud-variation from a peach, will generally produce nectarines, or, as gardeners say, "come true." Darwin brings together the records of several cases, not only of gradations between peaches and nectarines, but also of intermediate forms between the peach and the almond. So far as we know, however, no case has yet been recorded of a peach or a nectarine producing an almond, or vice versa, although if all have had a common origin such an event might be expected. Thus the botanical evidence seems to indicate that the wild almond is the source of cultivated almonds, peaches and nectarines, and consequently that the peach was introduced from Asia Minor or Persia, whence the name *Persica* given to the peach; and Aitchison's discovery in Afghanistan of a form which reminded him of a wild peach lends additional force to this view.

On the other hand, Alphonse de Candolle, from philological and other considerations, considers the peach to be of Chinese origin. The peach has not, it is true, been found wild in China, but it has been cultivated there from time immemorial; it has entered into the literature and folk-lore of the people; and it is designated by a distinct name, "to" or "tao," a word found in the writings of Confucius five centuries before Christ, and even in other writings dating from the 10th century before the Christian era. Though now cultivated in India, and almost wild in some parts of the north-west, and, as we have seen, probably also in Afghanistan, it has no Sanskrit name; it is not mentioned in the Hebrew text of the Scriptures, nor in the earliest Greek times. Xenophon makes no mention of the peach, though the Ten Thousand must have traversed the country where, according to some, the peach is native; but Theophrastus, a hundred years later, does speak of it as a Persian fruit, and De Candolle suggests that it might have been introduced into Greece by Alexander. According to his view, the seeds of the peach, cultivated for ages in China, might have been carried by the Chinese into Kashmir, Bokhara, and Persia between the period of the Sanskrit emigration and the Graeco-Persian period. Once established, its cultivation would readily extend westward, or, on the other hand, by Cabul to north-western India, where its cultivation is not ancient. While the peach has been cultivated in China for thousands of years, the almond does not grow wild in that country and its introduction is supposed not to go back farther than the Christian era.

On the whole, greater weight is due to the evidence from botanical sources than to that derived from philology, particularly since the discovery both of the wild almond and of a form like a wild peach in Afghanistan. It may, however, well be that both peach and almond are derived from some pre-existing and now extinct form whose descendants have spread over the whole geographic area mentioned; but this is a mere speculation, though indirect evidence in its support might be obtained from the nectarine, of which no mention is made in ancient literature, and which, as we have seen, originates from the peach and reproduces itself by seed, thus offering the characteristics of a species in the act of developing itself.

The treatment in horticulture of the peach and nectarine is the same in every respect. To perpetuate and multiply the choicer varieties, peaches and nectarines are budded upon plum or almond stocks. For dry situations almond stocks are preferable, but they are not long-lived, while for damp or clayey loams it is better to use certain kinds of plums. Double-working is sometimes beneficial; thus an almond budded on a plum stock may be rebudded with a tender peach, greatly to the advantage of the latter. The peach border should be composed of turfy mellow

university statutes, in which he indicated the necessity for reform; and in 1850 and 1855 he was a member of the commission of inquiry relative to the university of Cambridge. In 1837 he was appointed Lowndean professor of astronomy. In 1839 he took the degree of D.D., and the same year was appointed by Lord Melbourne to the deanery of Ely. Peacock threw himself with characteristic ardour into the duties of this new position. He improved the sanitation of Ely, published in 1840 *Observations on Plans for Cathedral Reform*, and carried out extensive works of restoration in his own cathedral. He was twice prolocutor of the lower house of convocation for the province of Canterbury. He was also a prime mover in the establishment of the Cambridge Astronomical Observatory, and in the founding of the Cambridge Philosophical Society. He was a fellow of the Royal, Royal Astronomical, Geological and other scientific societies. In 1838, and again in 1843, he was one of the commissioners for standards of weights and measures; and he also furnished valuable information to the commissioners on decimal coinage. He died on the 8th of November 1858.

Peacock's original contributions to mathematical science were concerned chiefly with the philosophy of its first principles. He did good service in systematizing the operational laws of algebra, and in throwing light upon the nature and use of imaginaries. He published, first in 1830, and then in an enlarged form in 1842, a *Treatise on Algebra*, in which he applied his philosophical ideas concerning algebraical analysis to the elucidation of its elements. A second great service was the publication in the *British Association Reports* for 1833 of his "Report on the Recent Progress and Present State of certain branches of Analysis." Modern mathematicians may find on reading this brilliant summary a good many dicta which they will call in question, but, whatever its defects may be, Peacock's report remains a work of permanent value. In 1855 he published a memoir of Thomas Young, and about the same time there appeared Young's collected works in three volumes, for the first two of which Peacock was responsible.

PEACOCK, THOMAS LOVE (1785–1866), English novelist and poet, was born at Weymouth on the 18th of October 1785. He was the only son of a London glass merchant, who died soon after the child's birth. Young Peacock was educated at a private school at Englefield Green, and after a brief experience of business determined to devote himself to literature, while living with his mother (daughter of Thomas Love, a naval man) on their private means. His first books were poetical, *The Monks of St Mark* (1804), *Palmyra* (1806), *The Genius of the Thames* (1810), *The Philosophy of Melancholy* (1812)—works of no great merit. He also made several dramatic attempts, which were never acted. He served for a short time as secretary to Sir Home Popham at Flushing, and paid several visits to Wales. In 1812 he became acquainted with Shelley. In 1815 he evinced his peculiar power by writing his novel *Headlong Hall*. It was published in 1816, and *Melincourt* followed in the ensuing year. During 1817 he lived at Great Marlow, enjoying the almost daily society of Shelley, and writing *Nightmare Abbey* and *Rhododaphne*, by far the best of his long poems. In 1819 he was appointed assistant examiner at the India House. Peacock's nomination appears to have been due to the influence of his old schoolfellow Peter Auber, secretary to the East India Company, and the papers he prepared as tests of his ability were returned with the comment, "Nothing superfluous and nothing wanting." This was characteristic of the whole of his intellectual work; and equally characteristic of the man was his marriage about this time to Jane Griffith, to whom he proposed by letter, not having seen her for eight years. They had four children, only one of whom, a son, survived his father; one daughter was the first wife of George Meredith. His novel *Maid Marian* appeared in 1822, *The Misfortunes of Elphin* in 1829, and *Crotchet Castle* in 1831; and he would probably have written more but for the death in 1833 of his mother. He also contributed to the *Westminster Review* and the *Examiner*. His services to the East India Company, outside the usual official routine, were considerable. He defended it successfully against the attacks of James Silk Buckingham and the Liverpool salt interest, and made the subject of steam navigation to India peculiarly his own. He represented the company before the various parliamentary committees on this question; and in 1839 and 1840 superintended the construction of iron steamers, which not only made the voyage round the Cape successfully, but proved very useful in the Chinese War. He also drew up the instructions for the Euphrates expedition of 1835, subsequently pronounced by its commander, General F. R. Chesney, to be models of sagacity. In 1836 he succeeded James Mill as chief examiner, and in 1856 he retired upon a pension. During his later years he contributed several papers to *Fraser's Magazine*, including reminiscences of Shelley, whose executor he was. He also wrote in the same magazine his last novel, *Gryll Grange* (1860), inferior to his earlier writings in humour and vigour, but still a surprising effort for a man of his age. He died on the 23rd of January 1866 at Lower Halliford near Chertsey, where, so far as his London occupations would allow him, he had resided for more than forty years.

Peacock's position in English literature is unique. There was nothing like his type of novel before his time; though there might have been if it had occurred to Swift to invent a story as a vehicle for the dialogue of his *Polite Conversation*. Peacock speaks as well in his own person as through his puppets; and his pithy wit and sense, combined with remarkable grace and accuracy of natural description, atone for the primitive simplicity of plot and character. Of his seven fictions, *Nightmare Abbey* and *Crotchet Castle* are perhaps on the whole the best, the former displaying the most *vis comica* of situation, the latter the fullest maturity of intellectual power and the most skilful grouping of the motley crowd of "perfectibilians, deteriorationists, status-quo-ites, phrenologists, transcendentalists, political economists, theorists in all sciences, projectors in all arts, morbid visionaries, romantic enthusiasts, lovers of music, lovers of the picturesque and lovers of good dinners," who constitute the dramatis personae of the Peacockian novel. *Maid Marian* and *The Misfortunes of Elphin* are hardly less entertaining. Both contain descriptive passages of extraordinary beauty. *Melincourt* is a comparative failure, the excellent idea of an orang-outang mimicking humanity being insufficient as the sole groundwork of a novel. *Headlong Hall*, though more than foreshadowing the author's subsequent excellence, is marred by a certain bookish awkwardness characteristic of the recluse student, which reappears in *Gryll Grange* as the pedantry of an old-fashioned scholar, whose likes and dislikes have become inveterate and whose sceptical liberalism always rather inspired by hatred of cant than enthusiasm for progress, has petrified into only too earnest conservatism. The book's quaint resolute paganism, however, is very refreshing in an age eaten up with introspection; it is the kindliest of Peacock's writings, and contains the most beautiful of his poems, "Years Ago," the reminiscence of an early attachment. In general the ballads and songs interspersed through his tales are models of exact and melodious diction, and instinct with true feeling. His more ambitious poems are worth little, except *Rhododaphne*, attractive as a story and perfect as a composition, but destitute of genuine poetical inspiration. His critical and miscellaneous writings are always interesting, especially the restorations of lost classical plays in the *Horae dramaticae*, but the only one of great mark is the witty and crushing exposure in the *Westminster Review* of Thomas Moore's ignorance of the manners and belief he has ventured to portray in his *Epicurean*. Peacock resented the misrepresentation of his favourite sect, the good and ill of whose tenets were fairly represented in his own person. Somewhat sluggish and self-indulgent, incapable of enthusiasm or self-sacrifice, he yet possessed a deep undemonstrative kindliness of nature; he could not bear to see anyone near him unhappy or uncomfortable; and his sympathy, no less than his genial humour, gained him the attachment of children, dependants, and friends. In official life he was upright and conscientious; his judgment was shrewd and robust. What Shelley justly termed "the lightness, strength and chastity" of his diction secures him an honourable rank among those English writers whose claims to remembrance depend not only upon matter but upon style.

Peacock's works were collected, though not completely, and published in three volumes in 1875, at the expense of his friend and former protégé, Sir Henry Cole, with an excellent memoir by his granddaughter Mrs Clarke, and a critical essay by Lord Houghton. His prose works were collected by Richard Garnett in ten volumes (1891). Separate novels are included in "Macmillan's Illustrated Standard Novels," with introductions by Mr Saintsbury. For an interesting personal notice, see *A Poet's Sketch Book*, by R. W. Buchanan (1884). (R. G.)

PEACOCK (Lat. *Pavo*, O. Eng. *Pawe*, Du. *pauuw*, Ger. *Pfau*, Fr. *Paon*), the bird so well known from the splendid plumage of the male, and as the proverbial personification of pride. It is a native of the Indian peninsula and Ceylon, in some parts of which it is very abundant. Setting aside its importation to Palestine by Solomon (1 Kings x. 22; 2 Chron. ix. 21), its assignment in classical mythology as the favourite bird of Hera testifies to the early acquaintance the Greeks must have had with it; but, though it is mentioned by Aristophanes and other older writers, their knowledge of it was probably very slight until after the conquests of Alexander. Throughout all succeeding time, however, it has never very freely rendered itself to domestication, and, though in earlier days highly esteemed for the table,[1] it is no longer considered the delicacy it was once thought; the young of the wild birds are, however, still esteemed in the East.

Japan or "black-shouldered" Peafowls.

As in most cases of domestic animals, pied or white varieties of the ordinary peacock, *Pavo cristatus*, are not infrequently to be seen, and they are valued as curiosities. Greater interest, however, attends what is known as the Japanese or Japan peacock, a form which has received the name of *P. nigripennis*, as though it were a distinct species. In this form the cock, besides other less conspicuous differences, has all the upper wing-coverts of a deep lustrous blue instead of being mottled with brown and white, while the hen is of a more or less grizzled-white. It "breeds true"; but occasionally a presumably pure stock of birds of the usual coloration throws out one or more having the Japan plumage. It is to be observed that the male has in the coloration of the parts mentioned no little resemblance to that of the second indubitably good species, the *P. muticus* (or *P. spicifer* of some writers) of Burma and Java, though the character of the latter's crest—the feathers of which are barbed along their whole length instead of at the tip only—and its golden-green neck and breast furnish a ready means of distinction. Sir R. Heron was confident that the Japan breed had arisen in England within his memory,[2] and C. Darwin (*Animals and Plants under Domestication*, i. 290–292) was inclined to believe it only a variety; but its abrupt appearance, which rests on indisputable evidence, is most suggestive in the light that it may one day throw on the question of evolution as exhibited in the origin of "species." It should be stated that the Japan bird is not known to exist anywhere as a wild race, though apparently kept in Japan. The accompanying illustration is copied from a plate drawn by J. Wolf, given in D. G. Elliot's *Monograph of the Phasianidae*.

The peafowls belong to the group *Gallinae*, from the normal members of which they do not materially differ in structure; and, though by some systematists they are raised to the rank of a family, *Pavonidae*, most are content to regard them as a sub-family of *Phasianidae* (PHEASANT, *q.v.*). Akin to the genus *Pavo* is *Polyplectrum*, of which the males are armed with two or more spurs on each leg, and near them is generally placed the genus *Argusianus*, containing the argus-pheasants, remarkable for their wonderfully ocellated plumage, and the extraordinary length of the secondary quills of their wings, as well as of the tail-feathers. It must always be remembered that the so-called "tail" of the peacock is formed not by the rectrices or true tail-feathers, but by the singular development of the tail-coverts. (A. N.)

[1] Classical authors contain many allusions to its high appreciation at the great [illegible] banquets; and medieval bills of fare on state occasions [illegible] include it. In the days of chivalry one of the most solemn [illegible] was taken "on the peacock," which seems to have been served up garnished with its gaudy plumage.

PEAK, THE, a high table-land in the north of Derbyshire, England, included in the Pennine range of hills. The name, however, is extended, without definite limits, to cover the whole of the hilly district north of Buxton. The table-land reaches an elevation of 2088 ft. in Kinder Scout. The geological formation is millstone-grit, and the underlying beds are not domed, but cup-shaped, dipping inward from the flanks of the mass. The summit is a peaty moorland, through which masses of rock project at intervals. The name of this high plateau has from the 17th century been identified with "peak," the pointed or conical top of a mountain, but the very early references to the district and certain places in it show clearly, as the *New English Dictionary* points out, that this connexion is unwarranted. The name appears in the *Old English Chronicle* (924) as *Péaclond*, of the district governed from the castle of Peveril of the Peak (see DERBYSHIRE), and also in the name of the cavern under the hill at Castleton, *Péac's Arse*. Péac, it has been suggested, is the name of a local deity or demon, and possibly may be identified with Puck. For the etymology of "peak," point, &c., and its variants or related words, "pick" and "pike," see PIKE.

PEALE, CHARLES WILLSON (1741–1826), American portrait painter, celebrated especially for his portraits of Washington, was born in Queen Anne county, Maryland, on the 16th of April 1741. During his infancy the family removed to Chestertown, Kent county, Maryland, and after the death of his father (a country schoolmaster) in 1750 they removed to Annapolis. Here, at the age of 13, he was apprenticed to a saddler. About 1764 he began seriously to study art. He got some assistance from Gustavus Hesselius, a Swedish portrait painter then living near Annapolis, and from John Singleton Copley in Boston; and in 1767–1770 he studied under Benjamin West in London. In 1770 he opened a studio in Philadelphia, and met with immediate success. In 1772, at Mount Vernon, Peale painted a three-quarters-length study of Washington (the earliest known portrait of him), in the uniform of a colonel of Virginia militia. This canvas is now in the Lee Memorial Chapel of Washington and Lee University. He painted various other portraits of Washington; probably the best known is a full-length, which was made in 1778, and of which Peale made many copies. This portrait had been ordered by the Continental Congress, which, however, made no appropriation for it, and eventually it was bought for a private collection in Philadelphia. Peale painted two miniatures of Mrs Washington (1772 and 1777), and portraits of many of the famous men of the time, a number of which are in Independence Hall, Philadelphia. His portraits of Washington do not appeal so strongly to Americans as do those of Gilbert Stuart, but his admitted skill as a draughtsman gives to all of his work considerable historical value. Peale removed to

[2] A. Newton himself regarded this as probably incorrect.

Philadelphia in 1777, and served as a member of the committee of public safety; he aided in raising a militia company, became a lieutenant and afterwards a captain, and took part in the battles of Trenton, Princeton and Germantown. In 1779–1780 he was a member of the Pennsylvania assembly, where he voted for the abolition of slavery—he freed his own slaves whom he had brought from Maryland. In 1801 he undertook, largely at his own expense, the excavation of the skeletons of two mastodons in Ulster and Orange counties, New York, and in 1802 he established at Philadelphia Peale's Museum. He was one of the founders, in 1805, of the Pennsylvania Academy of the Fine Arts at Philadelphia. At the age of eighty-one Peale painted a large canvas, "Christ Healing the Sick at Bethesda," and at eighty-three a full-length portrait of himself, now in the Academy of the Fine Arts. He died at his country home, near Germantown, Pennsylvania, on the 22nd of February 1826.

His brother, JAMES PEALE (1749–1831), also an artist, painted two portraits of Washington (one now the property of the New York Historical Society, and the other in Independence Hall, Philadelphia), besides landscapes and historical compositions.

PEALE, REMBRANDT (1778–1860), American artist, was born in Bucks county, Pennsylvania, on the 22nd of February 1778, the son of Charles Willson Peale (*q.v.*). He studied under his father, under Benjamin West in London (1802–1803), and in Paris in 1807 and 1809. As early as 1795 he had begun from life a portrait of Washington. Of this he made many replicas, the latest in 1823, purchased by the United States government in 1832, and now in the Capitol of Washington. Peale was one of the first of American lithographers. He was an excellent draughtsman, but in colour his work cannot rank with his father's. In 1843 he devised for the Philadelphia public schools a system of teaching drawing and penmanship. His portraits include those of President Jefferson, Mrs Madison, Commodores Perry, Decatur, and Bainbridge, Houdon the sculptor, General Armstrong, and an equestrian portrait of General Washington, now in Independence Hall, Philadelphia. His "Court of Death" (1820) is in the Detroit Art Gallery. In 1825 Peale succeeded John Trumbull as president of the American Academy of Fine Arts (founded in 1802 as the New York Academy of Fine Arts), and he was one of the original members of the National Academy of Design. He wrote several books, among them *Notes on Italy* (1831), *Reminiscences of Art and Artists* (1845). He died in Philadelphia on the 3rd of October 1860.

A brother, RAPHAELLE PEALE (1774–1825), was one of the earliest of American still-life painters; and another brother, TITIAN RAMSEY PEALE (1800–1885), made numerous drawings, some of them in water-colour, in illustration of animal life.

See "Rembrandt Peale," partly autobiographical, in C. E. Lester's *The Artists of America* (New York, 1846).

PEAR (*Pyrus communis*), a member of the natural order Rosaceae, belonging to the same genus as the apple (*P. malus*), which it resembles in floral structure. In both cases the so-called fruit is composed of the receptacle or upper end of the flower-stalk (the so-called calyx tube) greatly dilated, and enclosing within its cellular flesh the five cartilaginous carpels which constitute the "core" and are really the true fruit. From the upper rim of the receptacle are given off the five sepals, the five petals, and the very numerous stamens. The form of the pear and of the apple respectively, although usually characteristic enough, is not by itself sufficient to distinguish them, for there are pears which cannot by form alone be distinguished from apples, and apples which cannot by superficial appearance be recognized from pears. The main distinction is the occurrence in the tissue of the fruit, or beneath the rind, of clusters of cells filled with hard woody deposit in the case of the pear, constituting the "grit," while in the apple no such formation of woody cells takes place. The appearance of the tree—the bark, the foliage, the flowers—is, however, usually quite characteristic in the two species. Cultivated pears, whose number is enormous, are without doubt derived from one or two wild species widely distributed throughout Europe and western Asia, and sometimes forming part of the natural vegetation of the forests. In England, where the pear is sometimes considered wild, there is always the doubt that it may not really be so, but the produce of some seed of a cultivated tree deposited by birds or otherwise, which has degenerated into the wild spine-bearing tree known as *Pyrus communis*.

The cultivation of the pear extends to the remotest antiquity. Traces of it have been found in the Swiss lake-dwellings; it is mentioned in the oldest Greek writings, and was cultivated by the Romans. The word "pear" or its equivalent occurs in all the Celtic languages, while in Slavonic and other dialects different appellations, but still referring to the same thing, are found—a diversity and multiplicity of nomenclature which led Alphonse de Candolle to infer a very ancient coltivation of the tree from the shores of the Caspian to those of the Atlantic. A certain race of pears, with white down on the under surface of their leaves, is supposed to have originated from *P. nivalis*, and their fruit is chiefly used in France in the manufacture of Perry (see CIDER). Other small-fruited pears, distinguished by their precocity and apple-like fruit, may be referred to *P. cordata*, a species found wild in western France, and in Devonshire and Cornwall.

Karl Koch considered that cultivated pears were the descendants of three species—*P. persica* (from which the bergamots have descended), *P. elaeagrifolia* and *P. sinensis*. J. Decaisne, who made the subject one of critical study for a number of years, and not only investigated the wild forms, but carefully studied the peculiarities of the numerous varieties cultivated in the Jardin des Plantes at Paris, refers all cultivated pears to one species, the individuals of which have in course of time diverged in various directions, so as to form now six races: (1) the Celtic, including *P. cordata*; (2) the Germanic, including *P. communis*, *P. achras*, and *P. piraster*; (3) the Hellenic, including *P. parviflora*, *P. sinaica* and others; (4) the Pontic, including *P. elaeagrifolia*; (5) the Indian, comprising *P. Paschae*; and (6) the Mongolic, represented by *P. sinensis*. With reference to the Celtic race, *P. cordata*, it is interesting to note its connexion with Arthurian legend and the Isle of Avalon or Isle of Apples. An island in Loch Awe has a Celtic legend containing the principal features of Arthurian story; but in this case the word is "berries" instead of "apples." Dr Phené visited Armorica (Brittany) with a view of investigating these matters, and brought thence fruits of a small berry-like pear, which were identified with the *Pyrus cordata* of western France.

Cultivation.—The pear may be readily raised by sowing the pips of ordinary cultivated or of wilding kinds, these forming what are known as free or pear stocks, on which the choicer varieties are grafted for increase. For new varieties the flowers should be fertilized with a view to combine, in the seedlings which result from the union, the desirable qualities of the parents. The dwarf and pyramid trees, more usually planted in gardens, are obtained by grafting on the quince stock, the Portogal quince being the best; but this stock, from its surface-rooting habit, is most suitable for soils of a cold damp nature. The pear-stock, having an inclination to send its roots down deeper into the soil, is the best for light dry soils, as the plants are not then so likely to suffer in dry seasons. Some of the finer pears do not unite readily with the quince, and in this case double working is resorted to; that is to say, a vigorous-growing pear is first grafted on the quince, and then the choicer pear is grafted on the pear introduced as its foster parent.

In selecting young pear trees for walls or espaliers, some persons prefer plants one year old from the graft, but trees two or three years trained are equally good. The trees should be planted immediately before or after the fall of the leaf. The wall trees require to be planted from 25 to 30 ft. apart when on free stocks, and from 15 to 20 ft. when dwarfed. Where the trees are trained as pyramids or columns they may stand 8 or 10 ft. apart, but standards in orchards should be allowed at least 30 ft., and dwarf bush trees half that distance.

In the formation of the trees the same plan may be adopted as in the case of the apple. For the pear orchard a warm situation is very desirable, with a soil deep, substantial, and thoroughly drained. Any good free loam is soitable, but a calcareous loam is the best. Pear trees worked on the quince should have the stock covered up to its junction with the graft. This is effected by raising up a small mound of rich compost around it, a contrivance which induces the graft to emit roots into the surface soil,

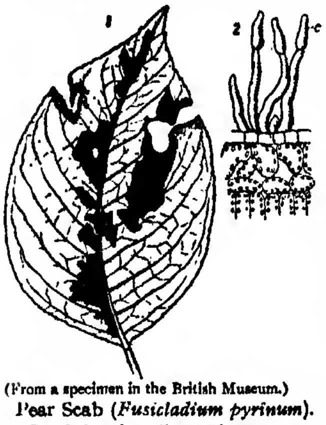
and also keeps the stock from becoming hard or bark-bound. The fruit of the pear is produced on spurs, which appear on shoots more than one year old. The mode most commonly adopted of training wall pear-trees is the horizontal. For the slender twiggy sorts the fan form is to be preferred, while for strong growers the half-fan or the horizontal is more suitable. In the latter form old trees, the summer pruning of which has been neglected, are apt to acquire an undue projection from the wall and become scraggy, to avoid which a portion of the old spurs should be cut out annually.

The summer pruning of established wall or espalier-rail trees consists chiefly in the timely displacing, shortening back, or rubbing off of the superfluous shoots, so that the winter pruning, in horizontal training, is little more than adjusting the leading shoots and thinning out the spurs, which should be kept close to the wall and allowed to retain but two or at most three buds. In fan-training the subordinate branches must be regulated, the spurs thinned out, and the young laterals finally established in their places. When horizontal trees have fallen into disorder, the branches may be cut back to within 9 in. of the vertical stem and branch, and trained in afresh, or they may be grafted with other sorts, if a variety of kinds is wanted.

Summer and autumn pears should be gathered before they are fully ripe, otherwise they will not in general keep more than a few days. The Jargonelle should be allowed to remain on the tree and be pulled daily as wanted, the fruit from standard trees thus succeeding the produce of the wall trees. In the case of the Crassane the crop should be gathered at three different times, the first a fortnight or more before it is ripe, the second a week or ten days after that, and the third when fully ripe. The first gathering will come into eating latest, and thus the season of the fruit may be considerably prolonged. It is evident that the same method may be followed with other sorts which continue only a short time in a mature state.

Diseases.—The pear is subject to several diseases caused by fungi. *Gymnosporangium sabinae*, one of the rusts (Uredineae) passes one stage of its life-history on living pear leaves, forming large raised spots or patches which are at first yellow but soon become red and are visible on both faces; on the lower face of each patch is a group of cluster-cups or accidia containing spores which escape when ripe. This stage in the life-history was formerly regarded as a distinct fungus with the name *Roestelia cancellata*; it is now known, however, that the spores germinate on young juniper leaves, in which they give rise to this other stage in the plant's history known as *Gymnosporangium*. The gelatinous, generally reddish-brown masses of spores—the teleutospores—formed on the juniper in the spring germinate and form minute spores—*sporidia*—which give rise to the aecidium stage on the pear. Diseased pear leaves should be picked off and destroyed before the spores are scattered and the various species of juniper on which the alternate stage is developed should not be allowed near the pear trees.

Pear scab is caused by a parasitic fungus, *Fusicladium pyrinum*, very closely allied and perhaps merely a form of the apple scab fungus, *F. dendriticum*. As in the case of the apple disease it forms large irregular blackish blotches on the fruit and leaves, the injury being often very severe especially in a cool, damp season. The fungus mycelium grows between the cuticle and the epidermis, the former being ultimately ruptured by numerous short branches bearing spores (conidia) by means of which the disease is spread. As a preventive repeated spraying with dilute Bordeaux mixture is recommended, during the flowering season and early development of the fruit. Similar spraying is recommended for pear-leaf blister caused by *Taphrina bullata*, which forms swollen areas on the leaves. Pear trees may also be attacked by a great variety of insect pests. Thus the younger branches are often injured by the pearl oyster scale (*Aspidiotus ostreaeformis*), which may be removed by washing in winter with soft soap and hot water. A number of larvae of *Lepidoptera* feed on the leaves—the remedy is to capture the mature insects when possible. The winter moth (*Cheimatobia brumata*) must be kept in check by putting greasy bands round the trunks from October till December or January, to catch the wingless females that crawl up and deposit their eggs in the cracks and crevices in the bark. The caterpillars of the leopard moth (*Zeuzera pyrina*) and of the goat moth (*Cossus ligniperda*) sometimes bore their way into the trunks and destroy the sap channels. If badly bored, the trees are useless but in the early stages if the entrance of the caterpillars has been detected, a wire should be pushed into the hole. One of the worst pests of pear trees is the pear midge, known as *Diplosis pyrivora* or *Cecidomyia nigra*, the females of which lay their eggs in the flower-buds before they open. The yellow maggots devour the seeds and thus ruin the crop. When deformed fruits are noticed they should be picked off and burned immediately. Species of aphides may be removed by tobacco infusion, soapsuds or other solutions. A gall mite (*Phytoptus pyri*) sometimes severely injures the leaves, on which it forms blisters—the best remedy is to cut off and burn the diseased leaves.

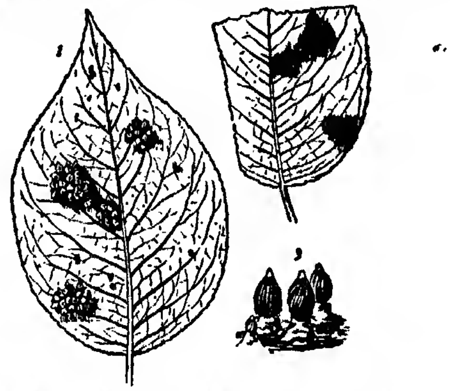


(From a specimen in the British Museum.)

Pear Scab (*Fusicladium pyrinum*).

1, Leaf showing diseased areas.

2, Section of leaf-surface showing the spores or *conidia*, *c*, borne on long stalks (conidiophores) × 250.



Pear-leaf Cluster-cups (*Gymnosporangium sabinae*).

1, Leaf showing groups of cups or accidia. 2, Early stage of disease. 3, Cups enlarged × 5.

The Alligator or Avocado Pear is *Persea gratissima*, a member of the natural order Lauraceae, and a native of the West Indies and other parts of tropical America. It is a tree of 25 to 30 ft. high and bears large pear-shaped fruits, green or deep purple in colour, with a firm yellowish-green marrow-like pulp surrounding a large seed. The pulp is much esteemed in the West Indies and is eaten as a salad, usually with the addition of pepper, salt and vinegar. The pulp contains much oil, which is used for lighting and soap-making, and the seeds yield a deep indelible black stain which is used for marking linen.

Prickly pear is the popular name for species of *Opuntia* (see CACTUS).

The name wooden pear is applied to the fruits of *Xylomelum* (nat. ord. Proteaceae), an Australian genus of trees with very thick, woody, inversely pear-shaped fruits which split into two parts when ripe.

PEARCE, CHARLES SPRAGUE (1851–), American artist, was born at Boston, Massachusetts, on the 13th of October 1851. In 1873 he became a pupil of Léon Bonnat in Paris, and after 1885 he lived in Paris and at Auvers-sur-Oise. He painted Egyptian and Algerian scenes, French peasants, and portraits, and also decorative work, notably for the Congressional Library at Washington. He received medals at the Paris Salon and elsewhere, and was decorated with the Legion of Honour, the order of Leopold, Belgium, the order of the Red Eagle, Prussia, and the order of Dannebrog, Denmark. Among his best known paintings are "The Decapitation of St John the Baptist" (1881), in the Art Institute of Chicago; "Prayer" (1884), owned by the Massachusetts Charitable Mechanic Association; "The Return of the Flock," in the Bohemian Club, San Francisco; and "Meditation," in the New York Metropolitan Museum.

PEARL. Pearls are calcareous concretions of peculiar lustre, produced by certain molluscs, and valued as objects of personal ornament. The experience of pearl-fishers shows that those shells which are irregular in shape and stunted in growth, or

which bear excrescences, or are honeycombed by boring parasites, are those most likely to yield pearls.

The substance of a pearl is essentially the same as that which lines the interior of many shells and is known as "mother-of-pearl." Sir D. Brewster first showed that the iridescence of this substance was an optical phenomenon due to the interference of rays of light reflected from microscopic corrugations of the surface—an effect which may be imitated by artificial striations on a suitable medium. When the inner laminated portion of a nacreous shell is digested in acid the calcareous layers are dissolved away, leaving a very delicate membranous pellicle, which, as shown by Dr Carpenter, may retain the iridescence as long as it is undisturbed, but which loses it when pressed or stretched.

It is obvious that if a pearl presents a perfectly spherical form it must have remained loose in the substance of the muscles or other soft tissues of the mollusc. Frequently, however, the pearl becomes cemented to the interior of the shell, the point of attachment thus interfering with its symmetry. In this position it may receive successive nacreous deposits, which ultimately form a pearl of hemispherical shape, so that when cut from the shell it may be flat on one side and convex on the other, forming what jewelers know as a "perle bouton." In the course of growth the pearl may become involved in the general deposit of mother-of-pearl, and be ultimately buried in the substance of the shell. It has thus happened that fine pearls have occasionally been unexpectedly brought to light in cutting up mother-of-pearl in the workshop.

When a pearl oyster is attacked by a boring parasite the mollusc protects itself by depositing nacreous matter at the point of invasion, thus forming a hollow body of irregular shape known as a "blister pearl." Hollow warty pearl is sometimes termed in trade "coq de perle." Solid pearls of irregular form are often produced by deposition on rough objects, such as small fragments of wood, and these, and in fact all irregular-shaped pearls, are termed "perles baroques," or "barrok pearls." It appears that the Romans in the period of the Decline restricted the name *unio* to the globular pearl, and termed the baroque *margaritum*. It was fashionable in the 16th and 17th centuries to mount curiously shaped baroques in gold and enamel so as to form ornamental objects of grotesque character. A valuable collection of such mounted pearls by Dinglinger is preserved in the Green vaults at Dresden.

A pearl of the first water should possess, in jewelers' language, a perfect "skin" and a fine "orient"; that is to say, it must be of delicate texture, free from speck or flaw, and of clear almost translucent white colour, with a subdued iridescent sheen. It should also be perfectly spherical, or, if not, of a symmetrical pear-shape. On removing the outer layer of a pearl the subjacent surface is generally dull, like a dead fish-eye, but it occasionally happens that a poor pearl encloses a "lively kernel," and may therefore be improved by careful peeling. The most perfect pearl in existence is said to be one, known as "La Pellegrina," in the museum of Zosima in Moscow; it is a perfectly globular Indian pearl of singular beauty, weighing 28 carats. The largest known pearl is one of irregular shape in the Beresford Hope collection at the Victoria and Albert Museum. This magnificent pearl weighs 3 oz., has a circumference of 4½ in., and is surmounted by an enamelled and jewelled gold crown, forming a pendant of great value.

Pearl Fisheries.—The ancients obtained their pearls chiefly from India and the Persian Gulf, but at the present time they are also procured from the Sulu seas, the coast of Australia, the shores of Central America and some of the South Pacific Islands. The ancient fisheries of Ceylon (Taprobane) are situated in the Gulf of Manaar, the fishing-banks lying from 6 to 8 m. off the we tern shore, a little to the south of the isle of Manaar. The Tinnevelly fishery is on the Madras side of the strait, near Tuticorin. These Indian fishing-grounds are under the control of government inspectors, who regulate the fisheries. The oysters yield the best pearls at about four years of age. Fishing generally commences in the second week in March, and lasts for from four to six weeks, according to the season. The boats are grouped in fleets of from sixty to seventy, and start usually at midnight so as to reach the oyster-banks at sunrise. Each boat generally carries ten divers. On reaching the bank a signal-gun is fired, and diving commences. A stone weighing about 40 lb is attached to the cord by which the diver is let down. The divers work in pairs, one man diving while the other watches the signal-cord, drawing up the sink-stone first, then hauling up the baskets of oysters, and finally raising the diver himself. On an average the divers remain under water from fifty to eighty seconds, though exceptional instances are cited of men remaining below for as long as six minutes. After resting for a minute or two at the surface, the diver descends again; and so on, until exhausted, when he comes on board and watches the rope, while his comrade relieves him as diver. The native descends naked, carrying only a girdle for the support of the basket in which he places the pearl oysters. In his submarine work the diver makes skilful use of his toes. To arm himself against the attacks of the sharks and other fishes which infest the Indian waters he carries spikes of iron-wood; and the genuine Indian diver never descends without the incantations of shark-charmers, one of whom accompanies the boat while others remain on s' ore. As a rule the diver is a short-lived man.

The diving continues from sunrise to about noon, when a gun is fired. On the arrival of the fleet at shore the divers carry their oysters to a shed, where they are made up into four heaps, one of which is taken by the diver. The oysters are then sold by auction in lots of 1000 each. The pearls, after removal from the dead oysters, are "classed" by passing through a number of small brass colanders, known as "baskets," the holes in the successive vessels being smaller and smaller. Having been sized in this way, they are sorted as to colour, weighed and valued.

Since the days of the Macedonians pearl-fishing has been carried on in the Persian Gulf. It is said that the oyster-beds extend along the entire Arabian coast of the gulf, but the most important are on sandbanks off the islands of Bahrein. The chief centre of the trade is the port of Lingah. Most of the products of this fishery are known as "Bombay pearls," from the fact that many of the best are sold there. The shells usually present a dark colour about the edges, like that of "smoked pearl." The yellow-tinted pearls are sent chiefly to Bombay, while the whitest go to Bagdad. Very small pearls, much below a pea in size, are generally known as "seed-pearls," and these are valued in India and China as constituents of certain electuaries, while occasionally they are calcined for *chunam*, or lime, used with betel as a masticatory. There is a small pearl-fishery near Karachi on the coast of Bombay.

From the time of the Ptolemies pearl-fishing has been prosecuted along the coast of the Red Sea, especially in the neighbourhood of Jiddah and Koseir. This fishery is now insignificant, but the Arabs still obtain from this district a quantity of mother-of-pearl shells, which are shipped from Alexandria, and come into the market as "Egyptians."

Very fine pearls are obtained from the Sulu Archipelago, on the north-east of Borneo. The mother-of-pearl shells from the Sulu seas are characterized by a yellow colour on the border and back, which unfits them for many ornamental purposes. Pearl-oysters are also abundant in the seas around the Aru Islands to the south-west of New Guinea. From Labuan a good many pearl-shells are occasionally sent to Singapore. They are also obtained from the neighbourhood of Timor, and from New Caledonia. The pearl-oyster occurs throughout the Pacific, mostly in the clear water of the lagoons within the atolls, though fine shells are also found in deep water outside the coral reefs. The Polynesian divers do not employ sink-stones, and the women are said to be more skilful than the men. They anoint their bodies with oil before diving. Fine pearl-shells are obtained from Navigators Islands, the Society Islands, the Low Archipelago or Paumota Isles and the Gambier Islands. Many of the Gambier pearls present a bronzy tint.

Pearl-fishing is actively prosecuted along the western coast of Central America, especially in the Gulf of California, and to a less extent around the Pearl Islands in the Bay of Panama. The

fishing-grounds are in water about 40 ft. deep, and the season lasts for four months. An ordinary fishing-party expects to obtain about three tons of shells per day, and it is estimated that one shell in a thousand contains a pearl. The pearls are shipped in barrels from San Francisco and Panama. Some pearls of rare beauty have been obtained from the Bay of Mulege, near Los Coyetes, in the Gulf of California; and in 1882 a pearl of 75 carats, the largest on record from this district, was found near La Paz in California. The coast of Guayaquil also yields pearls. Columbus found that pearl-fishing was carried on in his time in the Gulf of Mexico, and pearls are still obtained from the Caribbean Sea. In the West Indies the best pearls are obtained from St Thomas and from the island of Margarita, off the coast of Venezuela. From Margarita Philip II. of Spain is said to have obtained in 1579 a famous pearl of 250 carats.

Of late years good pearls have been found in Shark's Bay, on the coast of West Australia, especially in an inlet termed Useless Harbour. Mother-of-pearl shells are also fished at many other points along the western coast, between the 15th and 25th parallels of south latitude. An important pearl-fishery is also established in Torres Strait and on the coast of Queensland. The shells occur in water from four to six fathoms deep, and the divers are generally Malays and Papuans, though sometimes native Australians. On the western coast of Australia the pearl-shells are obtained by dredging rather than by diving. Pearl-shells have also been found at Port Darwin and in Oakley Creek, New Zealand.

River pearls are produced by the species of *Unio* and *Anodonta*, especially by *Unio margaritiferus*. These species belong to the family Unionidae, order Eulamellibranchia. They inhabit the mountain-streams of temperate climates in the northern hemisphere—especially in Scotland, Wales, Ireland, Saxony, Bohemia, Bavaria, Lapland and Canada. The pearls of Britain are mentioned by Tacitus and by Pliny, and a breastplate studded with British pearls was dedicated by Julius Caesar to Venus Genetrix. As early as 1355 Scotch pearls are referred to in a statute of the goldsmiths of Paris; and in the reign of Charles II. the Scotch pearl trade was sufficiently important to attract the attention of parliament. The Scotch pearl-fishery, after having declined for years, was revived in 1860 by a German named Moritz Unger, who visited Scotland and bought up all the pearls he could find in the hands of the peasantry, thus leading to an eager search for more pearls the following season. It is estimated that in 1865 the produce of the season's fishing in the Scotch rivers was worth at least £12,000. This yield, however, was not maintained, and at the present time only a few pearls are obtained at irregular intervals by an occasional fisherman.

The principal rivers in Scotland which have yielded pearls are the Spey, the Tay and the South Esk; and to a less extent the Doon, the Dee, the Don, the Ythan, the Teith, the Forth and many other streams. In North Wales the Conway was at one time celebrated for its pearls; and it is related that Sir Richard Wynn, chamberlain to the queen of Charles II., presented her with a Conway pearl which is believed to occupy a place in the British crown. In Ireland the rivers of Donegal, Tyrone and Wexford have yielded pearls. It is said that Sir John Hawkins the circumnavigator had a patent for pearl-fishing in the Irt in Cumberland. Although the pearl-fisheries of Britain are now neglected, it is otherwise with those of Germany. The most important of these are in the forest-streams of Bavaria, between Ratisbon and Passau. The Saxon fisheries are chiefly confined to the basin of the White Elster, and those of Bohemia to the Horazdiowitz district of Wotawa. For more than two centuries the Saxon fisheries have been carefully regulated by inspectors, who examine the streams every spring, and determine where fishing is to be permitted. After a tract has been fished over, it is left to rest for ten or fifteen years. The fisher-folk open the valves of the mussels with an iron instrument, and if they find no pearl restore the mussel to the water.

River-pearls are found in many parts of the United States, and have been systematically worked in the Little Miami river, Warren county, Ohio, and also on the Mississippi, especially about Muscatine, Iowa. The season extends from June to October. Japan produces fresh-water pearls, found especially in the *Anodonta japonica*. But it is in China that the culture of the pearl-mussel is carried to the greatest perfection. The Chinese also obtain marine pearls, and use a large quantity of mother-of-pearl for decorative purposes. More than twenty-two centuries before our era pearls are enumerated as a tribute or tax in China; and they are mentioned as products of the western part of the empire in the *Rh'ya*, a dictionary compiled earlier than 1000 B.C. A process for promoting the artificial formation of pearls in the Chinese river-mussels was discovered by Ye-jin-yang, a native of Hoochow, in the 13th century; and this process is still extensively carried on near the city of Tch-tsing, where it forms the staple industry of several villages, and is said to give employment to about 5000 people. Large numbers of the mussels are collected in May and June, and the valves of each are gently opened with a spatula to allow of the introduction of various foreign bodies, which are inserted by means of a forked bamboo stick. These "matrices" are generally pellets of prepared mud, but may be small bosses of bone, brass or wood. After a number of these objects have been placed in convenient positions on one valve, the unfortunate mollusc is turned over and the operation is repeated on the other valve. The mussels are then placed in shallow ponds connected with the canals, and are nourished by tubs of night-soil being thrown in from time to time. After several months, in some cases two or three years, the mussels are removed, and the pearls which have formed over the matrices are cut from the shells, while the molluscs themselves serve as food. The matrix is generally extracted from the pearl and the cavity filled with white wax, the aperture being neatly sealed up so as to render the appearance of the pearl as perfect as possible. Millions of such pearls are annually sold at Soo-chow. The most curious of these Chinese pearls are those which present the form of small seated images of Buddha. The figures are cast in very thin lead, or stamped in tin, and are inserted as previously described. Specimens of these Buddha pearls in the British Museum are referred to the species *Dipsas plicata*. It should be mentioned that Linnaeus, probably ignorant of what had long been practised in China, demonstrated the possibility of producing artificial pearls in the fresh-water mussels of Sweden.

Pink pearls are occasionally found in the great conch or fountain shell of the West Indies, *Strombus gigas*, L.; but these, though much prized, are not nacreous, and their tint is apt to fade. They are also produced by the chank shell, *Turbinella scolymus*, L.[1] Yellowish-brown pearls, of little or no value, are yielded by the *Pinna squamosa*, and bad-coloured concretions are formed by the *Placuna placenta*.[2] Black pearls, which are very highly valued, are obtained chiefly from the pearl-oyster of the Gulf of Mexico. The common marine mussel *Mytilus edulis* also produces pearls, which are, however, of little value.

According to the latest researches the cause of pearl-formation is in most cases, perhaps in all, the dead body of a minute parasite within the tissues of a mollusc, around which nacreous deposit is secreted. The parasite is a stage in the life-history of a Trematode in some cases, in others of a Cestode; that is to say of a form resembling the common liver-fluke of the sheep, or of a tapeworm. As long ago as 1852 Filippi of Turin showed that the species of Trematode *Distomum duplicatum* was the cause of a pearl formation in the fresh-water mussel *Anodonta*. Kuchenmeister subsequently investigated the question at Elster in Saxony and came to a different conclusion, namely that the central body of the pearl was a small specimen of a species of water mite which is a very common parasite of *Anodonta*. Filippi however states that the mite is only rarely found within a pearl, the Trematode occurring in the great majority of cases. R. Dubois and Dr H. Lyster Jameson have made special investigations of the process in the common mussel *Mytilus edulis*. The latter states that the pearl is produced in a sac which is situated beneath the epidermis of the mantle and is lined by an epithelium. This epithelium is not derived from the cells of the epidermis but from the internal connective-tissue cells. This statement, if correct, is contrary to what would be expected, for calcareous matter is usually secreted by the external epidermis only. The sac or cyst is formed by the larva of a species of Trematode belonging to the genus *Leucithodendrium*, a species closely resembling and probably identical with *L. somateriae*, which lives in the adult state in the eider duck. At Billiers, Morbihan, in France, the host of the adult Trematode is another species of duck, namely the common Scoter, *Oedemia nigra*, which is notorious in the locality for its avidity for mussels. Trematodes of the family Distomidae, to which the parasite under consideration belongs, usually have three hosts in each of which they pass different stages of the life-history. In this case the first host at Billiers is a species of bivalve called *Tapes decussatus*, but at Piel in Lancashire there are no Tapes and the first stages of the parasite are found in the common cockle. The Trematode enters the first host as a minute newly hatched embryo and

[1] *Strombus gigas*, L., is a Gastropod belonging to the family Strombidae, of the order Pectinibranchia. *Turbinella scolymus*, Lam., is a Gastropod of the same order.

[2] *Placuna placenta*, L., belongs to the family Anomiidae; it is found on the shores of North Australia. *Pinna squamosa*, Gmelin, belongs to the Ostreacea; it occurs in the Mediterranean. Both are Lamellibranchs.

leaves it in the form called Cercaria, which is really an immature condition of the adult. The Cercaria makes its way into the tissues of a mussel and there becomes enclosed in the cyst previously described. If the mussel is then swallowed by the duck the Cercariae develop into adult Trematodes or flukes in the liver or intestines of the bird. In the mussels which escape being devoured the parasites cannot develop further, and they die and become embedded in the nacreous deposit which forms a pearl. Dr Jameson points out that, as in other cases, pearls in Mytilus are common in certain special localities and rare elsewhere, and that the said localities are those where the parasite and its hosts are plentiful.

The first suggestion that the most valuable pearls obtained from pearl oysters in tropical oceans might be due to parasites was made by Kelaart in reports to the government of Ceylon in 1857–1859. Recently a special investigation of the Ceylon pearl fishery has been organized by Professor Herdman. Herdman and Hornell find that in the pearl oyster of Ceylon *Margaritifera vulgaris*, Schum, the nucleus of the pearl is, in all specimens examined, the larva of a Cestode or tapeworm. This larva is of globular form and is of the type known as a cysticercus. As in the case of the mussel the larva dies in its cyst and its remains are enshrined in nacreous deposit, so that, as a French writer has said, the ornament associated in all ages with beauty and riches is nothing but the brilliant sarcophagus of a worm.

The cysticercus described by Herdman and Hornell has on the surface a muscular zone within which is a depression containing a papilla which can be protruded. It was at first identified as the larva of a tapeworm called Tetrarhynchus, and Professor Herdman concluded that the life-history of the pearl-parasite consisted of four stages, the first being exhibited by free larvae which were taken at the surface of the sea, the second that in the pearl-oyster, the third a form found in the bodies of file-fishes which feed on the oysters, and the fourth or adult stage living in some species of large ray. It has not however been proved that the pearl parasite is a Tetrarhynchus, nor that it is connected with the free larva or the form found in the file-fish, Balistes; nor has the adult form been identified. All that is certain is that the pearls are due to the presence of a parasite which is the larva of a Cestode; all the rest is probability or possibility. A French naturalist, M. Seurat, studying the pearl oyster of the Gambier Archipelago in the Pacific, found that pearl formation was due to a parasite quite similar to that described by Herdman and Hornell. This parasite was described by Professor Giard as characterized by a rostrum armed with a single terminal sucker and he did not identify it with Tetrarhynchus.

Genuine precious pearls and the most valuable mother-of-pearl are produced by various species and varieties of the genus *Meleagrina* of Lamarck, for which Dr Jameson in his recent revision of the species prefers the name *Margaritifera*. The genus is represented in tropical regions in all parts of the world. It belongs to the family Aviculidae, which is allied to the Pectens or scallop shells. In this family the hinge border is straight and prolonged into two auriculae; the foot has a very stout byssus. *Meleagrina* is distinguished by the small size or complete absence of the posterior auricula. The species are as follows. The type species is *Meleagrina margaritifera*, which has no teeth on the hinge. Geographical races are distinguished by different names in the trade. Specimens from the Malay Archipelago have a dark band along the margin of the nacre and are known as black-edged Banda shell; those from Australia and New Guinea and the neighbouring islands of the western Pacific are called Australian and New Guinea black-lip. Another variety occurs in Tahiti, Gambier Islands and Eastern Polynesia generally, yielding both pearls and shell. It occurs also in China, Ceylon, the Andaman Islands and the Maldives. Another form is taken at Zanzibar, Madagascar, and the neighbouring islands, and is called Zanzibar and Madagascar shell. Bombay shell is another local form fished in the Persian Gulf and shipped via Bombay. The Red Sea variety is known as Egyptian shell. Another variety occurs along the west coast of America and from Panama to Vancouver, and supplies Panama shell and some pearls. A larger form, attaining a foot in diameter and a weight of 10 lb per pair of shells, is considered as a distinct species by Dr Jameson and named *Margaritifera maxima*. It is found along the north coast of Australia and New Guinea and the Malay Archipelago. The nacreous surface of this shell is white, without the black or dark margin of the common species; it is known in the trade as the silver-lip, gold-lip and by other names. It is the most valuable species of mother-of-pearl oyster.

Dr Jameson distinguishes in addition to the above thirty-two species of *Margaritifera* or *Meleagrina*; all these have rudimentary teeth on the hinge. The most important species is *Meleagrina vulgaris*, to which belong the pearl oyster of Ceylon and southern India, the lingah shell of the Persian Gulf and the pearl oyster of the Red Sea. Since the opening of the Suez Canal the latter form has invaded the Mediterranean, specimens having been taken at Alexandria and at Malta, and attempts have been made to cultivate it on the French coast. The species occurs also on the coasts of the Malay Peninsula, Australia and New Guinea, where it is fished both for its shells (Australian lingah) and for pearls. Two species occur on the coasts of South Africa but have no market value. *Meleagrina carchariarum* is the Shark's Bay shell of the London market. It is taken in large quantities at Shark's Bay, Western Australia, and is of rather small value; it also yields pearls of inferior quality. The pearl-oyster of Japan, known as Japan lingah, is probably a variety of *Meleagrina vulgaris*. *Meleagrina radiata* is the West Indian pearl oyster.

The largest and steadiest consumption of mother-of pearl is in the button trade, and much is also consumed by cutlers for handles of fruit and dessert knives and forks, pocket-knives, &c. It is also used in the inlaying of Japanese and Chinese lacquers, European lacquered papier-mâché work, trays, &c., and as an ornamental inlay generally. The carving of pilgrim shells and the elaboration of crucifixes and ornamental work in mother-of-pearl is a distinctive industry of the monks and other inhabitants of Bethlehem. Among the South Sea Islands the shell is largely fashioned into fishing-hooks. Among shells other than those of *Meleagrina margaritifera* used as mother-of-pearl may be mentioned the Green Ear or Ormer shell (*Haliotis tuberculata*) and several other species of *Haliotis*, besides various species of *Turbo*.

Artificial pearls were first made in western Europe in 1680 by Jacquin, a rosary-maker in Paris, and the trade is now largely carried on in France, Germany and Italy. Spheres of thin glass are filled with a preparation known as "essence d'orient," made from the silvery scales of the bleak or "ablette," which is caused to adhere to the inner wall of the globe, and the cavity is then filled with white wax. Many imitation pearls are now formed of an opaline glass of nacreous lustre, and the soft appearance of the pearl obtained by the judicious use of hydrofluoric acid. An excellent substitute for black pearl is found in the so-called "ironstone jewelry," and consists of close-grained haematite, not too highly polished; but the great density of the haematite immediately destroys the illusion. Pink pearls are imitated by turning small spheres out of the rosy part of the conch shell, or even out of pink coral.

Soc.* (1902), pl. 1; idem, "On the Identity and Distribution of Mother-of-Pearl Oysters," *Proc. Zool Soc.* (1901), pl. 1, pp. 372–394; Herdman and Hornell, *Rep. Ceylon Pearl Fisheries* (London, Royal Soc., 1903); and Kunz and Stevenson, *Book of the Pearl* (New York, 1908), with bibliography. (J. T. C.)

PEARL, THE. The Middle-English poem known as *Pearl*, or *The Pearl*, is preserved in the unique manuscript Cotton Nero Ax at the British Museum; in this volume are contained also the poems *Cleanness*, *Patience*, and *Sir Gawayne and the Green Knight*. All the pieces are in the same handwriting, and from internal evidences of dialect, style and parallel references, it is now generally accepted that the poems are all by the same author. The MS., which is quaintly illustrated, belongs to the end of the 14th or the beginning of the 15th century, and appears to be but little later than the date of composition; no line of *Pearl* or of the other poems is elsewhere to be found.

Pearl is a poet's lament for the loss of a girl-child, "who lived not upon earth two years"—the poet is evidently the child's father. In grief he visits the little grave, and there in a vision beholds his Pearl, now transfigured as a queen of heaven—he sees her beneath "a crystal rock," beyond a stream; the dreamer would fain cross over, but cannot. From the opposite bank Pearl, grown in wisdom as in stature, instructs him in lessons of faith and resignation, expounds to him the mystery of her transfiguration, and leads him to a glimpse of the New Jerusalem. Suddenly the city is filled with glorious maidens, who in long procession glide towards the throne, all of them clad in white, pearl-bedecked robes as Pearl herself. And there he sees, too, "his little queen." A great love-longing possesses him to be by her. He must needs plunge

into the stream that keeps him from her. In the very effort the dreamer awakes, to find himself resting upon the little mound where his Pearl had "strayed below":-

> "I roused me, and fell in great dismay,
> And, sighing, to myself I said:
> Now all be to that Prince's pleasure."

The poem consists of one hundred and one stanzas, each of twelve lines, with four accents, rhymed *ab*, *ab*, *ab*, *ab*, *bc*, *bc*; the versification combines rhyme with alliteration; trisyllabic effects add to the easy movement and lyrical charm of the lines. Five stanzas (in one case six), with the same refrain, constitute a section, of which accordingly there are twenty in all, the whole sequence being linked together by the device of making the first line of each stanza catch up the refrain of the previous verse, the last line of the poem re-echoing the first line. The author was not the creator of this form, nor was he the last to use it. The extant pieces in the metre are short religious poems, some of the later (*e.g. God's Complaint*, falsely attributed to Scottish authorship) revealing the influence of *Pearl*.

The dialect is West Midland, or rather North-West Midland, and the vocabulary is remarkable for the blending of native speech with Scandinavian and Romance elements, the latter partly Anglo-French, and partly learned French, due to the author's knowledge of French literature.

"While the main part of the poem," according to Gollancz, "is a paraphrase of the closing chapters of the Apocalypse and the parable of the Vineyard, the poet's debt to the *Romaunt of the Rose* is noteworthy, more particularly in the description of the wonderful land through which the dreamer wanders; and it can be traced throughout the poem, in the personification of Pearl as Reason, in the form of the colloquy, in the details of dress and ornament, in many a characteristic word, phrase and reference. 'The river from the throne,' in the Apocalypse, here meets 'the waters of the wells' devised by Sir Mirth for the Garden of the Rose. From these two sources, the Book of Revelation, with its almost Celtic glamour, and *The Romaunt of the Rose*, with its almost Oriental allegory, are derived much of the wealth and brilliancy of the poem. The poet's fancy revels in the richness of the heavenly and the earthly paradise, but his fancy is subordinated to his earnestness and intensity."

The leading *motifs* of *Pearl* are to be found in the Gospel—in the allegory of the merchant who sold his all to purchase one pearl of great price, and in the words, so fraught with solace for the child-bereft, "for of such is the Kingdom of Heaven." Naturally arising from the theme, and from these *motifs*, some theological problems of the time are touched upon, or treated somewhat too elaborately perhaps, and an attempt has been made to demonstrate that *Pearl* is merely allegorical and theological, and not really a lament. Those who hold this view surely ignore or fail to recognize the subtle personal touches whereby the poem transcends all its theological interests, and makes its simple and direct appeal to the human heart. Herein, too, lies its abiding charm, over and above the poetical talent, the love of nature, colour and the picturesque, the technical skill, and the descriptive power, which in a high degree belonged to the unknown poet.

Various theories have been advanced as to the authorship of *Pearl* and the other poems in the manuscript. The claims of Huchown "of the Awle Ryale" have been vigorously (but unsuccessfully) advocated; the case in favour of Ralph Strode (Chaucer's "philosophical Strode")—the most attractive of all the theories—is still, unfortunately, "not proven." By piecing together the personal indications to be found in the poems an imaginary biography of the poet may be constructed. It may safely be inferred that he was born about 1330, somewhere in Lancashire, or a little to the north; that he delighted in open-air life, in woodcraft and sport; that his early life was passed amid the gay scenes that brightened existence in medieval hall and bower; that he availed himself of opportunities of study, theology and romance alike claiming him; that he wedded, and had a child named Margery or Marguerite—the Daisy, or the Pearl—at whose death his happiness drooped and life's joy ended.

The four poems are closely linked and belong to one period of the poet's career. In *Gawayne*, probably the first of the four, the poet is still the minstrel rejoicing in the glamour of the Arthurian tale, but using it, in almost Spenserian spirit, to point a moral. In *Pearl* the minstrel has become the elegiac poet, harmonizing the old Teutonic form with the newer Romance rhyme. In *Cleanness* he has discarded all attractions of form, and writes, in direct alliterative metre, a stern homily on chastity. In *Patience*—a homiletic paraphrase of Jonah—he appears to be autobiographical, reminding himself, while teaching others, that "Poverty and Patience are needs playfellows." He had evidently fallen on evil days.

It is noteworthy that soon after 1358 Boccaccio wrote his Latin eclogue *Olympia* in memory of his young daughter Violante. A comparative study of the two poems is full of interest; the direct influence of the Latin on the English poem is not so clear as has been maintained. *Pearl* cannot be placed earlier than 1360; it is most probably later than *Olympia*.

Bibliography.—*Texts and Translations*: *Early Alliterative Poems in the West Midland Dialect of the Fourteenth Century* (edited by Richard Morris, Early English Text Society I. 1864; revised, 1869, 1885, 1896, 1901); *Pearl, an English Poem of the Fourteenth Century, edited, with a Modern Rendering*, by Israel Gollancz (with frontispiece by Holman Hunt, and prefatory lines, sent to the editor by Tennyson); revised edition of the text, privately printed, 1897; new edition of text and translation, "King's Classics," 1910-1911; Facsimile of MS. Cotton Nero Ax, 1910-1911; *The Pearl*, (edited by C. G. Osgood; Boston, 1906). Translations by Gollancz (as above); G. G. Coulton (1906); Osgood (1907); Miss Mead (1908); Miss Jewett (1908); part of the poem, by S. Weir Mitchell (1906).

PEARSALL, ROBERT LUCAS DE (1795-1856), English composer, was born on the 14th of March 1795, at Clifton. Educated for the bar, he practised till 1825, when he left England for Germany and studied composition under Panny of Mainz; with the exception of three comparatively short visits to England, during one of which he made the acquaintance of the English school of madrigals, he lived abroad, selling his family property of Willsbridge and settling in the castle of Wartensee, on the lake of Constance. He produced many works of lasting beauty, nearly all of them for voices in combination: from his part songs, such as "Oh, who will o'er the downs?" to his elaborate and scholarly madrigals, such as the admirable eight-part compositions, "Great God of Love" and "Lay a Garland," or the beautiful "Light of my Soul." His reception into the Roman Church in his later years may have suggested the composition of some beautiful sacred music, among other things a fine "Salve Regina." He wrote many valuable treatises on music, and edited a Roman Catholic hymn-book. He died on the 5th of August 1856.

PEARSON, CHARLES HENRY (1830-1894), British historian and colonial statesman, was born in London on the 7th of September 1830. After receiving his early education at Rugby and King's College, London, he went up to Oxford, where he

was generally regarded as the most brilliant of an exceptionally able set, and in 1854 obtained a fellowship at Oriel College. His constitutional weakness and bad eyesight forced him to abandon medicine, which he had adopted as a career, and in 1855 he returned to King's College as lecturer in English language and literature, a post which he almost immediately quitted for the professorship of modern history. He made numerous journeys abroad, the most important being his visit to Russia in 1858, his account of which was published anonymously in 1859 under the title of *Russia, by a Recent Traveller*; an adventurous journey through Poland during the insurrection of 1863, of which he gave a sympathetic and much praised account in the *Spectator*; and a visit to the United States in 1868, where he gathered materials for his subsequent discussion of the negro problem in his *National Life and Character*. In the meantime, besides contributing regularly, first to the *Saturday Review* and then to the *Spectator*, and editing the *National Review*, he wrote the first volume of *The Early and Middle Ages of England* (1861). The work was bitterly attacked by Freeman, whose "extravagant Saxonism" Pearson had been unable to adopt. It appeared in 1868 in a revised form with the title of *History of England during the Early and Middle Ages*, accompanied by a second volume which met with general recognition. Still better was the reception of his admirable *Maps of England in the First Thirteen Centuries* (1870). But as the result of these labours he was threatened with total blindness; and, disappointed of receiving a professorship at Oxford, in 1871 he emigrated to Australia. Here he married and settled down to the life of a sheep-farmer; but finding his health and eyesight greatly improved, he came to Melbourne as lecturer on history at the university. Soon afterwards he became head master of the Presbyterian Ladies' College, and in this position practically organized the whole system of higher education for women in Victoria. On his election in 1878 to the Legislative Assembly he definitely adopted politics as his career. His views on the land question and secular education aroused the bitter hostility of the rich squatters and the clergy; but his singular nobility of character, no less than his powers of mind, made him one of the most influential men in the Assembly. He was minister without portfolio in the Berry cabinet (1880–1881), and as minister of education in the coalition government of 1886 to 1890 he was able to pass into law many of the recommendations of his report. His reforms entirely remodelled state education in Victoria. In 1892 a fresh attack of illness decided him to return to England. Here he published in 1893 the best known of his works, *National Life and Character*. It is an attempt to show that the white man can flourish only in the temperate zones, that the yellow and black races must increase out of all proportion to the white, and must in time crush out his civilization. He died in London on the 29th of May 1894.

A volume of his *Reviews and Critical Essays* was published in 1896, and was followed in 1900 by his autobiography, a work of great interest.

PEARSON, JOHN (1612–1686), English divine and scholar, was born at Great Snoring, Norfolk, on the 28th of February 1612. From Eton he passed to Queen's College, Cambridge, and was elected a scholar of King's in April 1632, and a fellow in 1634. On taking orders in 1639 he was collated to the Salisbury prebend of Nether-Avon. In 1640 he was appointed chaplain to the lord-keeper Finch, by whom he was presented to the living of Thorington in Suffolk. In the Civil War he acted as chaplain to George Goring's forces in the west. In 1654 he was made weekly preacher at St Clement's, Eastcheap, in London. With Peter Gunning he disputed against two Roman Catholics on the subject of schism, a one-sided account of which was printed in Paris by one of the Roman Catholic disputants, under the title *Scisme Unmask't* (1658). Pearson also argued against the Puritan party, and was much interested in Brian Walton's polyglot Bible. In 1659 he published in London his celebrated *Exposition of the Creed*, dedicated to his parishioners of St Clement's, Eastcheap, to whom the substance of the work had been preached several years before. In the same year he published the *Golden Remains of the ever-memorable Mr John Hales of Eton*, with an interesting memoir. Soon after the Restoration he was presented by Juxon, bishop of London, to the rectory of St Christopher-le-Stocks; and in 1660 he was created doctor of divinity at Cambridge, appointed a royal chaplain, prebendary of Ely, archdeacon of Surrey, and master of Jesus College, Cambridge. In 1661 he was appointed Lady Margaret professor of divinity; and on the first day of the ensuing year he was nominated one of the commissioners for the review of the liturgy in the conference held at the Savoy. There he won the esteem of his opponents and high praise from Richard Baxter. On the 14th of April 1662 he was made master of Trinity College, Cambridge. In 1667 he was admitted a fellow of the Royal Society. In 1672 he published at Cambridge *Vindiciae epistolarum S. Ignatii*, in 4to, in answer to Jean Daillé. His defence of the authenticity of the letters of Ignatius has been confirmed by J. B. Lightfoot and other recent scholars. Upon the death of John Wilkins in 1672, Pearson was appointed to the bishopric of Chester. In 1682 his *Annales cyprianici* were published at Oxford, with John Fell's edition of that father's works. He died at Chester on the 16th of July 1686. His last work, the *Two Dissertations on the Succession and Times of the First Bishops of Rome*, formed with the *Annales Paulini* the principal part of his *Opera posthuma*, edited by Henry Dodwell in 1688.

See the memoir in *Biographia Britannica*, and another by Edward Churton, prefixed to the edition of Pearson's *Minor Theological Works* (2 vols., Oxford, 1844). Churton also edited almost the whole of the theological writings.

PEARSON, JOHN LOUGHBOROUGH (1817–1897), English architect, son of William Pearson, etcher, of Durham, was born in Brussels on the 5th of July 1817. He was articled at the age of fourteen to Ignatius Bonomi, architect, of Durham, but soon removed to London, and worked under the elder Hardwicke. He revived and practised largely the art of vaulting, and acquired in it a proficiency unrivalled in his generation. He was, however, by no means a Gothic purist, and was also fond of Renaissance and thoroughly grounded in classical architecture. From the erection of his first church of Ellerker, in Yorkshire, in 1843, to that of St Peter's, Vauxhall, in 1864, his buildings are Geometrical in manner and exhibit a close adherence to precedent, but elegance of proportion and refinement of detail lift them out of the commonplace of mere imitation. Holy Trinity, Westminster (1848), and St Mary's, Dalton Holme (1858), are notable examples of this phase. St Peter's, Vauxhall (1864), his first groined church, was also the first of a series of buildings which brought Pearson to the forefront among his contemporaries. In these he applied the Early English style to modern needs and modern economy with unrivalled success. St Augustine's, Kilburn (1871), St John's, Red Lion Square, London (1874), St Alban's, Birmingham (1880), St Michael's, Croydon (1880), St John's, Norwood (1881), St Stephen's, Bournemouth (1889), and All Saints', Hove (1889), are characteristic examples of his matured work. He is best known by Truro Cathedral (1880), which has a special interest in its apt incorporation of the south aisle of the ancient church. Pearson's conservative spirit fitted him for the reparation of ancient edifices, and among cathedrals and other historical buildings placed under his care were Lincoln, Chichester, Peterborough, Bristol and Exeter Cathedrals, St George's Chapel, Windsor, Westminster Hall and Westminster Abbey, in the surveyorship of which last he succeeded Sir G. G. Scott. Except as to the porches, the work of Scott, he re-faced the north transept of Westminster Abbey, and also designed the vigorous organ cases. In his handling of ancient buildings he was repeatedly opposed by the ultra anti-restorers (as in the case of the west front of Peterborough Cathedral in 1896), but he generally proved the soundness of his judgment by his executed work. Pearson's practice was not confined to church building. Treberfydd House (1850), Quar Wood (1858), Lechlade Manor, an Elizabethan house (1873), Westwood House, Sydenham, in the French Renaissance style (1880), the Astor estate offices (1892) upon the Victoria

Embankment, London, the remodelling of the interiors of Clieveden House (1893) and No. 18 Carlton House Terrace (1894), with many parsonages, show his aptitude for domestic architecture. In general design he first aimed at form, embracing both proportion and contour; and his work may be recognized by accurate scholarship coupled with harmonious detail. Its key-notes are cautiousness and refinement rather than boldness. He died on the 11th of December 1897, and was buried in the nave of Westminster Abbey, where his grave is marked by the appropriate motto *Sustinuit et abstinuit*. He was elected A.R.A. in 1874, R.A. in 1880, was a fellow of the Society of Antiquaries, and a fellow and member of the Council of the Royal Institute of British Architects.

The following are some of Pearson's more important works, not already named: Ferriby church (1846); Stow, Lincolnshire (restoration, 1850); Weybridge, St James's (1853); Freeland church, parsonage and schools (1866); Kilburn, St Peter's Home (1868); Wentworth church (1872); Horsforth church (1874); Cullercoats, St George's (1882); Chiswick, St Michael's (restoration, 1882); Great Yarmouth church (restoration, 1883); Liverpool, St Agnes' (1883); Woking Convalescent Home (1884); Headingley church (1884); Torquay, All Saints (1884); Maidstone, All Saints (restoration, 1885); Shrewsbury Abbey (1886); Ayr, Holy Trinity (1886); Hythe church (restoration, 1887); Oxford, New College, reredos (completion, 1889); Cambridge University Library (additions, 1889); Friern Barnet, St John's (1890); Cambridge, Sidney Sussex College (additions, 1890); Middlesex Hospital chapel (1890); Bishopsgate, St Helen's (restoration, 1891); Maida Hill (Irvingite) church (1891); Barking, All Hallows (restoration, 1893); Cambridge, Emmanuel College (additions, 1893); Ledbury, St Michael's (restoration, 1894); Malta, Memorial church (1894); Port Talbot church (1895).
(W. D. C.)

PEARY, ROBERT EDWIN (1856–), American Arctic explorer, was born at Cresson, Pennsylvania, on the 6th of May 1856. He graduated at Bowdoin College in 1877, and in 1881 became a civil engineer in the U.S. navy with the rank of lieutenant. In 1884 he was appointed assistant-engineer in connexion with the surveys for the Nicaragua Ship Canal, and in 1887–1888 he was in charge of these surveys. In 1886 he obtained leave of absence for a summer excursion to Disco Bay on the west coast of Greenland. From this point he made a journey of nearly a hundred miles into the interior, and the experience impressed him with the practicability of using this so-called inland ice-cap as a highway for exploration. In 1891 he organized an expedition under the auspices of the Academy of Natural Sciences of Philadelphia. The party of seven included Lieut. Peary's wife, the first white woman to accompany an Arctic expedition. After wintering in Inglefield Gulf on the north-west coast of Greenland, in the following spring Lieut. Peary, with a young Norwegian, Eivind Astrup, crossed the inland ice-cap along its northern limit to the north-east of Greenland and back. The practical geographical result of this journey was to establish the insularity of Greenland. Valuable work was also performed by the expedition in the close study which was made of the isolated tribe of the Cape York or Smith Sound Eskimos, the most northerly people in the world.[1] Lieut. Peary was able to fit out another Arctic expedition in 1893, and was again accompanied by Mrs Peary, who gave birth to a daughter at the winter quarters in Inglefield Gulf. The expedition returned in the season of 1894, leaving Peary with his coloured servant Henson and Mr Hugh G. Lee to renew the attempt to cross the inland ice in the next year. This they succeeded in doing, but without being able to carry the work of exploration any farther on the opposite side of Greenland. During a summer excursion to Melville Bay in 1894, Peary discovered three large meteorites, which supplied the Eskimos with the material for their iron implements, as reported by Sir John Ross in 1818, and on his return in 1895 he brought the two smaller ones with him. The remaining meteorite was brought to New York in 1897. In 1898 Lieut. Peary published *Northward over the Great Ice*, a record of all his expeditions up to that time, and in the same year he started on another expedition to the Arctic regions. In this and subsequent expeditions he received financial aid from Mr Morris Jesup and the Peary Arctic Club. The greatest forethought was bestowed upon the organization of the expedition, a four-years' programme being laid down at the outset and a system of relief expeditions provided for. A distinctive feature was the utilization of a company of Eskimos. Although unsuccessful as regards the North Pole, the expedition achieved the accurate survey (1900) of the northern limit of the Greenland continent and the demonstration that beyond it lay a Polar ocean. In 1902 Peary with Henson and an Eskimo advanced as far north as lat. 84° 17′ 27″, the highest point then reached in the western hemisphere. Lieut. Peary had now been promoted to the rank of Commander, and on his return he was elected president of the American Geographical Society. In November 1903 he went to England on a naval commission to inquire into the system of naval barracks in Great Britain, and was presented with the Livingstone Gold Medal of the Royal Scottish Geographical Society. Commander Peary then began preparations for another expedition by the construction of a special ship, named the "Roosevelt," the first ever built in the United States for the purpose of Arctic exploration. He sailed from New York on the 16th of July 1905, having two years' supplies on board. The "Roosevelt" wintered on the north coast of Grant Land, and on the 21st of February a start was made with sledges. The party experienced serious delay owing to open water between 84° and 85°, and farther north the ice was opened up during a six days' gale, which cut off communications and destroyed the dépôts which had been established. A steady easterly drift was experienced. But on the 21st of April 1906, 87° 6′ was reached—the "farthest north" attained by man—by which time Peary and his companions were suffering severe privations, and had to make the return journey in the face of great difficulties. They reached the north coast of Greenland and subsequently rejoined the ship, from which, after a week's rest, Peary made a sledge journey along the north coast of Grant Land. Returning home, the expedition reached Hebron, Labrador, on the 13th of October, the "Roosevelt" having been nearly wrecked *en route*. In 1907 the narrative of this journey, *Nearest the Pole*, was published.

In 1908 Peary started in the "Roosevelt" on the journey which was to bring him his final success. He left Etah on the 18th of August, wintered in Grant Land, and set forward over the ice from Cape Columbia on the 1st of March 1909. A party of six started with him, and moved in sections, one in front of another. They were gradually sent back as supplies diminished. At the end of the month Captain Bartlett was the only white man left with Peary, and he turned back in 87° 48′ N., the highest latitude then ever reached. Peary, with his negro servant and four Eskimos, pushed on, and on the 6th of April 1909 reached the North Pole. They remained some thirty hours, took observations, and on sounding, a few miles from the pole, found no bottom at 1500 fathoms. The return was made in the face of no little difficulty, but the party, with the exception of one drowned, came safely to the "Roosevelt," which left her winter quarters on the 18th of July and reached Indian Harbour on the 5th of September.

Just before the news came of Peary's success another American explorer, Dr F. A. Cook (b. 1865), returning from Greenland to Europe on a Danish ship, claimed that he had reached the North Pole on the 21st of April 1908. He had accompanied an expedition northward in 1907, prepared to attempt to reach the Pole if opportunity offered, and according to his own story had done so, leaving his party and taking only some Eskimos, early in 1908. Nothing had been heard of him since March of that year, and it was supposed that he had perished. Cook's claim to have forestalled Peary was at first credited in various circles, and he was given a rapturous reception at Copenhagen; but scientific opinion in England and America was more reserved, and eventually, after a prolonged dispute, a special committee of the university of Copenhagen, to whom his documents were submitted, declared that they

[1] A narrative of the expedition written by Mrs Peary, and containing an account of the "Great White Journey across Greenland," by her husband, was published under the title of *My Arctic Journal*.

contained no proof that he had reached the Pole. By that time most other people had come to an adverse conclusion and the sensation was over.

PEASANT (O. Fr. *paysant*, Mod. *paysan*; Lat. *pagensis*, belonging to the *pagus* or country; cf. "pagan"), a countryman or rustic, either working for others, or, more specifically, owning or renting and working by his own labour a small plot of ground. Though a word of not very strict application, it is now frequently used of the rural population of such countries as France, where the land is chiefly held by small holders, "peasant proprietors." (See ALLOTMENTS and METAYAGE.)

PEASE, EDWARD (1767–1858), the founder of a famous industrial Quaker family in the north of England, was born at Darlington on the 31st of May 1767, his father, Joseph Pease (1737–1808), being a woollen manufacturer in that town. Having retired from this business Edward Pease made the acquaintance of George Stephenson, and with him took a prominent part in constructing the railway between Stockton and Darlington. He died at Darlington on the 31st of July 1858. His second son, Joseph Pease (1799–1872), who assisted his father in his railway enterprises, was M.P. for South Durham from 1832 to 1841, being the first Quaker to sit in parliament. He was interested in collieries, quarries and ironstone mines in Durham and North Yorkshire, as well as in cotton and woollen manufactures; and he was active in educational and philanthropic work. Another son, Henry Pease (1807–1881), was M.P. for South Durham from 1857 to 1865. Like all the members of his family he was a supporter of the Peace Society, and in its interests he visited the emperor Nicholas of Russia just before the outbreak of the Crimean War, and later the emperor of the French, Napoleon III.

Joseph Pease's eldest son, Sir Joseph Whitwell Pease (1828–1903), was made a baronet in 1882. He was M.P. for South Durham from 1865 to 1885 and for the Barnard Castle division of Durham from 1885 to 1903. His elder son, Sir Alfred Edward Pease (b. 1857), who succeeded to the baronetcy, became famous as a hunter of big game, and was M.P. for York from 1885 to 1892 and for the Cleveland division of Yorkshire from 1897 to 1902. A younger son, Joseph Albert Pease (b. 1860), entered parliament in 1892, and in 1908 became chief Liberal whip, being advanced to the cabinet as chancellor of the duchy of Lancaster in 1910.

Another son of Joseph Pease was Arthur Pease (1837–1898), member of parliament from 1880 to 1885 and again from 1895 to 1898. His son, Herbert Pike Pease (b. 1867), M.P. for Darlington 1898–1910, was one of the Unionist Whips.

The Diaries of Edward Pease were edited by Sir Alfred Pease in 1907.

PEAT (possibly connected with Med. Lat. *petia*, *pecia*, piece, ultimately of Celtic origin; cf. O. Celt. *pet*, O. Ir. *pit*, Welsh *peth*, portion), a product of decayed vegetation found in the form of bogs in many parts of the world. The continent of Europe is estimated to contain 212,700 sq. m. of bog; Ireland has 2,858,150 acres, Canada 30,000,000 acres, and the United States 20,000,000 acres. The plants which give origin to these deposits are mainly aquatic, including reeds, rushes, sedges and mosses. *Sphagnum* is present in most peats, but in Irish peat *Thacomitrum lanuginosum* predominates. It seems that the disintegration of the vegetable tissues is effected partly by moist atmospheric oxidation and partly by anaerobic bacteria, yeasts, moulds and fungi, in depressions containing fairly still but not stagnant water, which is retained by an impervious bed or underlying strata. As decomposition proceeds the products become waterlogged and sink to the bottom of the pool; in the course of time the deposits attain a considerable thickness, and the lower layers, under the superincumbent pressure of the water and later deposits, are gradually compressed and carbonized. The most favourable conditions appear to be a moist atmosphere, and a mean annual temperature of about 45° F.; no bogs are found between latitudes 45° N. and 45° S.

Peat varies from a pale yellow or brown fibrous substance, resembling turf or compressed hay, containing conspicuous plant remains, to a compact dark brown material, resembling black clay when wet, and some varieties of lignite when dry. Two typical forms may be noticed: "Hill peat" (the mountain or brown bogs of Ireland), found in mountainous districts, and consisting mainly of *Sphagnum* and *Andromeda*; and "Bottom peat" (the lowland or red bogs of Ireland), found in lakes, rivers, and brooks, and containing *Hypnum*. It always contains much water, up to 90 %, which it is necessary to remove before the product can be efficiently employed as a fuel, and for most other purposes. A specimen dried at 100° C. had the composition: carbon = 60·48 %, hydrogen = 6·10 %, oxygen = 32·55 %, nitrogen = 0·88 %, ash = 3·30 %; the ash is very variable—from 1 to 65 %—and consists principally of clay and sand, with lesser amounts of ferric oxide, lime, magnesia, &c. The specific gravity has been variously given, owing to the variable water content and air spaces; when dried and compressed, however, it is denser than water.

Peat-winning presents certain special features. The general practice is to cut a trench about a foot deep with a peculiarly shaped spade, termed in Ireland a "slane," and remove sods from 3 to 4 ft. long. When one layer has been removed, the next is attacked, and so on. If the deposit be more solid step-working may be adopted, and should water be reached recourse may be had to long-handled slanes. The sods are allowed to drain, and then stacked for drying in the air, being occasionally turned so as to dry equally; this process may require about six weeks. The dried sods are known as "dug peat." Excavators and dredges are now extensively used, and the drying is effected in heated chambers, both fixed and revolving.

The low value of ordinary dug peat as a fuel has led to processes for obtaining a more useful product. In M. Ekenberg's process the wet peat is pulped and milled so as to make it of uniform composition, and the pulp passed into an oven maintained at 180°–200° F., where it is carbonized by superheated water. The pressed product, which resembles lignite, still contains 8 to 14 % of water; this is driven off by heat, and the residue briquetted. The final product is nearly equal to coal in calorific value, and has the additional advantage of a lower sulphur content—0·2 to 0·4 % against about 2 % in ordinary coal. M. Zeigler's method leads to the production of a useful coke. Both these processes permit the recovery of valuable by-products, especially ammonium sulphate. Experiments for obtaining a gas suitable for consumption in gas-engines have been followed by commercial processes devised by the Mond Gas Corporation, London, and Crossley Bros. of Manchester, and by Caro and Frank in Germany. The processes essentially consist in destructively distilling peat in special retorts and under specified conditions, and, in addition to the gas, there is recovered a useful coke and also the nitrogen as ammonium sulphate.

The conversion of the nitrogen into ammonia has been the subject of much work, and is commercially pursued at a works at Carnlough, Co. Antrim, under patents held by H. C. Woltereck. The peat is treated with a mixture of air and water vapour in special furnaces, and the gaseous products, including paraffin tar, acetic acid and ammonia, are led through a special scrubber to remove the tar, then through a tower containing milk of lime to absorb the acid (the calcium acetate formed being employed for the manufacture of acetone, &c.), and finally through a sulphuric acid tower, where the ammonia is converted into ammonium sulphate which is recovered by crystallization.

Peat has also been exploited as a source of commercial alcohol, to be employed in motors. In the process founded on the experiments of R. W. Wallace and Sir W. Ramsay, which gives 25 to 26 gallons of spirit from a ton of peat, the peat is boiled with water containing a little sulphuric acid, the product neutralized with lime and then distilled; the ammonia is also recovered. In another process a yield of 40 gallons of spirit and 66 ℔ of ammonium sulphate per ton of peat is claimed.

Of other applications we may notice C. E. Nelson's process for making a paper, said to be better than ordinary wrapping; the first factory to exploit this idea was opened at Capac, Michigan, in 1906. Peat has been employed as a manure for many years, and recently attempts have been made to convert artificially its nitrogen into assimilable nitrates; such a process was patented by A. Müntz and A. G. Girard of Paris, in 1907.

See P. R. Björling and F. T. Gissing, *Peat and its Manufacture* (1907); F. T. Gissing, *Commercial Peat* (1909); E. Nystrom, *Peat and Lignite* (1908), published by Department of Mines of Canada.

PÉCAUT, FELIX (1828–1898), French educationist, a member of an old Huguenot family, was born at Salies de Béarn in 1828. He was for some months evangelical pastor at Salies, but he had no pretence of sympathy with ecclesiastical authority.

He was consequently compelled to resign his pastorate, and for some years occupied himself by urging the claims of a liberal Christianity. In 1879 he conducted a general inspection of primary education for the French government, and several similar missions followed. His fame chiefly rests in his successful organization of the training school for women teachers at Fontenoy-aux-Roses, to which he devoted fifteen years of ceaseless toil. He died on the 31st of July 1898.

A summary of his educational views is given in his *Public Education and National Life* (1897).

PECCARY, the name of the New World representatives of the swine (*Suidae*) of the E. hemisphere, of which they constitute the sub-family *Dicotylinae* (or *Tagassuinae*). (See ARTIODACTYLA and SWINE.)

The teeth of the peccaries differ from those of the typical Old World pigs (*Sus*), numerically, in wanting the upper outer incisor and the anterior premolar on each side of each jaw, the dental formula being: i. $\frac{2}{3}$, c. $\frac{1}{1}$, p. $\frac{3}{3}$, m. $\frac{3}{3}$, total 38. From those of all Old World swine or *Suinae*, the upper canines, or tusks, differ in having their points directed downwards, not outwards or

The Collared Peccary (*Dicotyles tajacu*).

upwards; these being very sharp, with cutting hinder edges, and completely covered with enamel until worn. The lower canines are large and directed upwards and outwards, and slightly curved backwards. The cheek-teeth form a continuous series, gradually increasing in size from the first to the last: the molars having square four-cusped crowns. The stomach is much more complex than in the true pigs, almost approaching that of a ruminant. In the feet the two middle (third and fourth) metacarpal and metatarsal bones, which are completely separate in the pigs, are united at their upper ends. On the fore-foot the two (second and fifth) outer toes are equally developed as in pigs, but on the hind-foot, although the inner (or second) is present, the outer or fifth toe is entirely wanting. As in all *Suidae* the snout is truncated, and the nostrils are situated in its flat, expanded, disk-like termination. The ears are rather small, ovate and erect; and there is no external appearance of a tail.

Peccaries, which range from New Mexico and Texas to Patagonia, are represented by two main types, of which the first is the collared peccary, *Dicotyles* (or *Tagassu*) *tajacu*, which has an extensive range in South America. Generally it is found singly or in pairs, or at most in small herds of from eight to ten, and is not inclined to attack other animals or human beings. Its colour is dark grey, with a white or whitish band passing across the chest from shoulder to shoulder. The length of the head and body is about 36 in. The second form is typified by the white-lipped peccary or warri, *D.* (or *T.*) *labiatus*, or *pecari*, representing the sub-genus *Olidosus*. Typically it is rather larger than the collared species, being about 40 in. in length, of a blackish colour, with the lips and lower jaw white. It is not found farther north than Guatemala, or south of Paraguay. Generally met with in large droves of from fifty to a hundred, it is of a more pugnacious disposition than the former species, and a hunter who encounters a herd in a forest has often to climb a tree as his only chance of safety. Peccaries are omnivorous, living on roots, fallen fruits, worms and carrion, and often inflict great devastation upon crops. Both types are so nearly allied that they will breed together freely in captivity. Unlike pigs, they never appear to produce more than two young ones at a birth.

Remains of extinct peccaries referable to the modern genus occur in the caverns and superficial deposits of South America, but not in the earlier formations. This, coupled with the occurrence of earlier types in North America, indicates that the group is a northern one. Of the extinct North American peccaries, the typical *Dicotyles* occur in the Pliocene while the Miocene *Bothriolabis*, which has tusks of the peccary type, approximates in the structure of its cheek-teeth to the European Miocene genus among the *Suinae*. From this it may be inferred that the ancestral peccaries entered America in the Upper Oligocene. *Platygonus* is an aberrant type which died out in the Pleistocene. (R. L.*)

PECHLIN, KARL FREDRIK (1720–1796), Swedish politician and demagogue, son of the Holstein minister at Stockholm, was educated in Sweden, and entered the Swedish army. He rose to the rank of major-general, but became famous by being the type *par excellence* of the corrupt and egoistic Swedish parliamentarian of the final period of the Frihetstiden (see SWEDEN: *History*); he received for many years the sobriquet of "General of the Riksdag." Pechlin first appears prominently in Swedish politics in 1760, when by suddenly changing sides he contrived to save the "Hats" from impeachment. Enraged at being thus excluded from power by their former friend, the "Caps" procured Pechlin's expulsion from the two following Riksdags. In 1769 Pechlin sold the "Hats" as he had formerly sold the "Caps," and was largely instrumental in preventing the projected indispensable reform of the Swedish constitution. During the revolution of 1772 he escaped from Stockholm and kept quietly in the background. In 1786, when the opposition against Gustavus III. was gathering strength, Pechlin reappeared in the Riksdag as one of the leaders of the malcontents, and is said to have been at the same time in the pay of the Russian court. In 1789 he was one of the deputies whom Gustavus III. kept under lock and key till he had changed the government into a semi-absolute monarchy. It is fairly certain that Pechlin was at the bottom of the plot for murdering Gustavus in 1792. On the eve of the assassination (March 16) the principal conspirators met at his house to make their final preparations and discuss the form of government which should be adopted after the king's death. Pechlin undertook to crowd the fatal masquerade with accomplices, but took care not to be there personally. He was arrested on the 17th of March, but nothing definite could ever be proved against him. Nevertheless he was condemned to imprisonment in the fortress of Varberg, where he died four years later.

See R. N. Bain, *Gustavus III. and his Contemporaries* (London, 1905). (R. N. B.)

PECHORA, a river of N. Russia, rising in the Urals, almost on 62° N., in the government of Perm. It flows W. for a short distance, then turns N. and maintains that direction up to about 66° 20′ N. It then describes a double loop, to N. and to S., and after that resumes its N. course, finally emptying into the Gulf of Pechora, situated between the White Sea and the Kara Sea. Its total length is 970 m. At its mouth it forms an elongated delta. Although frozen in its upper reaches for 190 days in the year and for 138 days in its lower reaches, it is navigable throughout the greater part of its course. Its drainage basin covers an area of 127,200 sq. m. The principal tributaries are, on the right, the Ilych and the Usa, and on the left the Izhma, the Tsylma and the Sula.

PECK, a dry measure of capacity, especially used for grain. It contains 8 quarts or 2 gallons, and is ¼ of a bushel. The

imperial peck contains 554·548 cub. in., in the United States of America 537·6 cub. in. The word is in M.E. *pck*, and is found latinized as *peccum* or *pekka*. In Med. Lat. are found *picotinus*, "mensura frumentaria," and *picotus*, "mensura liquidorum" (Du Cange, *Gloss. s.vv.*) These words seem to be connected with the Fr. *picoter*, to peck, of a bird, and this would identify the word with "peck," a variant of "pick," a tap or stroke of the beak, especially used of the action of a bird in picking up grain or other food. The sense-development in this case is very obscure, and the name of the measure is found much earlier than "peck" as a variant form of "pick."

PECKHAM, JOHN (d. 1292), archbishop of Canterbury, was probably a native of Sussex, and received his early education from the Cluniac monks of Lewes. About 1250 he joined the Franciscan order and studied in their Oxford convent. Shortly afterwards he proceeded to the university of Paris, where he took his degree under St Bonaventure and became regent in theology. For many years Peckham taught at Paris, coming into contact with the greatest scholars of the day, among others St Thomas Aquinas. About 1270 he returned to Oxford and taught there, being elected in 1275 provincial minister of the Franciscans in England, but he was soon afterwards called to Rome as *lector sacri palatii*, or theological lecturer in the schools of the papal palace. In 1279 he returned to England as archbishop of Canterbury, being appointed by the pope on the rejection of Robert Burnell, Edward I.'s candidate. Peckham was always a strenuous advocate of the papal power, especially as shown in the Council of Lyons in 1274. His enthronement in October 1279 marks the beginning of an important epoch in the history of the English primacy. Its characteristic note was an insistence on discipline which offended contemporaries. Peckham's zeal was not tempered by discernment, and he had little gift of sympathy or imagination. His first act on arrival in England was to call a council at Reading, which met in July 1279. Its main object was ecclesiastical reform, but the provision that a copy of Magna Carta should be hung in all cathedral and collegiate churches seemed to the king a political action, and parliament declared void any action of this council touching on the royal power. Nevertheless Peckham's relations with the king were often cordial, and Edward called on him for help in bringing order into conquered Wales. The chief note of his activity was, however, certainly ecclesiastical. The crime of "plurality," the holding by one cleric of two or more benefices, was especially attacked, as also clerical absenteeism and ignorance, and laxity in the monastic life. Peckham's main instrument was a minute system of "visitation," which he used with a frequency hitherto unknown. Disputes resulted, and on some points Peckham gave way, but his powers as papal legate complicated matters, and he did much to strengthen the court of Canterbury at the expense of the lower courts. The famous quarrel with St Thomas of Cantilupe, bishop of Hereford, arose out of similar causes. A more attractive side of Peckham's career is his activity as a writer. The numerous manuscripts of his works to be found in the libraries of Italy, England and France, testify to his industry as a philosopher and commentator. In philosophy he represents the Franciscan school which attacked the teaching of St Thomas Aquinas on the "Unity of Form." He wrote in a quaint and elaborate style on scientific, scriptural and moral subjects and engaged in much controversy in defence of the Franciscan rule and practice. He was "an excellent maker of songs," and his hymns are characterized by a lyrical tenderness which seems typically Franciscan. Printed examples of his work as commentator and hymn writer respectively may be found in the *Firamentum trium ordinum* (Paris, 1512), and his office for Trinity Sunday in the "unreformed" breviary.

The chief authority on Peckham as archbishop of Canterbury, is the *Registrum fratris Johannis Peckham*, edited by C. Trice Martin for the Rolls Series (London, 1882–1885). A sympathetic account of his life as a Franciscan is to be found in L. Wadding, *Annales minorum* (Lyons, 1625, 1654). See also the article by C. L. Kingsford in *Dict. Nat. Biog.*, and Wilkin's *Concilia magnae Britanniae* (London, 1737). (E. O'N.)

PECOCK (or **PEACOCK**), **REGINALD** (*c.* 1395–*c.* 1460), English prelate and writer, was probably born in Wales, and was educated at Oriel College, Oxford. Having been ordained priest in 1421, he secured a mastership in London in 1431, and soon became prominent by his attacks upon the religious position of the Lollards. In 1444 he became bishop of St Asaph, and six years later bishop of Chichester. He was an adherent of the house of Lancaster and in 1454 became a member of the privy council. In attacking the Lollards Pecock put forward religious views far in advance of his age. He asserted that the Scriptures were not the only standard of right and wrong; he questioned some of the articles of the creed and the infallibility of the Church; he wished "bi cleer witte drawe men into consente of trewe feith otherwise than bi fire and swerd or hangement" and in general he exalted the authority of reason. Owing to these views the archbishop of Canterbury, Thomas Bourchier, ordered his writings to be examined. This was done and he was found guilty of heresy. He was removed from the privy council and he only saved himself from a painful death by privately, and then publicly (at St Paul's Cross, Dec. 4, 1457), renouncing his opinions. Pecock, who has been called "the only great English theologian of the 15th century," was then forced to resign his bishopric, and was removed to Thorney Abbey in Cambridgeshire, where he doubtless remained until his death. The bishop's chief work is the famous *Repressor of over-much weeting* [blaming] *of the Clergie*, which was issued about 1455. In addition to its great importance in the history of the Lollard movement the *Repressor* has an exceptional interest as a model of the English of the time, Pecock being one of the first writers to use the vernacular. In thought and style alike it is the work of a man of learning and ability.

A biography of the author is added to the edition of the *Repressor* published by C. Babington for the Rolls Series in 1860. Pecock's other writings include the *Book or Rule of Christian Religion*; the *Donet*, "an introduction to the chief truths of the Christian faith in the form of a dialogue between father and son"; and the *Folewer to the Donet*. The two last works are extant in manuscript. His *Book of Faith* has been edited from the manuscript in the library of Trinity College, Cambridge, by J. L. Morison (Glasgow, 1909). See also John Lewis, *Life of Pecock* (1744; new ed., 1820).

PECORA (plural of Lat. *pecus*, cattle), a term employed—in a more restricted sense—in place of the older title Ruminantia, to designate the group of ruminating artiodactyle ungulates represented by oxen, sheep, goats, antelopes, deer, giraffes, &c.

The leading characteristics of the Pecora are given in some detail in the article ARTIODACTYLA (*q.v.*); but it is necessary to allude to a few of these here. Pecora, or true ruminants as they may be conveniently called, have complex stomachs and chew the cud; they have no upper incisor teeth; and the lower canines are approximated to the outer incisors in such a manner that the three incisors and the one canine of the two sides collectively form a continuous semicircle of four pairs of nearly similar teeth. In the cheek-teeth the component columns are crescent-shaped, constituting the selenodont type. In the fore-limbs the bones corresponding to the third and fourth metacarpals of the pig's foot are fused into a cannon-bone; and a similar condition obtains in the case of the corresponding metatarsals in the hind-limbs. There is generally no sagittal crest to the skull; and the condyle of the lower jaw is transversely elongated. Another general, although not universal, characteristic of the Pecora is the presence of simple or complex appendages on the forehead commonly known as horns. In a few existing species, such as the musk-deer and the water-deer, these appendages are absent, and they are likewise lacking in a large number of extinct members of the group, in fact in all the earlier ones. They are, therefore, a specialized feature, which has only recently attained its full development.

These horns present several distinct structural types, which may be classified as follows:—

I. The simplest type is that of the giraffe, in which three bony prominences—a single one in front and a pair behind—quite separate from the underlying bones and covered during life with skin, occupy the front surface of the skull. The summits of the hind pair are surmounted by bristly hairs. In the extinct

Sivatherium there are two pairs of such appendages, of which the hinder are large and were probably covered during life either with skin or thin horn. In the giraffes the separation of the horns from the skull may be a degenerate character.

II. In the Asiatic muntjac deer we find a pair of skin-covered horns, or "pedicles," corresponding to the paired horns of the giraffe, although welded to the skull. From the summits of these

FIG. 1.—Head of Siamese Deer (*Cervus schomburghii*), showing antlers.

pedicles arise secondary outgrowths, at first covered with skin, which (owing to the growth of a ring of bone at the base arresting the flow of blood) eventually dries up and leaves bare bone incapable of further growth. In the muntjac the bare bony part, or "antler," is small in proportion to the skin-covered pedicle, and simple in structure; but in the majority of deer the antler increases in size at the expense of the pedicle—which dwindles—and in some species, like the Siamese deer (fig. 1), the sambar and the red deer, becomes very large and more or less branched. Owing to liability to necrosis, the permanent retention of such a mass of dead bone would be dangerous; and the antlers are consequently shed annually (or every few years), to be renewed the following year, when, till the animal becomes past its prime, they are larger than their predecessors. The periodical shedding is also necessary in order to allow of this increase in size. With the exception of the reindeer, antlers are confined to the males.

III. The third type of horn is presented by the American prongbuck, or pronghorn, in which bony processes, or "cores," corresponding to the horns of the giraffe, have acquired a horny sheath, in place of skin; the sheath being in this instance forked, and annually shed and renewed, although the core is simple. The sheaths are akin to hair in structure, thus suggesting affinity with the hairs surmounting the giraffe's horns. Female prongbuck may or may not have horns.

IV. In the great majority of "Hollow-horned Ruminants," such as oxen, sheep, goats and antelopes (fig. 2), the horny sheath (or true "horn") forms a simple unbranched cone, which may be compressed, spirally twisted, or curved in one or more directions, but is permanently retained and continues to grow throughout life from the base, while it becomes worn away at the tip. Rarely, as in the four-horned antelope, there are two pairs of horns. In many cases these horns are present in both sexes.

Dr H. Gadow is of opinion that the antlers of the deer, the horn-like protuberances on the skull of the giraffe, and the true horns of the prongbuck and other hollow-horned ruminants (*Bovidae*) are all different stages of evolution from a single common type: the antlers of the deer being the most primitive, and the horns of the *Bovidae* the most specialized. From the fact that the bony horn-core of the hollow-horned ruminants first develops as a separate ossification, as do the horns of the giraffe, while the pedicle of the antlers of the deer grow direct from the frontal bone, it has been proposed to place the hollow-horned ruminants (inclusive of the prongbuck) and the giraffes in one group and the deer in another. This arrangement has the disadvantage of separating the deer from the giraffes, to which they are evidently nearly related; but D Gadow's work brings them more into line. Whether he is righ in regarding the hollow-horned ruminants as derived from th primitive deer may, however, be a matter of opinion. One ver important fact recorded by Dr Gadow is that calves and lamb shed their horns at an early age. The *Bovidae* are thus brough into nearer relationship with the American prongbuck (the onl living ruminant which sheds its horn-cover in the adult condition than has generally been supposed.

The above-mentioned four types of skull appendages are gener ally regarded as severally characteristic of as many family groups namely the *Giraffidae*, *Cervidae*, *Antilocapridae* and *Bovidae*. Th two last are, however, much more closely connected than are eithe of the others, and should perhaps be united.

Giraffidae.—In the *Giraffidae*, which include not only giraffe (*Giraffa*) but also the okapi (*Ocapia*) and a number of extinc species from the Lower Pliocene Tertiary deposits of souther Europe, Asia and North Africa, the appendages on the skull are o type No. I., and may well be designated "antler-horns." Anothe important feature is that the lower canine has a cleft or two-lobe crown, so that it is unlike the incisors to which it is approximated There are no upper canines; and the cheek-teeth are short-crowne (brachyodont) with a peculiar grained enamel, resembling th skin of a slug in character. The feet have only two hoofs, all trace of the small lateral pair found in many other ruminants havin disappeared.

The giraffes (*Giraffa*) are now an exclusively African genus, an have long legs and neck, and three horns—a single one in fron and a pair behind—supplemented in some instances with a rud mentary pair on the occiput.

The okapi (*Ocapia*), which is also African but restricted to th tropical forest-region, in place of being an inhabitant of more o less open country, represents a second genus, characterized by th shorter neck and limbs, the totally different type of colouring, an the restriction of the horns to the male sex, in which they for a pair on the forehead; these horns being more compressed tha

FIG. 2.—Head of Grant's Gazelle (*Gazella granti*), showing horns.

the paired horns of the giraffe, and penetrating the skin at thei summits (see GIRAFFE and OKAPI). Remains of extinct specie of giraffe occur in the Lower Pliocene formations of Greece, Hungary Persia, Northern India and China. From deposits of the sam age in Greece, Samos and elsewhere have been obtained skull and other remains of *Palaeotragus* or *Samotherium*, a ruminan closely allied to *Ocapia*, the males of which were armed with a ver similar pair of dagger-shaped horns. *Helladotherium* was a muc larger animal, known by a single hornless skull from the Pliocen of Greece, which may be that of a female. In the equally larg

Bramatherium and *Hydaspitherium* of India the horns of the males were complex, those of the former including an occipital pair, while those of the latter arise from a common base. In both genera, as in the okapi, there is a vacuity in front of the orbit. Largest of all is *Sivatherium*, typically from the Lower Pliocene of Northern India, but also recorded from Adrianople, in which the skull of the male is short and wide, with a pair of simple conical horns above the eye, and a huge branching pair at the vertex. *Libytherium* is an allied form from North Africa. Whether the *Giraffidae* were originally an African or a Euro-Asiatic group there is not yet sufficient evidence to decide. The family is unrepresented in the western hemisphere.

Cervidae.—In the deer-tribe, or *Cervidae*, the lower canine, as in the two following families, is simple and similar to the incisors. The frontal appendages, when present, are confined (except in the case of the reindeer) to the males, and take the form of antlers, that is to say of type No. II. in the foregoing description. As a general rule, the molars, and more especially the first, are partially brachyodont (short-crowned); although they are taller in the chital (*Cervus axis*). In the skull there are two orifices to the lachrymal duct, situated on or inside the rim of the orbit. A preorbital vacuity of such dimensions as to exclude the lachrymal bone from articulation with the nasal. Upper canines usually present in both sexes, and sometimes attaining a very great size in the male (see fig. 3).

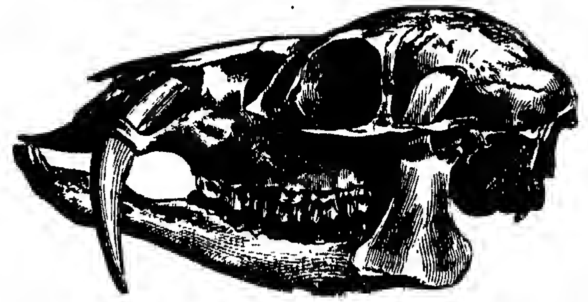

Fig. 3.—Skull of Chinese Water-Deer, *Hydrelaphus inermis* (adult male), a Deer without Antlers, but with largely developed upper canine teeth. (× ½.)

Lateral digits of both fore and hind feet almost always present, and frequently the lower ends of the metacarpals and the metatarsals as well. Placenta with few cotyledons. Gall-bladder absent (except in the musk-deer, *Moschus*). This family contains numerous species, having a wide geographical distribution, ranging in the New World from the Arctic circle as far south as Patagonia, and in the Old World throughout the whole of Europe and Asia, but absent in Africa south of the Sahara, and, of course, Australasia. Evidently the family originated in the northern continent of the Old World, from which an entrance was effected by way of Bering Strait into America. Some of the more northern American deer, such as the wapiti, reindeer and elk (moose), are closely allied to Old World species; but there is also a group of exclusively American deer (*Mazama*)—the only one found in Central and South America —the members of which are unlike any living Old World deer; and these must be regarded as having reached the western hemisphere at an earlier date than the wapiti, reindeer and elk (see Deer, Elk, Fallow-Deer, Muntjac, Musk-Deer, Père David's Deer, Reindeer, Roebuck, Water-Deer, &c.).

Remains of deer more or less nearly allied to species inhabiting the same districts are found over the greater part of the present habitat of the family. It is noteworthy, however, that certain Pliocene European deer (*Anoglochis*) appear to be closely allied to the modern American deer (*Mazama*). As we descend in the geological series the deer have simpler antlers, as in the European Miocene *Dicroceras*; while in the Oligocene *Amphitragulus*, *Dremotherium* and *Palaeomeryx*, constituting the family *Palaeomerycidae*, antlers were absent, and the crowns of the molars so low that the whole depth of the hollows between the crescentic columns is completely visible. Most of these animals were of small size, and many had long upper canines, like those of the existing *Hydrelaphus*; while in all there was no depression for a gland in front of the eye.

From North America have been obtained remains of certain ruminants which seem in some degree intermediate between deer and the prongbuck. Of one of these a complete skeleton was obtained in 1901 from the Middle Miocene deposits of north-eastern Colorado, and as mounted stands 19 in. in height at the withers. With the exception that the right antler is malformed and partially aborted, and that the bones of the lateral toes have been lost, the skeleton is practically complete. The one complete antler has a well-marked burr and a long undivided beam, which eventually forks. After this there is a bifurcation of the hinder branch, thus producing three tines. From the presence of these well-marked antlers the skeleton would at first sight be set down as that of a small and primitive deer, conforming in regard to the structure of these appendages to the American type of the group. Mr W. D. Matthew shows, however, that the skeleton of *Merycodus*, as the extinct ruminant is called, differs markedly from that of all deer. The most noteworthy point of distinction is in the skull, in which the facial portion is sharply bent down on the posterior basal axis in the fashion characteristic of the hollow-horned ruminants (oxen, antelopes, &c.), and the American prongbuck, instead of running more or less nearly parallel to the same, as in deer. Again, the cheek-teeth have the tall crowns characteristic of a large number of representatives of the first group and of the prongbuck, thereby showing that *Merycodus* can scarcely be regarded as a primitive type. As regards the general structure of the rest of the skeleton, it must suffice to say that this agrees closely with that of the antelopes and the prongbuck, and differs markedly from the cervine type. In the absence of any trace of the lower extremities of the metacarpal and metatarsal bones of the lateral toes the skeleton differs from the American deer, and resembles those hollow-horned ruminants in which these toes persist.

As a whole *Merycodus* presents a curious mixture of cervine and antilopine character. To explain these, two alternatives are offered by the describer. Either we must regard *Merycodus* as a deer which parallels the antelopes and the prongbuck in every detail of skeletal structure, or else, like the prongbuck, an antelope separated from the main stock at a date sufficiently early to have permitted the development of a distinct type of cranial appendages, namely, antlers in place of true horns. The former alternative, it is urged, involves a parallelism too close and too uniform between unrelated types to have been probable. On the latter view *Merycodus*, the prongbuck (*Antilocapra*) and the antelopes must be regarded as representing three branches from an original common stock, divergent as regards the structure of their cranial appendages, but parallel in other respects. If, therefore, *Antilocapra* deserves to be separated as a family from the *Bovidae*, the same can scarcely be refused for *Merycodus*. But American extinct types appear to indicate signs of intimate relationship between antelopes, prongbuck and deer, and it may be necessary eventually to amend the current classification. As a temporary measure it seems preferable to regard *Merycodus* either as representing a distinct subfamily of *Antilocapridae* or a family by itself, the latter course being adopted by Mr Matthew.

Whatever be the ultimate verdict, the association of antlers—and these, be it noticed, conforming almost exactly with the forked type characteristic of American deer—with an antilopine type of skull, skeleton and teeth in *Merycodus* is a most interesting and unexpected feature. *Merycodus* was named many years ago by Professor J. Leidy on the evidence of imperfect materials, and other remains now known to belong to the same type were subsequently described as *Cosoryx*, to which *Blastomeryx* seems to be allied. Not till the discovery of the skeleton of the species described by Mr Matthew was it possible to arrive at an adequate conception of the affinities of this remarkable ruminant.

Antilocapridae.—By many modern writers the American prongbuck, pronghorn or "antelope," alone forming the genus *Antilocapra*, is regarded as representing merely a sub-family of the *Bovidae*, to which latter group the animal is structurally akin. In view of what has been stated in the preceding paragraph with regard to the extinct American genus *Merycodus*, it seems, however, at least provisionally advisable to allow the prongbuck to remain as the type of a family—*Antilocapridae*. The characteristic of this family —as represented by the prongbuck—is that the sheath of the horns is forked, and shed annually, or every few years. The cheek-teeth are tall-crowned (hypsodont), and lateral hoofs are wanting (see Prongbuck).

Bovidae.—Lastly, we have the great family of hollow-horned ruminants or *Bovidae*, in which the horns (present in the males at least of all the existing species) take the form of simple non-deciduous hollow sheaths growing upon bony cores. As a rule the molars are tall-crowned (hypsodont). Usually only one orifice to the lachrymal canal, situated inside the rim of the orbit. Lachrymal bone almost always articulating with the nasal. Canines absent in both sexes. The lateral toes may be completely absent, but more often are represented by the hoofs alone, supported sometimes by a very rudimentary skeleton, consisting of mere irregular nodules of bone. Lower ends of the lateral metacarpals and metatarsals never present. Gall-bladder almost always present. Placenta with many cotyledons.

The *Bovidae* form a most extensive family, with members widely distributed throughout the Old World, with the exception of the Australian region; but in America they are less numerous, and confined to the Arctic and northern temperate regions, no species being indigenous either to South or Central America. The home of the family was evidently the Old World, whence a small number of forms made their way into North America by way of what is now Bering Strait. It has already been pointed out that the *Cervidae* originated in the northern continent of the Old World; and it has been suggested that the *Bovidae* were developed in Africa. Unfortunately, we know at present practically nothing as to the past history of the group, all the fossil species at present discovered approximating more or less closely to existing types. While admitting, therefore, that there are several facts in favour of the theory of an African origin of the *Bovidae*, final judgment

must for the present be suspended. For the various generic types see BOVIDAE, and the special articles referred to under that heading. (R. L.*)

PÉCS (Ger. *Fünfkirchen*), a town of Hungary, capital of the county of Baranya, 160 m. S.S.W. of Budapest by rail. Pop. (1900), 42,252. It lies on the outskirts of the Mecsek Hills, and is composed of the inner old town, which is laid out in an almost regular square, and four suburbs. Pécs is the see of a Roman Catholic bishop, and its cathedral, reputed one of the oldest churches in Hungary, is also one of the finest medieval buildings in the country. It was built in the 11th century in the Romanesque style with four towers, and completely restored in 1881–1891. In the Cathedral Square is situated the *Sacellum*, a subterranean brick structure, probably a burial-chapel, dating from the end of the 4th or the beginning of the 5th century. Other noteworthy buildings are the parish church, formerly a mosque of the Turkish period; the hospital church, also a former mosque, with a minaret 88 ft. high, and another mosque, the bishop's palace, and the town and county hall. Pécs has manufactories of woollens, porcelain, leather and paper, and carries on a considerable trade in tobacco, gall-nuts and wine. The hills around the town are covered with vineyards, which produce one of the best wines in Hungary. In the vicinity are valuable coal-mines, which since 1858 are worked by the Danube Steamship Company.

According to tradition Pécs existed in the time of the Romans under the name of *Sompiana*, and several remains of the Roman and early Christian period have been found here. In the Frankish-German period it was known under the name of *Quinque ecclesiae*; its bishopric was founded in 1009. King Ludwig I. founded here in 1367 a university, which existed until the battle of Mohács. In 1543 it was taken by the Turks, who retained possession of it till 1686.

PECTORAL, a word applied to various objects worn on the breast (Lat. *pectus*); thus it is the name of the ornamental plate of metal or embroidery formerly worn by bishops of the Roman Church during the celebration of mass, the breastplate of the Jewish high priest, and the metal plate placed on the breast of the embalmed dead in Egyptian tombs. The "pectoral cross," a small cross of precious metal, is worn by bishops and abbots of the Roman, and by bishops of the Anglican, communion. The term has also been used for the more general "poitrel" or "peitrel" (the French and Norman French forms respectively), the piece of armour which protected the breast of the war-horse of the middle ages.

PECULIAR, a word now generally used in the sense of that which solely or exclusively belongs to, or is particularly characteristic of, an individual; hence strange, odd, queer. The Lat. *peculiaris* meant primarily "belonging to private property," and is formed from *peculium*, private property, particularly the property given by a *paterfamilias* to his children, or by a master to his slave, to enjoy as their own. As a term of ecclesiastical law "peculiar" is applied to those ecclesiastical districts, parishes, chapels or churches, once numerous in England, which were outside the jurisdiction of the bishop of the diocese in which they were situated, and were subject to a jurisdiction "peculiar" to themselves. They were introduced originally, in many cases by papal authority, in order to limit the powers of the bishop in his diocese. There were royal peculiars, *e.g.* the Chapel Royal St James's, or St George's Windsor, peculiars of the archbishop, over certain of which the Court of Peculiars exercised jurisdiction (see ARCHES, COURT OF), and peculiars of bishops and deans (see DEAN). The jurisdiction and privileges of the "peculiars" were abolished by statutory powers given to the Ecclesiastical Commissioners, by the Ecclesiastical Commissioners Acts 1836 and 1850, by the Pluralities Act 1838, the Ecclesiastical Jurisdiction Act 1847, and other statutes.

PECULIAR PEOPLE, a small sect of Christian faith-healers founded in London in 1838 by John Banyard. They consider themselves bound by the literal interpretation of James v. 14, and in cases of sickness seek no medical aid but rely on oil, prayer and nursing. The community is in the main composed of simple working people, who, apart from their peculiarity have a good reputation; but their avoidance of professiona medical attendance has led to severe criticism at inquests or children who have died for want of it.

PEDAGOGUE, a teacher or schoolmaster, a term usually now applied with a certain amount of contempt, implying pedantry dogmatism or narrow-mindedness. The Gr. παιδαγωγός (παῖς boy, ἀγωγός, leader, ἄγειν, to lead), from which the English word is derived, was not strictly an instructor. He was a slave in an Athenian household who looked after the persona safety of the sons of the master of the house, kept them from bad company, and took them to and from school and the gymnasium. He probably sat with his charges in school. The boys were put in his charge at the age of six. The παιδαγωγός being a slave, was necessarily a foreigner, usually a Thracian or Asiatic. The Romans adopted the *paedagogus* or *pedagogus* towards the end of the republic. He probably took some part in the instruction of the boys (see SCHOOLS). Under the empire the *pedagogus* was specifically the instructor of the boy slaves who were being trained and educated in the household of the emperor and of the rich nobles and other persons; these boys lived together in a *paedagogium*, and were known as *pueri paedagogiani*, a name which has possibly developed into "page" (*q.v.*).

PEDAL CLARINET, a contrabass instrument invented in 1891 by M. F. Besson to complete the quartet of clarinets, as the contrafagotto or double bassoon completes that of the oboe family; it is constructed on practically the same principles as the clarinet, and consists of a tube 10 ft. long, in which cylindrical and conical bores are so ingeniously combined that the acoustic principles remain unchanged. The tube is doubled up twice upon itself; at the upper end the beak mouthpiece stands out like the head of a viper, while at the lower a metal tube, in the shape of a U with a wide gloxinea-shaped bell, is joined to the wooden tube. The beak mouthpiece is exactly like that of the other clarinets but of larger size, and it is furnished with a single or beating reed. There are 13 keys and 2 rings on the tube, and the fingering is the same as for the B flat clarinet except for the eight highest semitones. The compass of the pedal clarinet is as follows:—

The instrument is in B flat two octaves below the B flat clarinet, and, like it, it is a transposing instrument, the music being written in a key a tone higher than that of the composition, and in order to avoid ledger lines a whole octave higher besides. The tone is rich and full except for the lowest notes, which are unavoidably a little rough in quality, but much more sonorous than the corresponding notes on the double bassoon. The upper register resembles the chalumeau register of the B flat clarinet, being reedy and sweet. The instrument is used as a fundamental bass for the wood wind at Kneller Hall, and it has also been used at Covent Garden to accompany the music of Fafner and Hunding in the *Nibelungen Ring*.

Many attempts have been made since the beginning of the 19th century to construct contra clarinets, but all possessed inherent faults and have been discarded (see BATYPHONE). A contrabass clarinet in F, an octave below the basset horn, constructed by Albert of Brussels in 1890, was, we believe, considered successful but it differed in design from the pedal clarinet. (K. S.)

PEDANT, one who exaggerates the value of detailed erudition for its own sake; also a person who delights in a display of the exact niceties of learning, in an excessive obedience to theory without regard to practical uses. The word came into English in the latter part of the 16th century in the sense of schoolmaster the original meaning of Ital. *pedante*, from which it is derived The word is usually taken to be an adaptation of Gr. παιδεύειν

to teach. Others connect with an O. Ital. *pedare*, to tramp about (Lat. *pes*, foot), of an usher tramping about with his pupils.

PEDEN, ALEXANDER (*c.* 1626–1686), Scottish divine, one of the leading forces in the Covenant movement, was born at Auchincloich, Ayrshire, about 1626, and was educated at Glasgow University. He was ordained minister of New Luce in Galloway in 1660, but had to leave his parish under Middleton's Ejectment Act in 1663. For 23 years he wandered far and wide, bringing comfort and succour to his co-religionists, and often very narrowly escaping capture. He was indeed taken in June 1673 while holding a conventicle at Knockdow, and condemned by the privy council to 4 years and 3 months' imprisonment on the Bass Rock and a further 15 months in the Tolbooth at Edinburgh. In December 1678 he was, with sixty others, sentenced to banishment to the American plantations, but the party was liberated in London, and Peden made his way north again to divide the remaining years of his life between his own country and the north of Ireland. His last days were spent in a cave in the parish of Sorn, near his birthplace, and there he died in 1686, worn out by hardship and privation.

See A. Smellie, *Men of the Covenant*, ch. xxxiv.

PEDERSEN, CHRISTIERN (*c.* 1480–1554), Danish writer, known as the "father of Danish literature," was a canon of the cathedral of Lund, and in 1510 went to Paris, where he took his master's degree in 1515. In Paris he edited the proverbs of Peder Laale and (1514) the *Historia danica* of Saxo Grammaticus. He showed signs of the spirit of reform, asserting that the gospels should be translated into the vernacular so that the common people might understand. He worked at a continuation of the history of Saxo Grammaticus, and became secretary to Christian II., whom he followed into exile in 1525. In Holland he translated the New Testament (1529) and the Psalms (1531) from the Vulgate, and, becoming a convert to the reformed opinion, he issued several Lutheran tracts. After his return to Denmark in 1532 he set up a printing press at Malmö. He published a Danish version (*Krönike om Holger Danske*) of the French romance of Ogier the Dane, and another of the Charlemagne legends, which is probably derived immediately from the Norwegian *Karlamagnus saga*. His greatest work, the Danish version of the Holy Scriptures, which is known generally as "Christian III.'s Bible," is an important landmark in Danish literature. It was founded on Luther's version, and was edited by Peder Palladius, bishop of Zealand, and others.

See C. Pedersen's *Danske Skrifter*, edited by C. J. Brandt and R. T. Fenger (5 vols., Copenhagen, 1850–1856).

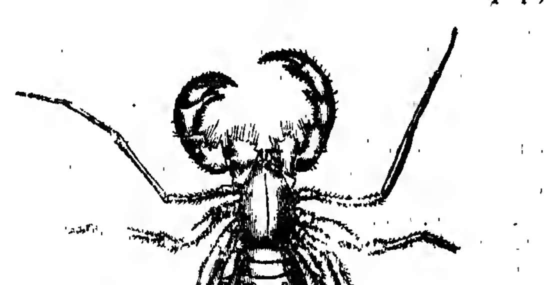
PEDESTAL (Fr. *piedestal*, Ital. *piedestallo*, foot of a stall), a term generally applied to a support, square, octagonal or circular on plan, provided to carry a statue or a vase. Although in Syria, Asia Minor and Tunisia the Romans occasionally raised the columns of their temples or propylaea on square pedestals, in Rome itself they were employed only to give greater importance to isolated columns, such as those of Trajan and Antoninus, or as a *podium* to the columns employed decoratively in the Roman triumphal arches. The architects of the Italian revival, however, conceived the idea that no order was complete without a pedestal, and as the orders were by them employed to divide up and decorate a building in several storeys, the cornice of the pedestal was carried through and formed the sills of their windows, or, in open arcades, round a court, the balustrade of the arcade. They also would seem to have considered that the height of the pedestal should correspond in its proportion with that of the column of pilaster it supported; thus in the church of St John Lateran, where the applied order is of considerable dimensions, the pedestal is 13 ft. high instead of the ordinary height of 3 to 5 ft.

PEDICULOSIS, or PHTHIRIASIS, the medical term for the pathological symptoms in man due to the presence of lice (*pediculi*), either on the head (*pediculus capitis*), body (*pediculus corporis*, or *vestimentorum*), or pubes (*pediculus pubis*).

PEDIGREE, a genealogical tree, a tabular statement of descent (see GENEALOGY). The word first appears at the beginning of the 15th century and takes an extraordinary variety of forms, *e.g. pedicree, pe de gre, petiegrew, pelygru*, &c. It is generally accepted that these point to a corruption of Fr. *pied de grue*, foot of a crane, and that the probable reference is to the marks resembling the claw of a bird found in old genealogies showing the lines of descent. Such etymologies as Minshea's *par degrés*, by degrees, or *père degrés*, descent by the father, are mere guesses.

PEDIMENT (equivalents, Gr. ἀετός, Lat. *fastigium*, Fr. *fronton*), in classic architecture the triangular-shaped portion of the wall above the cornice which formed the termination of the roof behind it. The projecting mouldings of the cornice which surround it enclose the tympanum, which is sometimes decorated with sculpture. The pediment in classic architecture corresponds to the gable in Gothic architecture, where the roof is of loftier pitch. It was employed by the Greeks only as the front of the roof which covered the main building; the Romans, however, adopted it as a decorative termination to a doorway, niche or window, and occasionally, in a row of windows or niches, alternated the triangular with a segmental pediment. It was reserved for the Italian architects of the decadence to break the pediment in the centre, thus destroying its original purpose. The earliest English form of the word is *periment* or *peremint*, probably a workman's corruption of "pyramid."

PEDIPALPI, Arachnida (*q.v.*) related to the spiders, and serving in a measure to bridge over the structural interval between the latter and the scorpions. The appendages of the second pair are large and prehensile, as in scorpions, but are armed with spines, to impale and hold prey. The appendages of the third pair, representing the first pair of walking legs in spiders and scorpions, are, on the contrary, long, attenuated and many-jointed at the end. Like the antennae of insects, they act as feelers. It is from this structural feature that the term "pedipalpi" has been derived. In the tailless division of the Pedipalpi,



Mexican tailed Pedipalp (*Mastigoproctus giganteus*).

namely the Amblypygi of which *Phrynus* is a commonly cited type, these tactile appendages are exceedingly long and lash-like, whereas in the tailed division, the Uropygi, of which *Thelyphonus* is best known, the limb is much shorter and less modified. *Thelyphonus* and its allies, however, have a long tactile caudal flagellum, the homologue of the scorpion's sting; but its exact use is unknown. A third division, the Tartarides, a subordinate group of the Uropygi, contains minute Arachnida differing principally from the typical Uropygi in having the caudal process unjointed and short. Apart from the Tartarides, the Pedipalpi

are large or medium-sized Arachnida, nocturnal in habits and spending the day under stones, logs of wood or loosened bark. Some species of the Uropygi (Thelyphonidae) dig burrows; and in the east there is a family of Amblypygi, the Charontidae, of which many of the species live in the recesses of deep caves. Specimens of another species have been found under stones between tide marks in the Andaman Islands. The Pedipalpi feed upon insects, and like spiders, are oviparous. The eggs after being laid are carried about by the mother, adhering in a glutinous mass to the underside of the abdomen.

Pedipalpi date back to the Carboniferous Period, occurring in deposits of that age both in Europe and North America. Moreover, the two main divisions of the order, which were as sharply differentiated then as they are now, have existed practically unchanged from that remote epoch.

In spite of the untold ages they have been in existence, the Pedipalpi are more restricted in range than the scorpions. The Uropygi are found only in Central and South America and in south and eastern Asia, from India and South China to the Solomon Islands. The absence of the entire order from Africa is an interesting fact. The distribution of the Amblypygi practically covers that of the Uropygi, but in addition they extend from India through Arabia into tropical and southern Africa. Both groups are unknown in Madagascar, in Australia, with the exception possibly of the extreme north, and in New Zealand. Very little can be said with certainty about the distribution of the Tartarides. They have been recorded from the Indian Region, West Africa and sub-tropical America. (R. I. P.)

PEDOMETER (Lat. *pes*, foot, and Gr. *μέτρον*, measure), an apparatus in the form of a watch, which, carried on the person of a walker, counts the number of paces he makes, and thus indicates approximately the distance travelled. The ordinary form has a dial-plate marked for yards and miles. The registration is effected by the fall of a heavy pendulum, caused by the percussion of each step. The pendulum is forced back to a horizontal position by a delicate spring, and with each stroke a fine-toothed ratchet-wheel connected with it is moved round a certain length. The ratchet communicates with a train of wheels which work the dial-hands. In using the apparatus a measured mile or other known distance is walked and the indication thereby made on the dial-plate observed. According as it is too great or too small, the stroke of the pendulum is shortened or lengthened by a screw. Obviously the pedometer is little better than an ingenious toy, depending even for rough measurements on the uniformity of pace maintained throughout the journey measured.

PEDRO II. (1825–1891), emperor of Brazil, came to the throne in childhood, having been born on the 2nd of December 1825, and proclaimed emperor in April 1831, upon the abdication of his father. He was declared of full age in 1840. For a long period few thrones appeared more secure, and his prosperous and beneficent rule might have endured throughout his life but for his want of energy and inattention to the signs of the times. The rising generation had become honeycombed with republicanism, the prospects of the imperial succession were justly regarded as unsatisfactory, the higher classes had been estranged by the emancipation of the slaves, and all these causes of discontent found expression in a military revolt, which in November 1889 overthrew the seemingly solid edifice of the Brazilian Empire in a few hours. Dom Pedro retired to Europe, and died in Paris on the 5th of December 1891. The chief events of his reign had been the emancipation of the slaves, and the war with Paraguay in 1864–70. Dom Pedro was a model constitutional sovereign, and a munificent patron of science and letters. He travelled in the United States (1876), and thrice visited Europe (1871–1872, 1876–1877, 1886–1889).

PEEBLES, a royal and police burgh and county town of Peeblesshire, Scotland, situated at the junction of Eddleston Water with the Tweed. Pop. (1901), 5266. It is 27 m. south of Edinburgh by the North British railway (22 m. by road), and is also the terminus of a branch line of the Caledonian system from Carstairs in Lanarkshire. The burgh consists of the new town, the principal quarter, on the south of the Eddleston, and the old on the north; the Tweed is crossed by a handsome five-arched bridge. Peebles is a noted haunt of anglers, and the Royal Company of Archers shoot here periodically for the silver arrow given by the burgh. The chief public buildings are the town and county halls, the corn exchange, the hospital and Chambers Institution. The last was once the town house of the earls of March, but was presented to Peebles by William Chambers, the publisher, in 1859. The site of the castle, which stood till the beginning of the 18th century, is now occupied by the parish church, built in 1887. Of St Andrew's church, founded in 1195, nothing remains but the tower, restored by William Chambers, who was buried beside it in 1883. The church of the Holy Rood was erected by Alexander III. in 1261, to contain a supposed remnant of the true cross discovered here. The building remained till 1784, when it was nearly demolished to provide stones for a new parish church. Portions of the town walls still exist, and there are also vaulted cellars constructed in the 16th and 17th centuries as hiding-places against Border freebooters. The old cross, which had stood for several years in the quadrangle of Chambers Institution, was restored and erected in High Street in 1895. The industries consist of the manufactures of woollens and tweeds, and of meal and flour mills. The town is also an important agricultural centre.

The name of Peebles is said to be derived from the *pebylls*, or tents, which the Gadeni pitched here in the days of the Romans. The place was early a favourite residence of the Scots kings when they came to hunt in Ettrick forest. It probably received its charter from Alexander III., was created a royal burgh in 1367 and was the scene of the poem of *Peblis to the Play*, ascribed to James I. In 1544 the town sustained heavy damage in the expedition led by the 1st earl of Hertford, afterwards the protector Somerset, and in 1604 a large portion of it was destroyed by fire. Though James VI. extended its charter, Peebles lost its importance after the union of the Crowns.

On the north bank of the Tweed, one mile west of Peebles, stands Neidpath Castle. The ancient peel tower dates probably from the 13th century. Its first owners were Tweeddale Frasers or Frisels, from whom it passed, by marriage, to the Hays of Yester in Haddingtonshire, earls of Tweeddale. It was besieged and taken by Cromwell in 1650. The third earl of Tweeddale (1645–1713) sold it to the duke of Queensberry in 1686. The earl of Wemyss succeeded to the Neidpath property in 1810.

PEEBLESSHIRE, or TWEEDDALE, a southern inland county of Scotland, bounded N. and N.E. by Edinburghshire, E. and S.E. by Selkirkshire, S. by Dumfriesshire, and W. by Lanarkshire. Its area is 222,599 acres or 547·8 sq. m. The surface consists of a succession of hills, which are highest in the south, broken by the vale of the Tweed and the glens formed by its numerous tributaries. South of the Tweed the highest points are Broad Law and Cramalt Craig on the confines of Selkirkshire (each 2723 ft.), while north of the river are, in the west centre, Broughton Heights (1872), Trahenna Hill (1792), Penvalla (1764) and Ladyurd Hill (1724), and in the north-west the Pentland eminences of Mount Maw (1753), Byrehope Mount (1752) and King Seat (1521). The lowest point above sea-level is on the banks of the Tweed, where it passes into Selkirkshire (about 450 ft.). The principal river is the Tweed, and from the fact that for the first 36 m. of its course of 97 m. it flows through the south of the shire, the county derives its alternative name of Tweeddale. Its affluents on the right are the Stanhope, Drummelzier, Manor and Quair; on the left, the Biggar, Lyne, Eddlestone and Leithen. The North Esk, rising in Cairnmuir, forms the boundary line between Midlothian and Peeblesshire for about four miles, during which it presents some very charming pictures, especially at Habbie's Howe, where Allan Ramsay laid the scene of the *Gentle Shepherd*. For 4 m. of its course the South Medwin divides the south-western part of the parish of Linton from Lanarkshire. Portmore Loch, a small sheet of water 2 m. north-east of Eddlestone church, lies at a height of 1000 ft. above the sea, and is the only lake in the county. The shire is in favour with anglers, its streams being well stocked and unpolluted, and few restrictions being placed on the fishing.

Geology.—The southern elevated portion of the county is occupied by Silurian rocks, mainly by shales and grits or greywackes of Llandovery age. Owing to the repeated folding and crumpling of the rocks in this region there are numerous elliptical exposures of Ordovician strata within the Silurian tract; but the principal area of Ordovician rocks lies north of a line running south-west from the Moorfoot Hills through Lyne and Stobo. Here these rocks form a belt some four to five miles in breadth; they are composed of radiolarian cherts and mudstones with associated contemporaneous volcanic rocks of Arenig age, and of shales, grits and limestones of Llandeilo and Caradoc age. The general direction of strike of all these formations is south-west to north-east, but the dips are sometimes misleading through occasional inversion of the strata. Patches of higher Silurian, with Wenlock and Ludlow fossils, are found in the north of the country in the Pentland Hills, and resting conformably upon the Silurian in the same district is the Lower Old Red Sandstone. The Old Red Sandstone here consists of a lower division, red and chocolate marls and sandstones; a middle division, volcanic rocks, porphyrites, tuffs, &c., which are unconformable on the lower marls in this area; and an upper division, sandstones and conglomerates. The south-west extremity of the Edinburgh coalfield just enters this county over the north-west border where a slice of Carboniferous strata is found let down between Silurian and Old Red rocks by two important faults. Both Calciferous sandstone and Carboniferous limestone occur, with useful beds of coal, limestone, ironstone, fireclay and alum shale. An outlier of Carboniferous limestone, surrounded by Lower Old Red Sandstone, lies south of Linton. Much glacial boulder clay with gravel and sand rests upon the higher ground, while morainic deposits are found in the valleys.

Climate and Industries.—The annual rainfall averages from 33 to 41 in.; the mean temperature for the year is 47·5° F., for January 38° F., and for July 59° F. The character of the soil varies considerably, peat, gravel and clay being all represented. The low-lying lands consist generally of rich loam, composed of sand and clay. The farming is pastoral rather than arable. The average holding is about 200 acres of arable land, with pasturage for from 600 to 800 sheep. Roughly speaking, one-fifth of the total area is under cultivation. Oats are the chief grain and turnips the chief root crop. The hill pastures are better suited to sheep than to cattle, but both flocks and herds are comparatively large. Cheviots and half-breds are preferred for the grass lands, the heathery ranges being stocked with black-faced sheep. Crosses of Cheviots, black-faced and half-bred ewes with Leicestershire rams are common. The favourite breed of cattle is a cross between Ayrshires and shorthorns, the cows being Ayrshire. Many of the horses are Clydesdales bred in the county. Pig-keeping is on the decline. A few acres have been laid down as nurseries and market gardens, and about 10,000 acres are under wood, especially at Dalwick, where larch and horse-chestnut were first grown in Scotland. Apart from agriculture, the only industries are the woollen factories and flour mills at Peebles and Innerleithen.

The North British railway crosses the county in the north from Leadburn to Dolphinton, and runs down the Eddlestone valley from Leadburn to Peebles and Thornielee, while in the south the Caledonian railway connects the county town with Biggar in Lanarkshire.

Population and Administration.—In 1901 the population numbered 15,066 or 43 persons to the sq. m. In 1901 one person spoke Gaelic only, 72 Gaelic and English. The chief towns are Peebles (pop. 5266) and Innerleithen (2181). West Linton, on Lyne Water, is a holiday resort. The shire combines with Selkirkshire to return one member to parliament, the electors of Peebles town voting with the county. Peeblesshire forms a sheriffdom with the Lothians and a sheriff-substitute sits in the county town. There is a high school in Peebles, and one or more schools in the county usually earn grants for secondary education.

History.—The country was originally occupied by the Gadeni, a British tribe, of whom there are many remains in the shape of camps and sepulchral mounds (in which stone coffins, axes and hammers have been found), while several place-names (such as Peebles, Dalwick and Stobo) also attest their presence. The standing stones near the confluence of the Lyne and Tweed are supposed to commemorate a Cymric chief. The natives were reduced by the Romans, who have left traces of their military rule in the fine camp at Lyne, locally known as Randal's Walls. The hill-side terraces at Romanno are conjectured, somewhat fancifully, to be remains of a Roman method of cultivation. On the retreat of the Romans the Gadeni came into their own again, and although they are said to have been defeated by King Arthur at Cademuir in 530, they held the district until the consolidation of the kingdom after Malcolm II.'s victory at Carham in 1018, before which the land, constantly harried by Danes, was nominally included in the territory of Northumbria. This tract of Scotland is closely associated with the legend of Merlin. David I. made the district a deanery in the archdeaconry of Peebles, and it afterwards formed part of the diocese of Glasgow. Towards the middle of the 12th century it was placed under the jurisdiction of two sheriffs, one of whom was settled at Traquair and the other at Peebles. At Happrew, in the valley of the Lyne, the English defeated Wallace in 1304. The Scottish sovereigns had a lodge at Polmood, and often hunted in the uplands and the adjoining forests. English armies occasionally invaded the county, but more frequently the people were harried by Border raiders. Many castles and peels were erected in the valley of the Tweed from the Bield to Berwick. Several were renowned in their day, among them Oliver Castle (built by Sir Oliver Fraser in the reign of David I.), Drumelzier, Tinnis or Thane's Castle, and Neidpath. Three miles south of Romanno stand the ruins of Drochil Castle, designed for the Regent Morton, who was beheaded at Edinburgh in 1581, and the building was never completed. Memories of the Covenanters cluster around Tweedhopefoot, Tweedshaws, Corehead, Tweedsmuir, Talla Linns and other spots. In the churchyard of Tweedsmuir is the tombstone of John Hunter, the martyr, which was relettered by "Old Mortality." The "men of the moss hags" did little fighting in Peeblesshire, but Montrose first drew rein at Traquair House after he was defeated at Philiphaugh on the Yarrow in 1645. The plain of Sheriffmuir near Lyne is the place where the Tweeddale wapinschaws used to be held in the 17th century. The Jacobite risings left the county untouched, and since the beginning of the 19th century the shire has been more conspicuous in literature than in politics.

PEEKSKILL, a village of Westchester county, New York, U.S.A., on the E. bank of the Hudson River, about 41 m. N. of New York City. Pop. (1910, census), 15,245. It is served by the New York Central & Hudson River railway, and by passenger and freight steamboat lines on the Hudson River. The village is the home of many New York business men. At Peekskill are the Peekskill military academy (1833; non-sectarian); St Mary's school, Mount St Gabriel (Protestant Episcopal), a school for girls established by the sisterhood of St Mary; the Field memorial library; St Joseph's home (Roman Catholic); the Peekskill hospital, and several sanatoria. Near the village is the state military camp, where the national guard of the state meets in annual encampment. Peekskill has many manufactures, and the factory products were valued in 1905 at $7,251,897, an increase of 306·7 % since 1900. The site was settled early in the 18th century, but the village itself dates from about 1760, when it took its present name from the adjacent creek or "kill," on which a Dutch trader, Jans Peek, of New York City, had established a trading post. During the latter part of the War of Independence Peekskill was an important outpost of the Continental Army, and in the neighbourhood several small engagements were fought between American and British scouting parties. The village was incorporated in 1816. Peekskill was the country home of Henry Ward Beecher.

PEEL, ARTHUR WELLESLEY PEEL, 1st VISCOUNT (1829–), English statesman, youngest son of the great Sir Robert Peel, was born on the 3rd of August 1829, and was educated at Eton and Balliol College, Oxford. He unsuccessfully

contested Coventry in 1863; in 1865 he was elected in the Liberal interest for Warwick, for which he sat until his elevation to the peerage. In December 1868 he was appointed parliamentary secretary to the poor law board. This office he filled until 1871, when he became secretary to the board of trade, an appointment which he held for two years. In 1873–1874 he was patronage secretary to the treasury, and in 1880 he became under-secretary for the home department. On the retirement of Mr Brand (afterwards Viscount Hampden) in 1884, Peel was elected Speaker. He was thrice re-elected to the post, twice in 1886, and again in 1892. Throughout his career as Speaker he exhibited conspicuous impartiality, combined with a perfect knowledge of the traditions, usages and forms of the house, soundness of judgment, and readiness of decision upon all occasions; and he will always rank as one of the greatest holders of this important office. On the 8th of April 1895 he announced that for reasons of health he was compelled to retire. The farewell ceremony was of a most impressive character, and warm tributes were paid from all parts of the house. He was created a viscount and granted a pension of £4000 for life. He was presented with the freedom of the City of London in July 1895. The public interest in the ex-Speaker's later life centred entirely in his somewhat controversial connexion with the drink traffic. A royal commission was appointed in April 1896 to inquire into the operation and administration of the licensing laws, and Viscount Peel was appointed chairman. In July 1898 Lord Peel drew up a draft report for discussion, in five parts. Some differences of opinion arose in connexion with the report, and at a meeting of the commissioners on the 12th of April 1899, when part 5 of the draft report was to be considered, a proposal was made to substitute an alternative draft for Lord Peel's, and also a series of alternative drafts for the four sections already discussed. Lord Peel declined to put these proposals, and left the room. Sir Algernon West was elected to the chair, and ultimately two main reports were presented, one section agreeing with Lord Peel, and the other—including the majority of the commissioners—presenting a report which differed from his in several important respects. The Peel report recommended that a large reduction in the number of licensed houses should be immediately effected, and that no compensation should be paid from the public rates or taxes, the money for this purpose being raised by an annual licence-rental levied on the rateable value of the licensed premises; it at once became a valuable weapon in the hands of advanced reformers.

Lord Peel married in 1862, and had four sons and two daughters (married to Mr J. Rochfort Maguire and to Mr C. S. Goldman). His eldest son, William Robert Wellesley Peel (b. 1866), married the daughter of Lord Ashton; he was Unionist M.P. for South Manchester from 1900 to 1906, and later for Taunton, and also acted as Municipal Reform leader on the London County Council.

PEEL, SIR ROBERT, Bart. (1788–1850), English statesman, was born on the 5th of February 1788 at Chamber Hall, in the neighbourhood of Bury, Lancashire, or, less probably, at a cottage near the Hall. He was a scion of that new aristocracy of wealth which sprang from the rapid progress of mechanical discovery and manufactures in the latter part of the 18th century. His ancestors were Yorkshire yeomen in the district of Craven, whence they migrated to Blackburn in Lancashire. His grandfather, Robert Peel, first of Peelfold, and afterwards of Brookside, near Blackburn, was a calico-printer, who, appreciating the discovery of his townsman Hargreaves, took to cotton-spinning with the spinning-jenny and grew a wealthy man. His father, Robert Peel (1750–1830), third son of the last-named, carried on the same business at Bury with still greater success, in partnership with his uncle, Mr Haworth, and Mr Yates, whose daughter, Ellen, he married. He made a princely fortune, became the owner of Drayton Manor and member of parliament for the neighbouring borough of Tamworth, was a trusted and honoured, as well as ardent, supporter of Pitt, contributed munificently towards the support of that leader's war policy, and was rewarded with a baronetcy (1800).

At Harrow, according to the accounts of his contemporaries, Peel was a steady industrious boy, the best scholar in the school, fonder of country walks with a friend than of school games, but reputed one of the best football players. At Christ Church, where he entered as a gentleman commoner, he was the first who, under the new examination statutes, took a first class both in classics and in mathematics. His examination for his B.A. degree in 1808 was an academical ovation in presence of a numerous audience, who came to hear the first man of the day. From his classical studies Robert Peel derived not only the classical, though somewhat pompous, character of his speeches and the Latin quotations with which they were often happily interspersed, but something of his lofty ideal of political ambition. To his mathematical training, which was then not common among public men, he no doubt owed in part his method, his clearness, his great power of grasping steadily and working out difficult and complicated questions. His speeches show that, in addition to his academical knowledge, he was well versed in English literature, in history, and in the principles of law, in order to study which he entered at Lincoln's Inn. But while reading hard he did not neglect to develop his tall and vigorous frame, and, though he lost his life partly through his bad riding, he was always a good shot and an untiring walker after game. His Oxford education confirmed his attachment to the Church of England. His practical mind remained satisfied with the doctrines of his youth, and he never showed that he had studied the great religious controversies of his day.

In 1809, being then in his twenty-second year, he was brought into parliament for the close borough of Cashel, which he afterwards exchanged for Chippenham, and commenced his parliamentary career under the eye of his father, then member for Tamworth, who fondly saw in him the future leader of the Tory party. In that House of Commons sat Wilberforce, Windham, Tierney, Grattan, Perceval, Castlereagh, Plunkett, Romilly, Mackintosh, Burdett, Whitbread, Horner, Brougham, Parnell, Huskisson, and, above all, George Canning. Lord Palmerston entered the house two years earlier, and Lord John Russell three years later. Among these men young Peel had to rise. And he rose, not by splendid eloquence, by profound political philosophy or by great originality of thought, but by the closest attention to all his parliamentary duties, by a study of all the business of parliament, and by a style of speaking which owed its force not to high flights of oratory, but to knowledge of the subject in hand, clearness of exposition, close reasoning, and tact in dealing with a parliamentary audience. With the close of the struggle against revolutionary France, political progress in England was soon to resume the march which that struggle had arrested. Young Peel's lot, however, was cast, through his father, with the Tory party. In his maiden speech in 1810, seconding the address, he defended the Walcheren expedition, which he again vindicated soon afterwards against the report of Lord Porchester's committee. It is said that even then his father had discerned in him a tendency to think for himself, and told Lord Liverpool that to make sure of his support it would be well to place him early in harness. At all events he began official life in 1810 as Lord Liverpool's under-secretary for war and the colonies under the administration of Perceval. In 1812 he was transferred by Lord Liverpool to the more important but unhappy post of secretary for Ireland. There he was engaged till 1818 in maintaining English ascendancy over a country heaving with discontent, teeming with conspiracy, and ever ready to burst into rebellion. A middle course between Irish parties was impossible, and Peel plied the established engines of coercion and patronage with a vigorous hand. At the same time, it was his frequent duty to combat Grattan, Plunkett, Canning and the other movers and advocates of Roman Catholic emancipation in the House of Commons. He, however, always spoke on this question with a command of temper wonderful in hot youth, with the utmost courtesy towards his opponents, and with warm expressions of sympathy and even of admiration for the Irish people. He also, thus early, did his best to advocate and promote joint education in Ireland as a means of reconciling

sects and raising the character of the people. But his greatest service to Ireland as secretary was the institution of the regular Irish constabulary, nicknamed after him "Peelers," for the protection of life and property in a country where both were insecure. His moderation of tone did not save him from the violent abuse of O'Connell, whom he was ill advised enough to challenge—an affair which covered them both with ridicule. In 1817 he obtained the highest parliamentary distinction of the Tory party by being elected member for the university of Oxford—an honour for which he was chosen in preference to Canning on account of his hostility to Roman Catholic emancipation, Lord Eldon lending him his best support. In the following year he resigned the Irish secretaryship, of which he had long been very weary, and remained out of office till 1821. But he still supported the ministers, though in the affair of Queen Caroline he stood aloof, disapproving some steps taken by the government, and sensitive to popular opinion; and when Canning retired on account of this affair Peel declined Lord Liverpool's invitation to take the vacant place in the cabinet. During this break in his tenure of office he had some time for reflection, which there was enough in the aspect of the political world to move. But early office had done its work. It had given him excellent habits of business, great knowledge and a high position; but it had left him somewhat stiff and punctilious, too cold and reserved and over-anxious for formal justifications when he might well have left his conduct to the judgment of men of honour and the heart of the people. At the same time he was no pedant in business; in corresponding on political subjects he loved to throw off official forms and communicate his views with the freedom of private correspondence; and where his confidence was given, it was given without reserve.

At this period he was made chairman of the bullion committee on the death of Horner. He was chosen for this important office by Huskisson, Ricardo and their fellow-economists, who saw in him a mind open to conviction, though he owed hereditary allegiance to Pitt's financial policy, and had actually voted with his Pittite father for a resolution of Lord Liverpool's government asserting that Bank of England notes were equivalent to legal coin. The choice proved judicious. Peel was converted to the currency doctrines of the economists, and proclaimed his conversion in a great speech on the 24th of May 1819, in which he moved and carried four resolutions embodying the recommendations of the bullion committee in favour of a return to cash payments. This laid the foundation of his financial reputation, and his co-operation with the economists tended to give a liberal turn to his commercial principles. In the course he took he somewhat diverged from his party, and particularly from his father, who remained faithful to Pitt's depreciated paper, and between whom and his schismatic son a solemn and touching passage occurred in the debate. The author of the Cash Payments Act had often to defend his policy, and he did so with vigour. The act is sometimes said to have been hard on debtors, including the nation as debtor, because it required debts to be paid in cash which had been contracted in depreciated paper; and Peel, as heir to a great fundholder, was even charged with being biased by his personal interests. But it is answered that the Bank Restriction Acts, under which the depreciated paper had circulated, themselves contained a provision for a return to cash payments six months after peace.

In 1820 Peel married Julia, daughter of General Sir John Floyd, who bore him five sons and two daughters. The writers who have most severely censured Sir Robert Peel as a public man have dwelt on the virtues and happiness of his private and domestic life. He was not only a most loving husband and father but a true and warm-hearted friend. In Whitehall Gardens or at Drayton Manor he gathered some of the most distinguished intellects of the day. He indulged in free and cheerful talk, and sought the conversation of men of science; he took delight in art, and was a great collector of pictures; he was fond of farming and agricultural improvements; he actively promoted useful works and the advancement of knowledge; he loved making his friends, dependants, tenants and neighbours happy. And, cold as he was in public, few men could be more bright and genial in private than Sir Robert Peel.

In 1821 Peel consented to strengthen the enfeebled ministry of Lord Liverpool by becoming home secretary; and in that capacity he had again to undertake the office of coercing the growing discontent in Ireland, of which he remained the real administrator, and had again to lead in the House of Commons the opposition to the rising cause of Roman Catholic emancipation. In 1825, being defeated on the Roman Catholic question in the House of Commons, he wished to resign office, but Lord Liverpool pleaded that his resignation would break up the government. He found a congenial task in reforming and humanizing the criminal law, especially those parts of it which related to offences against property and offences punishable by death. The five acts in which Peel accomplished this great work, as well as the great speech of the 9th of March 1826, in which he opened the subject to the house, will form one of the most solid and enduring monuments of his fame. Criminal law reform was the reform of Romilly and Mackintosh, from the hands of the latter of whom Peel received it. But the masterly bills in which it was embodied were the bills of Peel—not himself a creative genius, but, like the founder of his house, a profound appreciator of other men's creations, and unrivalled in the power of giving them practical and complete effect.

In 1827 the Liverpool ministry was broken up by the fatal illness of its chief, and under the new premier, George Canning, Peel, like the duke of Wellington and other high Tory members of Lord Liverpool's cabinet, refused to serve. Canning and Peel were rivals; but we need not interpret as mere personal rivalry that which was certainly, in part at least, a real difference of connexion and opinion. Canning took a Liberal line, and was supported by many of the Whigs; the seceders were Tories, and it is difficult to see how their position in Canning's cabinet could have been otherwise than a false one. Separation led to public coolness and occasional approaches to bitterness on both sides in debate. But there seems no ground for exaggerated complaint against Peel's conduct. Canning himself said to a friend that "Peel was the only man who had behaved decently towards him." Their private intercourse remained uninterrupted to the end; and Canning's son afterwards entered public life under the auspices of Peel. The charge of having urged Roman Catholic emancipation on Lord Liverpool in 1825, and opposed Canning for being a friend to it in 1827, made against Sir Robert Peel in the fierce corn-law debates of 1846, has been withdrawn by those who made it.

In January 1828, after Canning's death, the duke of Wellington formed a Tory government, in which Peel was home secretary and leader of the House of Commons. This cabinet, Tory as it was, did not include the impracticable Lord Eldon, and did include Huskisson and three more friends of Canning. Its policy was to endeavour to stave off the growing demand for organic change by administrative reform, and by lightening the burdens of the people. The civil list was retrenched with an unsparing hand, the public expenditure was reduced lower than it had been since the Revolutionary war, and the import of corn was permitted under a sliding scale of duties. Peel also introduced into London the improved system of police which he had previously established with so much success in Ireland. But the tide ran too strong to be thus headed. First the government were compelled, after a defeat in the House of Commons, to acquiesce in the repeal of the Test and Corporation Acts, Peel bringing over their High Church supporters, as far as he could. Immediately afterwards the question of Roman Catholic emancipation was brought to a crisis by the election of O'Connell for the county of Clare. In August Peel expressed to the duke of Wellington his conviction that the question must be settled. He wrote that out of office he would co-operate in the settlement but in his judgment it should be committed to other hands than his. To this the duke assented, but in January 1829, owing to the declared opinions of the king, of the House of Lords, and of the Church against a change of policy, Wellington came to the

conclusion that without Peel's aid in office there was no prospect of success. Under that pressure Peel consented to remain, and all the cabinet approved. The consent of the king, which could scarcely have been obtained except by the duke and Peel, was extorted, withdrawn (the ministers being out for a few hours), and again extorted; and on the 5th of March 1829 Peel proposed Roman Catholic emancipation in a speech of more than four hours. The apostate was overwhelmed with obloquy. Having been elected for the university of Oxford as a leading opponent of the Roman Catholics, he had thought it right to resign his seat on being converted to emancipation. His friends put him again in nomination, but he was defeated by Sir R. H. Inglis. He took refuge in the close borough of Westbury, whence he afterwards removed to Tamworth, for which he sat till his death. Catholic emancipation was forced on Peel by circumstances; but it was mainly owing to him that the measure was complete, and based upon equality of civil rights. This great concession, however, did not save the Tory government. The French Revolution of July 1830 gave fresh strength to the movement against them, though, schooled by the past, they promptly recognized King Louis Philippe. The parliamentary reform movement was joined by some of their offended Protestant supporters. The duke of Wellington committed them fatally against all reform, and the elections went against them on the demise of the Crown; they were beaten on Sir H. Parnell's motion for a committee on the civil list, and Wellington took the opportunity to resign rather than deal with reform.

While in office, Peel succeeded to the baronetcy, Drayton Manor and a great estate by the death of his father (May 3, 1830). The old man had lived to see his fondest hopes fulfilled in the greatness of his son; but he had also lived to see that a father must not expect to fix his son's opinions—above all, the opinions of such a son as Sir Robert Peel, and in such an age as that which followed the French Revolution.

Sir Robert Peel's resistance to the Reform Bill won back for him the allegiance of his party. His opposition was resolute but it was temperate, and once only he betrayed the suppressed fire of his temper, in the historical debate of the 22nd of April 1831, when his speech was broken off by the arrival of the king to dissolve the parliament which had thrown out reform. He refused to join the duke of Wellington in the desperate enterprise of forming a Tory government at the height of the storm, when the Grey ministry had gone out on the refusal of the king to promise them an unlimited creation of peers. By this conduct he secured for his party the full benefit of the reaction which he no doubt knew was sure to ensue. The general election of 1832, after the passing of the Reform Bill, left him with barely 150 followers in the House of Commons; but this handful rapidly swelled under his management into the great Conservative party. He frankly accepted the Reform Act as irrevocable, taught his party to register instead of despairing, appealed to the intelligence of the middle classes, whose new-born power he appreciated, steadily supported the Whig ministers against the Radicals and O'Connell, and gained every moral advantage which the most dignified and constitutional tactics could afford. To this policy, and to the great parliamentary powers of its author, it was mainly due that, in the course of a few years, the Conservatives were as strong in the reformed parliament as the Tories had been in the unreformed. It is vain to deny the praise of genius to such a leader, though the skill of a pilot who steered for many years over such waters may sometimes have resembled craft. But the duke of Wellington's emphatic eulogy on him was, "Of all the men I ever knew, he had the greatest regard for truth." The duke might have added that his own question, "How is the king's government to be carried on in a reformed parliament?" was mainly solved by the temperate and constitutional policy of Sir Robert Peel, and by his personal influence on the debates and proceedings of the House of Commons during the years which followed the Reform Act.

In 1834, on the dismissal of the Melbourne ministry, power came to Sir Robert Peel before he expected or desired it. He hurried from Rome at the call of the duke of Wellington, whose sagacious modesty yielded him the first place, and became prim minister, holding the two offices of first lord of the treasury an chancellor of the exchequer. He vainly sought to include in hi cabinet two recent seceders from the Whigs, Lord Stanley an Sir James Graham. A dissolution gave him a great increase o strength in the house, but not enough. He was outvoted o the election of the speaker at the opening of the session of 1835 and, after struggling on for six weeks longer, resigned on th question of appropriating part of the revenues of the Church i Ireland to national education. His time had not yet come; bu the capacity, energy and resource he displayed in this shor tenure of office raised him immensely in the estimation of th house, his party and the country. Of the great budget o practical reforms which he brought forward, the plan for th commutation of tithes, the ecclesiastical commission, and th plan for settling the question of dissenters' marriages bore fruit

From 1835 to 1840 he pursued the same course of patient an far-sighted opposition. In 1837 the Conservative members o the House of Commons gave their leader a grand banquet a Merchant Taylors' Hall, where he proclaimed in a great speec the creed and objects of his party. In 1839, the Whigs havin resigned on the Jamaica Bill, he was called on to form a govern ment, and submitted names for a cabinet, but resigned th commission owing to the young queen's persistent refusal to par with any Whig ladies of her bedchamber (see VICTORIA, QUEEN) In 1840 he was hurried into a premature motion of want of con fidence. But in the following year a similar motion was carrie by a majority of one, and the Whigs ventured to appeal to th country. The result was a majority of ninety-one against then on a motion of want of confidence in the autumn of 1841, upo which they resigned, and Sir Robert Peel became first lord o the treasury, with a commanding majority in both House of Parliament.

The crisis called for a master-hand. The finances were i disorder. For some years there had been a growing deficit estimated for 1842 at more than two millions, and attempts t supply this by additions to assessed taxes and customs dutie had failed. The great financier took till the spring of 1842 t mature his plans. He then boldly supplied the deficit by im posing an income-tax on all incomes above £150 a year. H accompanied this tax with a reform of the tariff, by which pro hibitory duties were removed and other duties abated on a vas number of articles of import, especially the raw materials of manu factures and prime articles of food. The increased consumption as the reformer expected, countervailed the reduction of duty The income-tax was renewed and the reform of the tariff carrie still farther on the same principle in 1845. The result was, i place of a deficit of upwards of two millions, a surplus of fiv millions in 1845, and the removal of seven millions and a half o taxes up to 1847, not only without loss, but with gain to th ordinary revenue of the country. The prosperous state of th finances and of public affairs also permitted a reduction of th interest on a portion of the national debt, giving a yearly savin at once of £625,000, and ultimately of a million and a quarter t the public. In 1844 another great financial measure, the Bank Charter Act, was passed and, though severely controverted an thrice suspended at a desperate crisis, has ever since regulated the currency of the country. In Ireland O'Connell's agitation for the repeal of the Union had now assumed threatening proportions, and verged upon rebellion. The great agitator was prosecuted, with his chief adherents, for conspiracy and sedition; and, though the conviction was quashed for informality, repeal was quelled in its chief. At the same time a healing hand was extended to Ireland. The Charitable Bequests Act gave Roman Catholics a share in the administration of charities and legal power to endow their own religion. The allowance to Maynooth was largely increased, notwithstanding violent Protestant opposition. Three queen's colleges, for the higher education of all the youth of Ireland, without distinction of religion, were founded, notwithstanding violent opposition, both Protestant and Roman Catholic. The principle of toleration once accepted, was thoroughly carried out. The last remnants of the penal laws

were swept from the statute-book, and justice was extended to the Roman Catholic Church in Canada and Malta. In the same spirit acts were passed for clearing from doubt Irish Presbyterian marriages, for settling the titles of a large number of dissenters' chapels in England, and removing the municipal disabilities of the Jews. The grant for national education was trebled, and an attempt was made, though in vain, to introduce effective education clauses into the factory bills. To the alienation of any part of the revenues of the Established Church Sir Robert Peel never would consent; but he had issued the ecclesiastical commission, and he now made better provision for a number of populous parishes by a redistribution of part of the revenues of the Church. The weakest part of the conduct of this great government, perhaps, was its failure to control the railway mania by promptly laying down the lines on a government plan. It passed an act in 1844 which gave the government a right of purchase, and it had prepared a palliative measure in 1846, but was compelled to sacrifice this, like all other secondary measures, to the repeal of the corn laws. It failed also, though not without an effort, to avert the great schism in the Church of Scotland. Abroad it was as prosperous as at home. It had found disaster and disgrace in Afghanistan. It speedily ended the war there, and in India the invading Sikhs were destroyed upon the Sutlej. The sore and dangerous questions with France, touching the right of search, the war in Morocco, and the Tahiti affair, and with the United States touching the Maine boundary and the Oregon territory, were settled by negotiation.

Yet there were malcontents in Sir Robert Peel's party. The Young Englanders disliked him because he had hoisted the flag of Conservatism instead of Toryism on the morrow of the Reform Bill. The strong philanthropists and Tory Chartists disliked him because he was a strict economist and an upholder of the new poor law. But the fatal question was protection. That question was being fast brought to a crisis by public opinion and the Anti-Corn-Law League. Sir Robert Peel had been recognized in 1841 by Cobden as a Free Trader, and after experience in office he had become in principle more and more so. Since his accession to power he had lowered the duties of the sliding scale, and thereby caused the secession from the cabinet of the duke of Buckingham. He had alarmed the farmers by admitting foreign cattle and meat under his new tariff, and by admitting Canadian corn. He had done his best in his speeches to put the maintenance of the corn laws on low ground, and to wean the landed interest from their reliance on protection. The approach of the Irish famine in 1845 turned decisively the wavering balance. When at first Sir Robert proposed to his cabinet the revision of the corn laws, Lord Stanley and the duke of Buccleuch dissented, and Sir Robert resigned. But Lord John Russell failed to form a new government. Sir Robert again came into office; and now, with the consent of all the cabinet but Lord Stanley, who retired, he, in a great speech on the 27th of January 1846, brought the repeal of the corn laws before the House of Commons. In the long and fierce debate that ensued he was assailed, both by political and personal enemies, with the most virulent invective, which he bore with his wonted calmness, and to which he made no retorts. His measure was carried; but immediately afterwards the offended protectionists, led by Lord George Bentinck and Benjamin Disraeli, coalesced with the Whigs, and threw him out on the Irish Coercion Bill. He went home from his defeat, escorted by a great crowd, who uncovered as he passed, and he immediately resigned. So fell a Conservative government which would otherwise have probably ended only with the life of its chief.

Though out of office he was not out of power. He had "lost a party, but won a nation." The Whig ministry which succeeded him leant much on his support, with which he never taxed them. He joined them in carrying forward free-trade principles by the repeal of the navigation laws. He helped them to promote the principle of religious liberty by the bill for the emancipation of the Jews. One important measure was his own. While in office he had probed, by the Devon commission of inquiry, the sores of Ireland connected with the ownership and occupation of land. In 1849, in a speech on the Irish Poor Laws, he first suggested, and in the next year he aided in establishing, a commission to facilitate the sale of estates in a hopeless state of encumbrance. The Encumbered Estates Act made no attempt, like later legislation, to secure by law the uncertain customary rights of Irish tenants, but it transferred the land from ruined landlords to solvent owners capable of performing the duties of property towards the people. On the 28th of June 1850 Sir Robert Peel made a great speech on the Greek question against Lord Palmerston's foreign policy of interference. This speech was thought to show that if necessary he would return to office. It was his last. On the following day he was thrown from his horse on Constitution Hill, and mortally injured by the fall. Three days he lingered and on the fourth (July 2, 1850) he died. All the tributes which respect and gratitude could pay were paid to him by the sovereign, by parliament, by public men of all parties, by the country, by the press, and, above all, by the great towns and the masses of the people to whom he had given "bread unleavened with injustice." He would have been buried among the great men of England in Westminster Abbey, but his will desired that he might be laid in Drayton Church. It also renounced a peerage for his family, as he had before declined the garter for himself when it was offered him by the queen through Lord Aberdeen.

Those who judge Sir Robert Peel will remember that he was bred a Tory in days when party was a religion; that he entered parliament a youth, was in office at twenty-four and secretary for Ireland at twenty-five; that his public life extended over a long period rife with change; and that his own changes were all forward and with the advancing intellect of the time. They will enumerate the great practical improvements and the great acts of legislative justice of those days, and note how large a share Sir Robert Peel had, if not in originating, in giving thorough practical effect to all. They will reflect that as a parliamentary statesman he could not govern without a party, and that it is difficult to govern at once for a party and for the whole people. They will think of his ardent love of his country, of his abstinence from intrigue, violence and faction, of his boundless labour through a long life devoted to the public service. Whether he was a model of statesmanship may be doubted. Models of statesmanship are rare, if by a model of statesmanship is meant a great administrator and party leader, a great political philosopher and a great independent orator, all in one. But if the question is whether he was a ruler loved and trusted by the English people there is no arguing against the tears of a nation.

Those who wish to know more of him will consult his own posthumous *Memoirs* (1856), edited by his literary executors Earl Stanhope and Viscount Cardwell; his private correspondence, edited by C. S. Parker (1891 1899); the four volumes of his speeches; a sketch of his life and character by Sir Lawrence Peel (1860); an historical sketch by Lord Dalling (1874); Guizot's *Sir Robert Peel* (1857); Künzel's *Leben und Reden Sir Robert Peel's* (1851); Disraeli's *Life of Lord George Bentinck* (1858); Morley's *Life of Cobden*; monographs by F. C. Montague (1888), J. R. Thursfeld (1891), and the earl of Rosebery (1899); *Peel and O'Connell*, by Lord Eversley; the *Life of Sir J. Graham* (1907), by C. S. Parker; Lord Stanmore's *Life of Lord Aberdeen* (1893); and the general histories of the time. (C. S. P.)

Four of Sir Robert's five sons attained distinction. The eldest, Sir Robert Peel (1822–1895), who became the 3rd baronet on his father's death, was educated at Harrow and at Christ Church, Oxford. He was in the diplomatic service from 1844 to 1850, when he succeeded his father as member of parliament for Tamworth, and he was chief secretary to the lord-lieutenant of Ireland from 1861 to 1865. He represented Tamworth until the general election of 1880; in 1884 he became member for Huntingdon and in 1885 for Blackburn, but after 1886 he ceased to sit in the House of Commons. Sir Robert described himself as a Liberal-Conservative, but in his later years he opposed the policy of Gladstone, although after 1886 he championed the cause of home rule for Ireland. In 1871 he sold his father's collection of pictures to the National Gallery for £75,000, and in his later life he was troubled by financial difficulties. Sir Robert was interested in racing, and was known on the

turf as Mr F. Robinson. He died in London on the 9th of May 1895, and was succeeded as 4th baronet by his son, Sir Robert Peel (b. 1867).

SIR FREDERICK PEEL (1823–1906), the prime minister's second son, was educated at Harrow and at Trinity College, Cambridge, becoming a barrister in 1849. He entered parliament in that year, and with the exception of the period between 1857 and 1859 he remained in the House of Commons until 1865. In 1851–1852 and again in 1853–1855 he was under-secretary for the colonies; from 1855 to 1857 he was under-secretary for war; and from 1859 to 1865 he was secretary to the treasury. He became a privy councillor in 1857 and was knighted in 1869. Sir Frederick Peel's chief service to the state was in connexion with the railway and canal commission. He was appointed a commissioner on the inception of this body in 1873, and was its president until its reconstruction in 1888, remaining a member of the commission until his death on the 6th of June 1906.

The third son was SIR WILLIAM PEEL (1824–1858), and the youngest VISCOUNT PEEL (*q.v.*). Sir William was a sailor, who distinguished himself in the Crimea, where he gained the Victoria Cross, and also during the Indian Mutiny, being wounded at the relief of Lucknow. He died on the 27th of April 1858. Sir William wrote *A Ride through the Nubian Desert* (1852), giving an account of his travels in 1851.

Two of Sir Robert Peel's brothers were also politicians of note. WILLIAM YATES PEEL (1789–1858), educated at Harrow and at St John's College, Cambridge, was a member of parliament from 1817 to 1837, and again from 1847 to 1852; he was under-secretary for home affairs in 1828, and was a lord of the treasury in 1830 and again in 1834–1835. JONATHAN PEEL (1799–1879) was first a soldier and then a member of parliament during the long period between 1826 and 1868, first representing Norwich and then Huntingdon. From 1841 to 1846 he was surveyor-general of the ordnance, and in 1858–1859 and again in 1866–1867 he was a very competent and successful secretary of state for war. General Peel was also an owner of racehorses, and in 1844 his horse Orlando won the Derby, after another horse, Running Rein, had been disqualified.

For the history of the Peel family see Jane Haworth, *A Memoir of the Family of Peel from the year 1600* (1836).

PEEL, a seaport and watering-place of the Isle of Man, on the W. coast, 11½ m. W.N.W. of Douglas by the Isle of Man railway. Pop. (1901), 3304. It lies on Peel Bay, at the mouth of the small river Neb, which forms the harbour. The old town consists of narrow streets and lanes, but a modern residential quarter has grown up to the east. On the west side of the river-mouth St Patrick's Isle is connected with the mainland by a causeway. It is occupied almost wholly by the ruins of Peel castle. St Patrick is said to have founded here the first church in Man, and a small chapel, dedicated to him, appears to date from the 8th or 10th century. There is a round tower, also of very early date, resembling in certain particulars the round towers of Ireland. The ruined cathedral of St German has a transitional Norman choir, with a very early crypt beneath, a nave with an early English triplet at the west end, transepts, and a low and massive central tower still standing. There are remains of the bishops' palace, of the so-called Fenella's tower, famous through Scott's *Peveril of the Peak*, of the palace of the Lords of Man, of the keep and guardroom above the entrance to the castle, and of the Moare or great tower, while the whole is surrounded by battlements. There are also a large artificial mound supposed to be a defensive earthwork of higher antiquity than the castle, and another mound known as the Giant's Grave. The guardroom is associated with the ghostly apparition of the Moddey Dhoo (black dog), to which reference is made in *Peveril of the Peak*. In 1397 Richard II. condemned the earl of Warwick to imprisonment in Peel Castle for conspiracy, and in 1444 Eleanor, duchess of Gloucester, received a like sentence on the ground of having compassed the death of Henry VI. by magic. Peel has a long-established fishing industry, which, however, has declined in modern times. In the town the most notable building is the church of St German, with a fine tower and spire. Peel was called by the Northmen *Holen* (island, *i.e.* St Patrick's Isle); the existing name is Celtic, meaning "fort" (cf. the peel towers of the borderland of England and Scotland).

PEEL. (1) The skin or rind of a fruit; thus "to peel" is to remove the outer covering of anything. The etymology of the word is closely connected with that of "pill," to plunder, surviving in "pillage." Both words are to be referred to French and thence to Latin. In French *peler* and *piller*, though now distinguished in meaning (the first used of stripping bark or rind, the second meaning to rob), were somewhat confused in application, and a similar confusion occurs in English till comparatively late. The Latin words from which they are derived are *pellis*, skin, and *pilare*, to strip of hair (*pilus*). (2) The name of a class of small fortified dwelling-houses built during the 16th century on the borders between Scotland and England. They are also known as "bastel-houses," *i.e.* "bastille-houses," and consist of a square massive tower with high pitched roof, the lower part being vaulted, the upper part containing a few living rooms. The entrance is on the upper floor, access being gained by a movable ladder. The vaulted ground-floor chamber served for the cattle when there was danger of attack. The word appears in various forms, *e.g. pele, peil*, and latinized as *pelum*, &c.; "pile" is also found used synonymously, but the *New English Dictionary* (*s.v. pile*) considers the two words distinct. It seems more probable that the word is to be identified with "pale," a stake (Lat. *palus*). The earlier meaning of "peel" is a palisaded enclosure used as an additional defence for a fortified post or as an independent stronghold.

PEELE, GEORGE (1558–*c.* 1598), English dramatist, was born in London in 1558. His father, who appears to have belonged to a Devonshire family, was clerk of Christ's Hospital, and wrote two treatises on book-keeping. George Peele was educated at Christ's Hospital, and entered Broadgates Hall (Pembroke College), Oxford, in 1571. In 1574 he removed to Christ Church, taking his B.A. degree in 1577, and proceeding M.A. in 1579. In 1579 the governors of Christ's Hospital requested their clerk to "discharge his house of his son, George Peele." It is not necessary to read into this anything more than that the governors insisted on his beginning to earn a livelihood. He went up to London about 1580, but in 1583 when Albertus Alasco (Albert Laski), a Polish nobleman, was entertained at Christ Church, Oxford, Peele was entrusted with the arrangement of two Latin plays by William Gager (*fl.* 1580–1619) presented on the occasion. He was also complimented by Dr Gager for an English verse translation of one of the *Iphigenias* of Euripides. In 1585 he was employed to write the *Device of the Pageant borne before Woolston Dixie*, and in 1591 he devised the pageant in honour of another lord mayor, Sir William Webbe. This was the *Descensus Astraeae* (printed in the *Harleian Miscellany*, 1808), in which Queen Elizabeth is honoured as Astraea. Peele had married as early as 1583 a lady who brought him some property, which he speedily dissipated. Robert Greene, at the end of his *Groatsworth of Wit*, exhorts Peele to repentance, saying that he has, like himself, "been driven to extreme shifts for a living." The sorry traditions of his reckless life were emphasized by the use of his name in connexion with the apocryphal *Merrie conceited Jests of George Peele* (printed in 1607). Many of the stories had done service before, but there are personal touches that may be biographical. He died before 1598, for Francis Meres, writing in that year, speaks of his death in his *Palladis Tamia*.

His pastoral comedy of *The Araygnement of Paris*, presented by the Children of the Chapel Royal before Queen Elizabeth perhaps as early as 1581, was printed anonymously in 1584. Charles Lamb, sending to Vincent Novello a song from this piece of Peele's, said that if it had been less uneven in execution Fletcher's *Faithful Shepherdess* "had been but a second name in this sort of writing." Peele shows considerable art in his flattery. Paris is arraigned before Jupiter for having assigned the apple to Venus. Diana, with whom the final decision rests, gives the apple to none of the competitors but to a nymph called Eliza, whose identity is confirmed by the further

explanation, "whom some Zabeta eall." *The Famous Chronicle of King Edward the first, sirnamed Edward Longshankes, with his returne from the holy land. Also the life of Lleuellen, rebell in Wales. Lastly, the sinking of Queen Elinor, who suncke at Charingcrosse, and rose again at Potters-hith, now named Queenehith* (printed 1593). This "chronicle history," formless enough, as the rambling title shows, is nevertheless an advance on the old chronicle plays, and marks a step towards the Shakespearian historical drama. *The Battell of Alcazar—with the death of Captaine Stukeley* (acted 1588–1589, printed 1594), published anonymously, is attributed with much probability to Peele. *The Old Wives Tale*, registered in Stationers' Hall, perhaps more correctly, as "The Owlde wifes tale" (printed 1595), was followed by *The Love of King David and fair Bethsabe* (written *c.* 1588, printed 1599), which is notable as an example of Elizabethan drama drawn entirely from scriptural sources. Mr Fleay sees in it a political satire, and identifies Elizabeth and Leicester as David and Bathsheba, Mary Queen of Scots as Absalom. *Sir Clyomon and Sir Clamydes* (printed 1599) has been attributed to Peele, but on insufficient grounds. Among his occasional poems are "The Honour of the Garter," which has a prologue containing Peele's judgments on his contemporaries, and "Polyhymnia" (1590), a blank-verse description of the ceremonies attending the retirement of the queen's champion, Sir Henry Lee. This is concluded by the "Sonnet," "His golden locks time hath to silver turn'd," quoted by Thackeray in the 76th chapter of *The Newcomes*. To the *Phoenix Nest* in 1593 he contributed "The Praise of Chastity." Mr F. G. Fleay (Biog. Chron. of the Drama) credits Peele with *The Wisdom of Doctor Doddipoll* (printed 1600), *Wily Beguiled* (printed 1606), *The Life and Death of Jack Straw, a notable rebel* (1587 ?), a share in the First and Second Parts of *Henry VI.*, and on the authority of Wood and Winstanley, *Alphonsus, Emperor of Germany*.

Peele belonged to the group of university scholars who, in Greene's phrase, "spent their wits in making playes." Greene went on to say that he was "in some things rarer, in nothing inferior," to Marlowe. Nashe in his preface to Greene's *Menaphon* called him "the chief supporter of pleasance now living, the *Atlas* of Poetrie and *primus verborum artifex,* whose first encrease, the *Arraignement of Paris*, might plead to your opinions his pregnant dexteritie of wit and manifold varietie of invention, wherein (*me judice*) hee goeth a step beyond all that write." This praise was not unfounded. The credit given to Greene and Marlowe for the increased dignity of English dramatic diction, and for the new smoothness infused into blank verse, must certainly be shared by Peele. Professor F. B. Gummere, in a critical essay prefixed to his edition of *The Old Wives Tale*, puts in another claim for Peele. In the contrast between the romantic story and the realistic dialogue he sees the first instance of humour quite foreign to the comic "business" of earlier comedy. *The Old Wives Tale* is a play within a play, slight enough to be perhaps better described as an interlude. Its background of rustic folk-lore gives it additional interest, and there is much fun poked at Gabriel Harvey and Stanyhurst. Perhaps Huanebango,[1] who parodies Harvey's hexameters, and actually quotes him on one occasion, may be regarded as representing that arch-enemy of Greene and his friends.

Peele's *Works* were edited by Alexander Dyce (1828, 1829–1839 and 1861); by A. H. Bullen (2 vols., 1888). An examination of the metrical peculiarities of his work is to be found in F. A. R. Lämmerhirt's *Georg Peele, Untersuchungen über sein Leben und seine Werke* (Rostock, 1882). See also Professor F. B. Gummere, in *Representative English Comedies* (1903); and an edition of *The Battell of Alcazar*, printed for the Malone Society in 1907.

PEEP-OF-DAY BOYS, an Irish Protestant secret society, formed about 1785. Its object was to protect the Protestant peasantry, and avenge their wrongs on the Roman Catholics. The "Boys" gained their name from the hour of dawn which they chose for their raids on the Roman Catholic villages. The Roman Catholics in return formed the society of "The Defenders."

[1] Mr Fleay goes so far as to see in the preposterous names of Huanebango's kith and kin puns on Harvey's father's trade. "Polymachaeroplacidus" he interprets as "Polly-make-a-rope-lass"!

PEEPUL, or PIPUL (*Ficus religiosa*), the "sacred fig" tree of India, also called the Bo tree. It is not unlike the banyan, and is venerated both by the Buddhists of Ceylon and the Vaishnavite Hindus, who say that Vishnu was born beneath its shade. It is planted near temples and houses; its sap abounds in caoutchouc, and a good deal of lac is obtained from insects who feed upon the branches. The fruit is about the size of a walnut and is not much eaten.

PEERAGE (Fr. *pairage*, med. Lat. *paragium*; M.E. *pere*, O. Fr. *per*, *peer*, later *pair*; Lat. *paris*, "equal"). Although in England the terms "peerage," "nobility," "House of Lords" are in common parlance frequently regarded as synonymous, in reality each expresses a different meaning. A man may be a peer and yet not a member of the House of Lords, a member of the House of Lords and yet not strictly a peer; though all peers (as the term is now understood) are members of the House of Lords either *in esse* or *in posse*. In the United Kingdom the rights, duties and privileges of peerage are centred in an individual; to the monarchical nations of the Continent nobility conveys the idea of family, as opposed to personal, privilege.

Origin of Peerage.

Etymologically "peers" are "equals" (*pares*), and in Anglo-Norman days the word was invariably so understood. The feudal tenants-in-chief of the Crown were all the peers of each other, whether lords of one manor or of a hundred; so too a bishop had his ecclesiastical peer in a brother bishop, and the tenants of a manor their peers in their fellow-tenants. That even so late as the reign of John the word was still used in this general sense is clear from Magna Carta, for the term "judicium parium" therein must be understood to mean that every man had a right to be tried by his equals. This very right was asserted by the barons as a body in 1233 on behalf of Richard, earl marshal, who had been declared a traitor by the king's command, and whose lands were forfeited without proper trial. In 1233 the French bishop Peter des Roches, Henry III.'s minister, denied the barons' right to the claim set up on the ground that the king might judge all his subjects alike, there being, he said, no peers in England (Math. Paris. 389). The English barons undoubtedly were using the word in the sense it held in Magna Carta, while the bishop probably had in his mind the French peers (*pairs de France*), a small and select body of feudatories possessed of exceptional privileges. In England the term was general, in France technical. The change in England was gradual, and probably gathered force as the gulf between the greater barons and the lesser widened, until in course of time, for judicial purposes, there came to be only two classes, the greater barons and the rest of the people. The barons remained triable by their own order (*i.e.* by their peers), whilst the rest of the people rapidly became subject to the general practice and procedure of the king's justices. The first use of the word "peers" as denoting those members of the baronage who were accustomed to receive regularly a writ of summons to parliament is found in the record of the proceedings against the Despensers in 1321 (Stubbs, *Const. Hist.* ii. 347), and from that time this restricted use of the word has remained its ordinary sense.

Anglo-Norman Baronage.

Properly to understand the growth and constitution of the peerage it is necessary to trace the changes which occurred in the position of the Anglo-Norman baronage, first through the gradual strengthening of royal supremacy with the consequent decay of baronial power locally, and subsequently by the consolidation of parliamentary institutions during the reigns of the first three Edwards.

The Saxon Witenagemot.

Before the conquest the national assembly of England (see PARLIAMENT) was the Witan, a gathering of notables owing their presence only to personal influence and standing. The imposition of a modified feudal system resulted in a radical alteration. Membership of the Great Councils of the Norman kings was primarily an incident of

tenure, one of the obligations the tenants-in-chief were bound to perform, although this membership gradually became restricted by the operation of the Royal prerogative to a small section of the baronial class and eventually hereditary by custom. The Norman Councils may have arisen from the ashes of a Saxon Witenagemot, but there is little evidence of any historical continuity between the two. The Church in England, as in Christendom generally, occupied a position of paramount importance and far-reaching influence; its leaders, not alone from their special sanctity as ecclesiastics, but as practically the only educated men of the period, of necessity were among the chief advisers of every ruler in western Europe. In England churchmen formed a large proportion of the Witan, the more influential of the great landowners making up the rest of its membership.

In place of the scattered individual and absolute ownership of Saxon days the Conqueror became practically the sole owner of the soil. The change, though not immediately complete, followed rapidly as the country settled down and the power of the Crown extended to its outlying frontiers. As Saxon land gradually passed into Norman hands the new owners became direct tenants of the king. Provided their loyal and military obligations were duly performed they had fixity of tenure for themselves and their heirs. In addition fixed money payments were exacted on the succession of the heir, when the king's eldest son was knighted, his eldest daughter married, or his person ransomed from captivity. In like manner and under similar conditions the king's tenants, or as they were termed tenants-in-chief, sub-granted the greater portion of their holdings to their own immediate followers. Under Norman methods the manor was the unit of local government and jurisdiction, and when land was given away by the king the gift invariably took the form of a grant of one or more manors.

Norman Feudal Tenure.

When he brought England into subjection the Conqueror's main idea was to exalt the central power of the Crown at the expense of its feudatories, and the first two centuries following the conquest tell one long tale of opposition by the great tenants-in-chief to a steadily growing and unifying royal pressure. With this idea of royal supremacy firmly fixed in his mind, William's grants, excepting outlying territory such as the marches of Wales or the debateable ground of the Scottish border, which needed special consideration, were seldom in bulk, but took the form of manors scattered over many counties. Under such conditions it was practically impossible for a great tenant to set up a powerful *imperium in imperio* (such as the fiefs of Normandy, Brittany and Burgundy), as his forces were distributed over the country, and could be reached by the long arm of royal power, acting through the sheriff of every county, long before they could effectively come together for fighting purposes. The tenants-in-chief were termed generally barons (see BARON) and may be regarded historically as the parents of the peers of later days. The pages of Domesday (1086), the early Norman fiscal record of England, show how unevenly the land was distributed; of the fifteen hundred odd tenants mentioned the majority held but two or three manors, while a favoured few possessed more than a hundred each. Land was then the only source of wealth, and the number of a baron's manors might well be regarded as a correct index of his importance.

The king's tenants owed yet another duty, the service of attending the King's Court (*curia regis*), and out of this custom grew the parliaments of later days. In theory all the king's tenants-in-chief, great and small, had a right to be present as incident to their tenure. It has therefore been argued by some authorities that as the Conqueror's system of tenure constituted him the sole owner of the land, attendance at his courts was solely an incident of tenure, the Church having been compelled to accept the same conditions as those imposed on laymen. But, as already pointed out, the change in tenure had not been immediate, and there had been no general forfeiture suffered by ecclesiastical bodies; consequently throughout the early years of William's reign some of the English bishops and abbots attended his courts as much by virtue of their personal and ecclesiastical importance as by right of tenure. The King's Court was held regularly at the three great festivals of the Church and at such other times as were deemed advisable. The assembly for several generations neither possessed nor pretended to any legislative powers. Legislative power was a product of later years, and grew out of the custom of the Estates granting supplies only on condition that their grievances were first redressed. The great bulk of the tenants were present for the purpose of assenting to special taxation above and beyond their ordinary feudal dues. When necessary a general summons to attend was sent through the sheriff of every county, who controlled a system of local government which enabled him to reach every tenant. In course of time to a certain number of barons and high ecclesiastics, either from the great extent of their possessions, their official duties about the king or their personal importance, it became customary to issue a personal writ of summons, thus distinguishing them from the general mass summoned through the sheriff. That this custom was in being within a century of the Conquest is clear from an incident in the bitter fight for supremacy between Archbishop Becket and Henry II. in 1164 (Stubbs, *Const. Hist.* i. 504), it being recorded that the king withheld the archbishop's personal summons to parliament, and put upon him the indignity of a summons through the sheriff. During the succeeding fifty years the line becomes even more definite, though it is evident that the Crown sometimes disregarded the custom, as the barons are found complaining that many of their number deemed entitled to a personal summons had frequently been overlooked.

The King's Court.

The sequel to these complaints is found in Magna Carta, wherein it is provided that the archbishops, bishops, abbots, earls and greater barons are to be called up to the council by writ directed to each severally; and all who hold of the king in chief, below the rank of greater barons, are to be summoned by a general writ addressed to the sheriff of their shire.[1] Magna Carta thus indicates the existence of two definite sections of the king's tenants, a division which had evidently persisted for some time. The "greater barons" are the immediate parents of the peerages of later days, every member of which for more than four centuries had a seat in the House of Lords. As for the rest of the tenants-in-chief, poorer in estate and therefore of less consequence, it is sufficient here to note that they fell back into the general mass of country families, and that their representatives, the knights of the shire, after some hesitation, at length joined forces with the city and burgher representatives to form the House of Commons.

Magna Carta and Personal Summons to the Majores Barones.

In 1254, instead of the general summons through the sheriff to all the lesser tenants-in-chief, the king requires them to elect two knights for each shire to attend the council as the accredited representative of their fellows. In the closing days of 1264 Simon de Montford summoned to meet him early in 1265 the first parliament worthy of the name, a council in which prelates, earls and greater barons, knights of the shire, citizens and burghers were present, thus constituting a representation of all classes of people. It has been argued that this assembly cannot be regarded as a full parliament, inasmuch as Simon de Montfort summoned personally only such members of the baronage as were favourable to his cause, and issued writs generally only to those counties and cities upon which he could rely to return representatives in support of his policy. Stubbs holds the view that the first assembly we ought to regard as a full parliament was the Model Parliament which met at Westminster in 1295. This parliament, unlike Simon's partisan assembly of 1265, was free and representative. To every spiritual

Parliament of 1254.

Model Parliament of 1295.

[1] Et ab habendum commune consilium regni . . . summoneri faciemus archiepiscopos, episcopos, abbates, comites et *majores barones* sigillatim per litteras nostras et praeterea faciemus summoneri in generali per vicecomites et ballivos nostros omnes illos qui de nobis tenent in capite (cited in Stubbs, *Const. Hist.* i. 547 n.).

and temporal baron accustomed to receive an individual writ, one was issued. Every county elected its knights and every city or borough of any importance was instructed by the sheriff to elect and to return its allotted number of representatives. Stubbs's view (*Const. Hist.* ii. 223) may probably be regarded as authoritative, inasmuch as it was adopted by Lord Ashbourne in the Norfolk peerage case of 1906 (*Law Reports* [1907], A.C. at p. 15). Edward I. held frequent parliaments throughout his reign, and although many must be regarded as merely baronial councils, nevertheless year after year, on all important occasions, the knights of the shire and the citizens appear in their places. The parliament of Shrewsbury in 1283, for instance, has been claimed as a full parliament in several peerage cases, but no clear decision on the point has ever been given by the Committee for Privileges. It may be taken for granted, however, that any assembly held since 1295, which did not conform substantially to the model of that year, cannot be regarded constitutionally as a full parliament. The point is even of modern importance, as in order to establish the existence of a barony by writ it must be proved that the claimant's ancestor was summoned by individual writ to a full parliament, and that either he himself or one of his direct descendants was present in parliament.

Grades of Peerage.

It is now convenient to consider the various grades into which the members of the peerage are grouped, and their relative positions. An examination of the early writs issued to individuals shows that the baronage consisted of archbishops, bishops, abbots, priors, earls and barons. In course of time every member of these classes came to hold his land by feudal tenure from the Crown, and eventually in every instance the writs issued as an incident of tenure. It is therefore necessary to discover, if possible, what combination of attributes clothed the greater baron with a right to receive the king's personal writ of summons. While the archbishops and bishops received their writs with regularity, the summonses to heads of ecclesiastical houses and greater barons were intermittent. The prelate held an office which lived on regardless of the fate of its temporary holder, and if by reason of death, absence or translation the office became vacant, a writ still issued to the "Guardian of the Spiritualities." The abbot, on the other hand, often outside the jurisdiction of the English Church, and owing allegiance to a foreign order, was but the personal representative of a land-holding community. It has already been pointed out that the amount of land held direct from the king by individuals varied greatly, and that the extent of his holding must have had something to do with a man's importance. A landless noble in those days was inconceivable. The conclusion, then, may be drawn that in theory the issue of a writ was at the pleasure of the Crown, and that in practice the moving factor in the case of the prelates was office and personal importance, and in the case of abbots and barons probably, in the main, extent of possession. There is nothing however to show that in the early years of the custom any person had a right to claim a writ if it were the king's pleasure or caprice to withhold it and to treat everyone not summoned individually as being duly summoned under the general writs issued to the sheriff of the county.

Hereditary Principle.

The next point for consideration is when did the peerage, as the baronage subsequently came to be called, develop into a body definitely hereditary? Here again growth was gradual and somewhat obscure. Throughout the reigns of the Edwards summonses were not always issued to the same individual for successive parliaments; and it is quite certain that the king never considered the issue of one writ to an individual bound the Crown to its repetition for the rest of his life, much less to his heirs in perpetuity. Again we must look to tenure for an explanation. The custom of primogeniture tended to secure estates in strict family succession, and if extent of possession had originally extracted the acknowledgment of a personal summons from the Crown it is more than probable that as successive heirs came into their inheritance they too would similarly be acknowledged. In early days the summons was a burden to be suffered of necessity, an unpleasant incident of tenure, in itself undesirable, and probably so regarded by the majority of recipients during at least the two centuries following the Conquest. The age of the Edwards was in the main a rule of settled law, of increase in population generally, of growing power in the large landowners and of opportunities for those about the person of the king. The times were changing, and in place of the idea of the writ being a burden, its receipt gradually came to be looked upon as a mark of royal favour, a recognition of position and an opportunity leading on to fortune. Once such a view was established it is easy to understand how desirous any individual would be to preserve so valuable a privilege for his posterity; and primogeniture with its strict settlement of estates pointed out an easy way. The Crown was itself an hereditary dignity; and what more natural than that it should be surrounded by an hereditary peerage? Thus the free and indiscriminate choice of the Crown became fettered by the custom that once a summons had been issued to an individual to sit in parliament and he had obeyed that summons he thereby acquired a right of summons for the rest of his lifetime; and in later years when the doctrine of nobility of blood became established his descendants were held to have acquired the same privilege by hereditary right.

Earldoms.

The earl's position in the baronage needs some explanation. Various suggestions have been made as to Saxon or Norman origin of a high official nature, but historical opinion seems generally to incline towards the theory that the term was a name of dignity conferred by royal prerogative on a person already classed among the greater barons. At first the dignity was official and certainly not hereditary, and the name of a county of which he is said to have been an officer in the king's name was not essential to his dignity as an earl. There were also men who, though Scottish and Norman earls, and commonly so addressed and summoned to parliament, were rated in England as barons (*Lords Reports*, ii. 116, 120; *Earldom of Norfolk Peerage Case, Law Reports* [1907], A.C. p. 18). Earls received individual summonses to parliament by the name of Earl (*q.v.*); but there is reason to believe, as already mentioned, that in early days at any rate they sat not in right of their earldoms but by tenure as members of the baronage.

Writ Supersedes Tenure.

If we review the political situation at the beginning of the 14th century a great change is evident. The line between those members of the baronage in parliament and the rest of the people is firmly and clearly drawn. Tenure as the sole qualification for presence in the national assembly has disappeared, and in its place there appears for the baronage a system of royal selection and for the rest of the people one of representation. The rules and customs of law relating to the baronage slowly crystallized so as to provide the House of Lords, the history of which for generations is the history of the peerage of England, whilst the representative part of parliament, after shedding the lower clergy, ultimately became the House of Commons.

Until the reign of Richard II. there is no trace of any use of the term baron (*q.v.*) as importing a personal dignity existing apart from the tenure of land, barons owing their seats in parliament to tenure and writ combined. This is borne out by the fact that a husband was often summoned to parliament in his wife's right and name, and while she lived fulfilled those feudal, military and parliamentary obligations attached to her lands which the physical disabilities of sex prevented her from carrying out in her own person (Pike, *House of Lords*, p. 103).

Peerage becomes a Personal Dignity.

Primogeniture, a custom somewhat uncertain in early Anglo-Norman days, had rapidly developed into a definite rule of law. As feudal dignities were in their origin inseparable from the tenure of land it is not surprising that they too followed a similar course of descent, although as the idea of a dignity being exclusively personal gradually emerged, some necessary deviations from the rules of law relating to the descent of land inevitably resulted. In the eleventh year of his reign Richard II. created by letters patent

John Beauchamp "Lord de Beauchamp and baron of Kyddermynster, to hold to him and the heirs of his body." These letters patent were not founded on any right by tenure of land possessed by Beauchamp, for the king makes him "for his good services and in respect of the place which he had holden at the coronation (*i.e.* steward of the household) and might in future hold in the king's councils and parliaments, and for his noble descent, and his abilities and discretion, one of the peers and barons of the kingdom of England; willing that the said John and the heirs-male of his body issuing, should have the state of baron and should be called by the name of Lord de Beauchamp and Baron of Kyddermynster." The grant rested wholly on the grace and favour of the Crown and was a personal reward for services rendered. Here then is a barony entirely a personal dignity and quite unconnected with land. From Richard's reign to the present day baronies (and indeed all other peerage honours) have continued to be conferred by patent. The custom of summons by writ was not in any way interfered with, the patent operating merely to declare the dignity and to define its devolution. Summons alone still continued side by side for many generations with summons founded on patent; but after the reign of Henry VIII. the former method fell into disuse, and during the last two hundred and fifty years there have been no new creations by writ of summons alone.[1] So from the reign of Richard II. barons were of two classes, the older, and more ancient in lineage summoned by writ alone, the honours descending to heirs-general, and the newer created by letters patent, the terms of which governed the issue of the summons and prescribed the devolution of the peerage in the line almost invariably of the direct male descendants of the person first ennobled. The principle of hereditary succession so clearly recognized in the Beauchamp creation is good evidence to show that a prescriptive right of hereditary summons probably existed in those families whose members had long been accustomed to receive individual writs. By the time the House of Lancaster was firmly seated on the throne it may be taken that the peerage had become a body of men possessing well-defined personal privileges and holding personal dignities capable of descending to their heirs.

Peerages by Tenure.

The early origin of peerages was so closely connected with the tenure of land that the idea long prevailed that there were originally peerages by tenure only, *i.e.* dignities or titles annexed to the possession (and so following it on alienation) of certain lands held in chief of the king. The older writers, Glanville (bk. ix. chs. 4, 6) and Bracton (bk. ii. ch. 16), lend some colour to the view. They are followed, but not very definitely, by Coke, Selden and Madox. Blackstone, who discusses the question in his *Commentaries* (bk. i. ch. xii.), seems to believe that such dignities existed in pre-parliamentary days but says further: "When alienations grew to be frequent, the dignity of peerage was confined to the lineage of the party ennobled, and instead of territorial became personal." The Earldom of Arundel case, in 1433, at first sight seems to confirm the theory, but it may be noted that when in later years this descent came to be discussed the high authority of an act of parliament was found necessary to confirm the succession to the dignity. The case is discussed at some length in the *Lords Reports* (ii. 115), the committee regarding it as an anomaly from which no useful precedent can be drawn. Other cases discussed in the same *Report* are those of De Lisle, Abergavenny, Fitzwalter and Berkeley. The Berkeley case of 1858–1861 (better reported 8 H.L.C. 21) is essential for the student who wishes to examine the question carefully; and may be regarded as finally putting an end to any idea of bare tenure as an existing means of establishing a peerage right (see also Cruise on *Dignities*, 2nd ed. pp. 60 et seq.).

Peerages Inalienable.

The main attribute of a peerage is that hereditary and inalienable quality which ennobles the blood of the holder and his heirs, or, as a great judge put it in 1625 in the Earldom of Oxford case, "he cannot alien or give away this inheritance because it is a personal dignity annexed to the posterity and fixed in the blood" (Dodridge, J., at p. 123, Sir W. Jones's *Reports*). Were the theory of barony by tenure accepted it would be possible for the temporary holder of such a barony to sell it or even to will it away to a stranger possessing none of the holder's blood, with the effect that, in the words of Lord Chancellor Campbell (Berkeley case, 8 H.L.C. 77), "there might be various individuals and various lines of peers successively ennobled and created peers of parliament by a subject," an impossible condition of affairs in a country where the sovereign has always been the fountain of honour. Moreover, while no peerage honour can be extinguished or surrendered, the owner of lands can freely dispose of such rights as he possesses by sale or transfer. Finally we may accept the verdict in the Fitzwalter case of 1669 (Cruise, ibid. p. 66), which was adopted by the House of Lords in the Berkeley case: "and the nature of a barony by tenure being discussed, it was found to have been discontinued for many ages, and not in being, and so not fit to be revived or to admit any pretence or right of succession thereupon."

Dukes.

Until the reign of Edward III. the peerage consisted only of high ecclesiastics, earls and barons. The earls were barons with their special name of dignity added, and their names always appear on the rolls before those of the barons. In 1337 King Edward created his son, the Black Prince, duke of Cornwall, giving him precedence over the rest of the peerage. The letters patent (under which the present heir to the throne now holds the dukedom) limited the dignity in perpetuity to the first-born son of the king of England.[2] Subsequently several members of the royal family were created dukes, but no subject received such an honour until fifty years later, when Richard II. created his favourite Robert de Vere, earl of Oxford, duke of Ireland (for life). The original intention may have been to confine the dignity to the blood royal, as with the exception of de Vere it was some years before a dukedom was again conferred on a subject.

Marquesses.

In 1385 Richard II. had created Robert de Vere marquess of Dublin, thus importing an entirely new and unknown title into the peerage. The grant was, however, only for life, and was in fact resumed by the Crown in 1387, when its recipient was created duke of Ireland. It was not until 1397 that another creation was made, this time in favour of one of the blood royal, John de Beaufort, eldest legitimated son of John of Gaunt, who became marquess of Dorset. His title was shortly afterwards taken away by Henry IV.'s first parliament. Subsequently creations were made only at long intervals, that of Winchester (1551) being the only one (of old date) under which an English marquess at present sits in the House of Lords (see MARQUESS).

Viscounts.

Under the name of viscount (*q.v.*) Henry VI. added yet another order, and the last in point of time, to the peerage, creating in 1440, John, Baron Beaumont, Viscount Beaumont and giving him precedence next above the barons. The name of this dignity was also borrowed from the Continent, having been in use for some time as a title of honour in the king's French possessions. None of the new titles above mentioned ever carried with them any official position; they were conferred originally as additional honours on men who were already members of the peerage.

Spiritual Peers, &c.

The application of the hereditary principle to temporal peerages early differentiated their holders from the spiritual peers. Both spiritual and temporal peers were equally lords of parliament, but hereditary pretensions on the one side and ecclesiastical exclusiveness on the other soon drew a sharp line of division between the two orders. Gradually the temporal peers, strong in their doctrine of "ennobled" blood, came to consider that theirs was an order

[1] Not intentional at any rate. In some cases where it was intended to call a son up in his father's barony, a mistake in the name has been made with the result that a new peerage by writ of summons has been created. The barony of Buller, of Moore Park (cr. 1663), now in abeyance, is said to be an instance of such a mistake.

[2] . . . . principi et ipsius et haeredum suorum Regum Angliae filiis primogenitis (*The Prince's Case*, 8 Co. Rep. 27a; 77 E.R. 513).

above and beyond all other lords of parliament, and before long, arrogated to themselves the exclusive right to be called peers, and as such the only persons entitled to the privileges of peerage.

In early parliamentary days it had been the custom to summon regularly to attend the Lords for deliberative purposes another body of men—the judges. Less important than the prelates, they also owed their summons to official position, and like them were eventually overshadowed by the hereditary principle. The force of hereditary right gave to ennobled blood a position never possessed by either judge or prelate. It is true the prelate, in point of antiquity, was senior to both earl and baron, and in many cases superior in extent of possessions; but these attributes belonged to his office, the resignation or deprivation of which would at any time have caused him to lose his writ of summons. The writ issued really to the office. The judge's position was even worse. His judicial office evoked the writ, but at any moment he might be deprived of that office at the arbitrary pleasure of the Crown. It is doubtful whether the judges ever had voice and vote in the same sense as the other lords of parliament, and even if they had they soon came to be regarded merely as counsellors and assessors.

The pretensions of the lay peers were not admitted without a struggle on the part of the prelates, who made the mistake of aiming at the establishment of a privileged position for their own order while endeavouring to retain every right possessed by their lay brethren. They fell between two stools, lost their position as peers, and were beaten back in their fight for ecclesiastical privilege. In the reign of Richard II. the prelates are found clearly defining their position. Neville, archbishop of York, de Vere, duke of Ireland and others, were "appealed" for treason, and the archbishop of Canterbury took the opportunity in parliament of making clear the rights of his order. He said "of right and by the custom of the realm of England it belongeth to the Archbishop of Canterbury for the time being as well as others his suffragans, brethren and fellow bishops, abbots and priors and other prelates whatsoever, holding of our lord the king by barony, to be present in person in all the king's parliaments whatsoever as Peers of the Realm aforesaid, and there with the other Peers of the Realm, and with other persons having the right to be there present, to advise, treat, ordain, establish, and determine as to the affairs of the realm and other matters there wont to be treated and to do all else which there presses to be done." After this he went on to say that as to the particular matters in question they intended to be present and to take their part in all matters brought before parliament "save our estate and order and that of each of the prelates in all things. But because in the present parliament there is question of certain matters, in which it is not lawful for us or anyone of the prelates according to the institute of the Holy Canons in any manner, to take part personally" we intend to retire "saving always the rights of our peerage" (*Rot. Parl.* 11 Rich. II. No. 6—printed iii. 236–237). At the desire of the prelates this statement of their rights was duly enrolled in parliament, but their claim to be peers was neither denied nor admitted, and the proceedings went on without them. For themselves Churchmen never claimed the privilege of trial by peers. Whenever they were arraigned they claimed to be altogether outside secular jurisdiction, and it was therefore a matter of small concern to them whether they were in the hands of peers or peasants. Such was the attitude of Becket towards Henry II. (Stubbs, *Const. Hist.* i. 504), of Archbishop Stratford towards Edward III. (Pike, pp. 188 seq.), and it was probably with the history of these two cases in his mind that the archbishop of Richard II.'s reign speaks of the saving rights of his order. These rights were never willingly admitted in England, and as the pope's power for interference waned so the prelates were forced under the ordinary law of the land. Henry VIII. certainly never regarded ecclesiastics as peers, as may be gathered from a grant early in his reign to the then abbot of Tavistock for himself and each succeeding abbot the right to be "one of the spiritual and religious lords of parliament." As to abbots, the subsequent dissolution of the monasteries put an end to the discussion. In this reign also Cranmer and Fisher, though the former was archbishop of Canterbury, were tried by a common jury, and they certainly claimed no privilege of peerage. The Standing Orders of the House of Lords for 1625 contain the statement that "Bishops are only Lords of Parliament and not Peers" (*Lords Journals*, iii. 349). In 1640 the "Lords Spiritual" were altogether excluded from the House of Lords by act of parliament, and were not brought back until the second year of the Restoration. From that period there has been no question as to their position. Peers and holders by barony when parliaments first met, by the end of the 15th century they had put themselves outside the pale of the peerage. To-day their ancient lands are vested in trustees (Ecclesiastical Commissioners), and office alone constitutes a bishop's qualification, and that only if he occupies one of the five great sees of Canterbury, York, London, Durham and Winchester, or is of sufficient seniority in appointment to fill one of the remaining twenty-one places on the bench of bishops in the house—for there are now only twenty-six seats for thirty-six prelates.

Henry VIII. and the Peerage.

The reign of Henry VIII. brought about far-reaching changes in the position of the peerage. When that king ascended the throne the hereditary element was in a decided minority, but the balance was gradually redressed until at length a bare hereditary majority was secured and the dissolution of the monasteries made possible. The peers, many now grown fat on abbey lands, at once began to consolidate their position; precedents were eagerly sought for, and the doctrine of ennobled blood began to find definite and vigorous expression. So long, the peers declared, as there is any ennobled blood, a peerage must exist; and it can be extinguished only by act of parliament, failure of heirs, or upon corruption of blood by attainder. Stubbs writes with some contempt of the doctrine (*Const. Hist.* iii. 458 n.), apparently on the ground that it is absurd to speak of ennobled blood so long as the children of a peer still remain commoners. The doctrine is neither unreasonable nor illogical. By it is meant blood in which there always exists a capacity to inherit a particular peerage, and every person in whose veins the ennobled blood runs is competent to occupy the peerage if the chances of nature should remove those who are senior to him in the line of descent. A good illustration is the popular use of the term "blood royal," which of course does not mean that an individual of the blood royal necessarily occupies a throne but that he or she is in the line of succession to it. Similarly, persons of "ennobled blood" are not necessarily peers but in the line of descent to peerages, to which they may or may not succeed. (See NOBILITY.)

Ennobled Blood.

The English peer is not like the continental noble the member of a caste, but the holder for life of an office clothed with high and exceptional legislative and judicial attributes entirely dependent on his office and exercisable only in conjunction with his fellow peers in parliament assembled. Such privileges as he possesses are due primarily to his office rather than to his blood. His children are commoners, who though accorded courtesy titles by the usage of society have no legal privileges not shared with the humblest of British subjects. It is this peculiar official quality of an English peerage which saved England from the curse of a privileged noble caste such as that which so long barred all progress in France and Germany. As a result there are hundreds of families in the United Kingdom who, commoners there, would yet, from their purity of blood, position and influence, be accounted noble in any continental country.

Surrender of Peerages.

From the doctrine of nobility of blood is derived the rule of law that no peerage (a Scots peerage is under Scots Law) can be surrendered, extinguished, or in any way got rid of unless the blood be corrupted. The rule is well illustrated by the earldom of Norfolk case (*Law Reports* [1907], A. C. 10) in which its development was traced, and the principle authoritatively confirmed. In 1302 the hereditary earldom of Norfolk (created in 1135) was in the possession of Hugh Bygod, one of the most powerful nobles of

Plantagenet days. The earl got into difficulties, and as some say, for a consideration, and others, to spite his brother and debtor, surrendered his earldom and all the lands thereto belonging, to King Edward I. from whom he subsequently received it back with an altered limitation to himself and the heirs of his body. As he was a childless old man this was practically a short life interest to the exclusion of all his relatives, the nearest of whom but for the surrender would have succeeded. Soon after Bygod died, and the earldom fell into the hands of Edward II. who granted it to his brother Thomas of Brotherton in 1312. Lord Mowbray, the lineal descendant of this Thomas, recently came forward and claimed the earldom, but in 1906 the House of Lords decided against his claim on the ground that in law Bygod's surrender was invalid, and that therefore Edward II. had no valid power to grant this particular earldom to Thomas of Brotherton. Historically there is little to support such a decision, and indeed this rigid application of the law is of comparatively recent date. Without doubt king, nobles and lawyers alike were all agreed, right down to Tudor days, that such surrenders were entirely valid. Many certainly were made, but, according to the decision of 1906, any living heirs of line of those nobles who thus got rid of their peerage honours can, if their pedigrees be provable, come to the House of Lords with a fair chance of reviving the ancient honours. Even as late as 1663 we find the Crown, naturally with the concurrence of its legal advisers, stating in the barony of Lucas patent (1663) that, on the appearance of co-heirs to a barony, the honour may be suspended or extinguished at the royal pleasure. The royal view of the law (at any rate as to extinction) was strongly objected to by the Lords, who guarded their privileges in Stuart days even more strictly than did the Commons. As early as 1626, in the celebrated dispute over the earldom of Oxford, the lord great chamberlainship and the baronies of Bolebec, Badlesmere and Sandford, Mr Justice Dodridge, who had been called in by the Lords to advise them, said that an earl could not give away or alien his inheritance, because it was "a personal dignity annexed to the posterity and fixed in the blood." Fourteen years later, in the Grey de Ruthyn case, the Lords solemnly resolved, "That no peer of the realm can drown or extinguish his honour (but that it descends unto his descendants), neither by surrender, grant, fine nor any other conveyance to the king." In 1678 the Lords became, if possible, even more definite, in view probably of the fact that the Crown had disregarded the Grey de Ruthyn resolution, having in 1660 taken into its hands, by surrender of Robert Villiers, 2nd viscount, the viscounty of Purbeck. In 1676 the son of the second viscount applied for his writ of summons, and on the advice of Sir William Jones, the attorney-general, who reported that "this (surrender) was a considerable question, never before resolved that he knew of," the king referred the whole matter to the Lords. The Lords were very explicit, being "unanimously of the opinion, and do resolve that no fine now levied, or at any time hereafter to be levied by the king, can bar such title of honour (*i.e.* of a peer of the realm), or the right of any person claiming under him that levied, or shall levy such fine." On these resolutions passed in the seventeenth century, the Lords of 1906 find illegal a surrender of 1302. The result seems strange, but it is, at any rate, logical from the legal point of view. It was urged that in 1302 no real parliament, in the sense applied to those of later years, was in existence; and consequently, a resolution founded on parliamentary principles should not apply. To this answer was made: Although it may be true that the law and practice of parliament had not then crystallized into the definite shape of even a hundred years later, the "Model Parliament" was summoned seven years before Bygod's surrender, and it is necessary to have some definite occurrence from which to date a legal beginning—a point of law with which an historian can have little sympathy.

Briefly, perhaps, from the teaching of the case it may be permissible to state the rule as follows: In early days the Norman and Plantagenet kings took upon themselves to deal with the barons in a manner which, though illegal, was suffered because no one dared oppose them; but as time went on, becoming stronger and more determined to enforce their privileges and exalt their order the peers were able to compel recognition of their rights, and their resolutions in Stuart days were only declaratory of law which had always existed, but had been systematically disregarded by the Crown. This being so, resolutions of the peers deliberately and expressly laid down must, when in point, always be followed.

Attainder and Corruption of Blood. The application of the doctrine of corruption of blood to peerages arises out of their close connexion with the tenure of land, peerage dignities never having been regarded as personal until well on into the 14th century. Conviction for any kind of felony—and treason originally was a form of felony—was always followed by attainder. This resulted in the immediate corruption of the blood of the offender, and its capacity for inheritance was lost for ever. Such corruption with all its consequences could be set aside only by act of parliament. This stringent rule of forfeiture was to some extent mitigated by the passing in 1285 of the statute De Donis Conditionalibus (Blackstone's *Commentaries*, ii. 116) which made possible the creation of estates tail. and when a tenant-in-tail was attainted forfeiture extended only to his life interest. The statute De Donis was soon applied by the judges to such dignities as were entailed (*e.g.* dignities conferred by patent with limitations in tail), but it never affected baronies by writ, which were not estates in tail but in the nature of estates in fee simple descendible to heirs general. In the reign of Henry VIII. an act was passed (1534) which brought estates tail within the law of forfeiture, but for high treason only. The position then became that peerages of any kind were forfeitable by attainder following on high treason, while baronies by writ remained as before forfeitable for attainder following on felony. In 1708, just after the Union with Scotland, an act was passed by which on the death of the Pretender and three years after Queen Anne's death the effects of corruption of blood consequent on attainder for high treason were to be abolished, and the actual offender only to be punished (stat. 7 Anne, c. 21, § 10). Owing to the 1745 rising, the operation of this act was postponed until the decease of the Pretender and all his sons (stat. 17 Geo. II. c. 39, s. 3). In 1814 forfeiture for every crime other than high and petty treason and murder was restricted to the lifetime of the person attainted (stat. 54 Geo. III. c. 145). Finally in 1870 forfeiture, except upon outlawry, was altogether abolished and it was provided that "no judgment of or for any treason or felony should cause any attainder or corruption of blood, or any forfeiture or escheat." The necessity for ascertaining the exact condition of the law with regard to attainder throughout the whole period of English parliamentary history will be realized when it is remembered that there still exist dormant and abeyant peerages dating from 1295 onwards which may at any time be the subject of claim before the House of Lords, and if any attainders exist in the history of such peerages the law governing their consequences is not the law as it exists to-day but as it existed when the attainder occurred. The dukedom of Atholl case of 1764 is interesting as showing the effect of attainder on a peerage where the person attainted does not actually succeed. John first duke of Atholl died in 1725 leaving two sons James and George. George the younger was attainted of treason in 1745 and died in 1760, leaving a son John. James, the second son of the first duke, who had succeeded his father in 1725 died in 1764 without issue. John his nephew then claimed the dukedom, and was allowed it on the ground that his father never having been in the possession of the dukedom his attainder could not bar his son, who succeeds by reason of his heirship to his uncle. It would have been otherwise had the younger son outlived his brother, for he would then have succeeded to the dukedom and so destroyed it by his attainder.

In many cases there have been passed special parliamentary acts of attainder and forfeiture, and these, of course, operate apart from the general law. In any event, attainder and forfeiture of a dignity, whether resulting from the rules of the common law or from special or general acts of parliament can

only be reversed by act of parliament. The procedure in reversing an attainder and recovering a dignity is as follows. The Crown signifies its pleasure that a bill of restoration shall be prepared and signs it. The bill is then brought in to the House of Lords, passed there, and sent to the Commons for assent. The last bills of the kind became law in 1876, when Earl Cowper procured the removal of the attainder on one of his Ormond ancestors and so by purging the blood of corruption became entitled to, and was allowed, the barony of Butler of Moore Park (created in 1663). There should also be noted the Earldom of Mar Restitution Act 1885, which, while mainly confirmatory of a disputed succession, at the same time reversed any attainders that existed.

The House of Lords grew steadily throughout the Tudor period, and during the reign of the first two Stuarts underwent a still greater increase. In the Great Rebellion the majority of the peers were the king's stoutest supporters and thus inevitably involved themselves in the ruin of the royal cause. Immediately after the execution of Charles I. the Republicans proceeded to sweep away everything which savoured of monarchy and aristocracy. The House of Commons voted the Lords "useless and dangerous," got rid of them as a part of parliament by the simple expedient of a resolution (*Comms. Journs.* 1648-1649, vi. 111) and placed the sole executive power in Cromwell's hands, but there was no direct abolition of the peerage as such. Evidently it took Cromwell but little time to realize the fallacy, in practice, of single-chamber government, as he is found ten years after the "useless and dangerous" resolution busy establishing a second chamber.[1] What to call it aroused much discussion, and eventually the unruly Commons consented to speak of and deal with "the other house." It is very difficult to realize what was the constitution of this body, so short was its life and so contemptuous its treatment by the Commons. The members of "the other house" were summoned by writs under the Great Seal, similar in form to those used to summon peers of past days. Some sixty writs were issued, and presumably their recipients were entitled thereby to sit for the duration of the parliament to which they were summoned; but it may be considered as certain that Cromwell's lords were never regarded as hereditary peers. They were entitled to the courtesy appellation "Lord" and appear to have been in the main substantial men—existing peers, judges, distinguished lawyers and members of well-known county families. Judging from Cromwell's speech at the opening of parliament, and subsequent entries in Whitelock's diaries, the new house appears to have had revising functions both of a legislative and judicial nature and also the duty of taking cognisance of foreign affairs. Cromwell certainly issued two patents of hereditary peerage—the barony of Burnell and the barony of Gilsland (with which went the viscounty of Howard of Morpeth), but neither title was recognized on the Restoration, and it does not appear that the possession of these titles ever conferred on their holders any hereditary right to a writ of summons to sit in the "other house." Whitelock himself was promised a viscounty by Cromwell, but no patent ever appears to have passed the Great Seal. Eventually business between the two houses grew impossible, and Cromwell was compelled to dissolve parliament. Richard's first parliament also contained Lords as well as Commons, the latter considerately voting "to transact business with the persons sitting in the other house as an House of Parliament, saving the right of the peers who had been faithful to the parliament," the saving clause evidently a loophole for the future. The dissolution of this parliament and the retirement of the protector Richard into private life preceded by only a few months the restoration to the throne of Charles II. With the king the peers returned to their ancient places.

Commonwealth Abolition of the Lords.

Cromwell's House of Lords.

From the reign of William of Orange the peerage has been freshened by a steady stream of men who as a rule have served their country as statesmen, lawyers and soldiers. Little of note occurred in the history of the peerage until the reign of Anne. By the Act of Union with Scotland (1707) the Scottish parliament was abolished; but the Scottish peerage were given the privilege of electing, for each parliament of Great Britain, sixteen of their number to represent them in the House of Lords. Further creations in the Scottish peerage were no longer to be made. The effect of this act was to leave the great majority of the Scottish peers outside the House of Lords, as only sixteen of their number were to become lords of parliament. Close upon a hundred years later Ireland was united with Great Britain, the Irish parliament being merged in the parliament of the United Kingdom of Great Britain and Ireland. Twenty-eight Irish peers were to be elected for life by their order to represent it in the House of Lords. One archbishop and three bishops were also chosen in turn to represent the Irish Church in the House of Lords, but when that Church was disestablished in 1867 the spiritual lords lost their seats. The merger of the three kingdoms had an important effect on their peerages. Every peer in his own country had been a lord of parliament by hereditary right. The English peer (and, as the Acts of Union were passed, the peer of Great Britain and the peer of the United Kingdom) continued by hereditary right a lord of parliament. The Scottish and Irish peers lost this right though by the two Acts of Union they retained every other privilege of peerage. Henceforth they were lords of parliament only as and when their fellow peers elected them. Thus though not all were lords of parliament *in esse*, every one was always so *in posse*, and in any case it was the hereditary quality of the peerage which either actually seated its holder in the House of Lords or made it possible for him to get there by the votes of his fellows.

Scottish Representative Peers.

Irish Representative Peers.

It now becomes possible to arrive at the modern meaning of the term "a peerage," and we may define it as a dignity of England, Scotland or Ireland, which, by its hereditary quality, confers on its holder for the time being the right to be or to be elected a lord of parliament. The term "peerage" is also used in a collective sense.

Modern Meaning of "Peerage."

The reign of Anne is remarkable for an attempt made by the House of Lords to limit its numbers by law. The queen, in order to secure a majority for the court party, had created a batch of twelve peers at one time, a considerable number in relation to existing peerages; and it was feared this expedient might be used as a precedent. A peerage limitation bill was introduced into the House of Lords in 1719. Six new creations were to be allowed, but after these the Crown, except in the case of royal princes, was to create a new peerage only when an old one became extinct. Twenty-five hereditary peerages in Scotland were to take the place of the sixteen representative peers for all time. The bill passed the Lords, but was eventually thrown out in the House of Commons, though not by an overwhelming majority.

Queen Anne and Peerage Limitation.

In 1856 it was desired to strengthen the judicial element in the House of Lords, and the Crown issued letters patent creating Sir James Parke, one of the barons of the exchequer, Baron Wensleydale and a peer "for and during the term of his natural life." The burden of an hereditary peerage is heavy, and many men thoroughly well qualified in legal attainments have been known to refuse it on the ground of expense alone. This life-peerage was thought to be a way out of the difficulty, and it was on Lord Chancellor Cranworth's advice that the Crown issued the Wensleydale patent. The House of Lords at once realized that the creation of life-peers, at the will of the ministry of the day, might put the hereditary section into an absolute minority, and possibly in time, by form of law, get rid of it altogether. Eventually it was decided by the house that "neither the said letters patent nor the said letters patent with the usual writ of summons enable the grantee to sit and vote in parliament," a formal resolution which closed the door in the face of every

Wensleydale Case.

[1] Whitelock's *Memorials of English Affairs* (in the reign of Charles I. and up to the Restoration) (1853, ed. iv. 313).

person whom the Crown might endeavour to make a life-peer. The government of the day accepted the situation, and soon afterwards a new patent was made out which followed the usual limitation to heirs-male. The precedents in favour of the Crown's action were not strong. The essential and outstanding attribute of the house was its hereditary character. The whole balance of the constitution worked on the pivot of the independence of the peers. They existed as a moderating force in the counsels of parliament, and the alteration of the hereditary character of the House of Lords might easily have rendered it amenable to whatever pressure the government of the day might see fit to exercise. In such circumstances its position as arbiter between people and government would tend to disappear. A change fraught with so many serious possibilities ought not, it was said, to be made by the simple prerogative of the Crown. If so far-reaching an alteration in the law were justifiable it was for parliament to make it. Further, it was pointed out, there had been no life-creations for centuries, and those that are recorded to have been conferred since the crystallization of our parliamentary system were of such a nature that the grantees never sat in the house by virtue of their life-honours, inasmuch as they were existing peers or women. Soon after the Wensleydale debates the government introduced a bill into the House of Lords to authorize the creation of two life-peers, who were to be persons of at least five years' standing as judges. They were to sit as lords of appeal but to be peers for life. Eventually the bill disappeared in the House of Commons. In 1869 Earl Russell introduced another life-peerage bill of far wider scope. Twenty-eight life-peerages might be in existence at any one time, but not more than four were to be created in any one year. The life peers would be lords of parliament for life. They were to be selected by the Crown from the peerages of Scotland and Ireland, persons who had sat for ten years in the Commons, distinguished soldiers, sailors, civil servants and judges or persons distinguished in science, literature or art. The bill received a rough handling in committee of the Lords, and the time was evidently not ripe for change, as the bill failed to pass its third reading.

Judicial Peers.

In 1870 attempts were made in the House of Lords to alter the position of the Scottish and Irish representative peers. In 1876 the need of further judicial strength in the Lords was tardily admitted, and an act was passed authorizing the creation of two lords of appeal in ordinary, and power was reserved to appoint two more as certain judicial vacancies occurred. They were to be entitled to the rank of baron during their lives but were to sit and vote in parliament only so long as they held their judicial office. Their dignities lasted for life only. Eleven years later another act enabled all retired lords of appeal to sit and vote as members of the House of Lords for life. To those interested in House of Lords reform the pages of *Hansard's Parliamentary Debates* are the best authority. In 1888 reform bills were introduced by Lords Dunraven and Salisbury, and in 1907 by Lord Newton. In December 1908 the publication of a long report with sweeping recommendations for reform ended the labours of a House of Lords committee which had been appointed to consider the question in detail. In the session of 1910, following the general election, long discussions took place in both houses of parliament. Opinion generally was freely expressed that the time had arrived for diminishing the number of lords of parliament and for putting into practice the principle that hereditary right alone should no longer confer lordship of parliament. (See PARLIAMENT.)

Suggested Reforms and Alterations.

The Scottish peerage, like that of England, owes its origin to feudalism. In Anglo-Norman days Scotland was a small country, and for some generations after England was settled the Scottish king's writ ran little beyond the foot of the Highlands, and even the Lord of the Isles reckoned himself an independent sovereign until the beginning of the 15th century. The weak and usually ineffective control of the Crown resulted in opportunities for acquiring personal power which the nobles were not slow to take advantage of. Seldom accustomed to act in concert, they soon developed particularist tendencies which steadily increased the strength of their territorial position. These conditions of existence were entirely unfavourable to the establishment of any system of parliamentary government such as centralization had made possible in England, therefore it is not surprising to find that the lesser barons were not relieved of their attendance at the national assemblies until well on in the 15th century (Burton's *Scotland*, iii. 111). Again, when the Scottish earls and barons came to parliament, they did not withdraw themselves from the rest of the people, it being the custom for the estates of Scotland to deliberate together, and this custom persisted until the abolition of their parliament by the Act of Union in 1707. The territorial spirit of the nobles inevitably led them to regard the honour as belonging to, and inseparable from, their land, and until comparatively late in Scottish history there is nowhere any record of the conferment of a personal dignity unattached to land such as that conferred in England on Beauchamp by Richard II. This explains the frequent surrenders and altered grants which are so common in Scottish peerage history, and which, in sharp distinction to the English rule of law, are there regarded as perfectly legal. To-day there exists no Scottish dukedom (except the royal dukedom of Rothesay), marquessate or viscounty created before the reign of James VI. of Scotland (and I. of England). Of the existing Scottish peerages sixty-three were created in the period between James's accession to the English throne and the Act of Union. There are now only eighty-seven in all. Unlike one of the English peerages owing its origin exclusively to a writ of summons, ancient Scottish peerages do not fall into abeyance, and when there are only heirs-general, the eldest heir of line succeeds.

Scottish Peerage.

Whenever a new parliament is summoned, proclamation is made in Scotland summoning the peers to meet at Holyrood to elect sixteen of their number to represent them in such parliament. The Scottish peerages are recorded on a roll, and this is called over by the lord clerk register before the assembled peers seated at a long table. Each peer answers to the name of the peerage (it may be one or more) he possesses. The roll is then read again and each peer in turn (but only once) rises and reads out the list of those sixteen peers for whom he votes. Proxies are allowed for absent peers and are handed in after the second roll-call. The votes are counted and the lord clerk register reads out the names of those elected, makes a return, and signs and seals it in the presence of the peers assembled. The return eventually finds its way to the House of Lords. The Scottish representative peer so elected receives no writ of summons to parliament, but attends the House of Lords to take the oath, his right to sit being evidenced by the return made. It might be thought that the rules of election in so important a matter would be more stringent, but the fact remains that it is quite possible for an entirely unqualified person to attend and vote at Holyrood. No evidence of identity or of a man's right to be present is required and the lord clerk register is compelled to receive any vote tendered except in respect of peerages for which no vote has been given since 1800, these being struck off the roll (10 & 11 Vict. c. 52). Any person claiming to represent such a peerage must prove his right before the House of Lords, as was done in the case of the barony of Fairfax in 1908. It is true that by the act last cited any two peers may protest against a vote at Holyrood, and the lord clerk register thereupon reports the proceedings to the House of Lords, who will consider the question if application be made for an inquiry, but nothing is done unless an application is made. The right to vote certainly needs better proof than that now accepted. For many years the House of Lords maintained that the Crown could not confer a new peerage of Great Britain on a Scottish peer, the ground being that the Scottish peerage was only entitled to the sixteen representative peers given it by the Act of Union, but eventually in 1782 in the case of the duke of Hamilton this contention was given up.

The Anglo-Norman conquerors of Ireland carried with them the laws and the system of tenure to which they were accustomed

in England, and consequently the growth of the baronage and the establishment of parliamentary government in Ireland

Irish Peerage

proceeded on parallel lines with the changes which occurred in England. Until the reign of Henry VIII. the Irish were without representation in parliament, but gradually the Irish were admitted, and by the creation of new parliamentary counties and boroughs were enabled to elect representatives. In 1613 the whole country shared in representation (Ball's *Legislative Systems of Ireland*). Just as James I. had added many members to the Scottish peerage, so he increased the number of Irish peers.

In 1800 the Union of Great Britain and Ireland abolished the parliament of Ireland. By the Act of Union the Irish peers became entitled to elect twenty-eight of their number to represent them in the House of Lords. The election is for life, and only those peers are entitled to vote at elections of representative peers who have proved their right of succession to the satisfaction of the lord chancellor, who issues his notice to that effect after each individual proof. The names of such peers are added to the voting-roll of the peerage, and when voting papers are distributed—the Irish peers do not meet for election purposes as do those of Scotland—they are sent only to those peers who have proved their right to vote. If any claim to the right to vote is rejected by the lord chancellor the claimant must prove his case before the Committee for Privileges (barony of Graves, 1907). When an Irish peer has been elected a representative peer he receives, as a matter of course, a writ of summons at the beginning of each parliament. The great bulk of the Irish peerage owes its existence to creations during the last two centuries, only seven of the existing peerages dating back beyond the 17th century; of the rest twenty-two were created during the year of Union, and thirty-three have been added since that date. Some hundred or more years ago ministers found the Irish peerage a useful means of political reward, in that it was possible to bestow a title of honour, with all its social prestige, and yet not to increase the numbers of the House of Lords.

On the death of a representative peer of Scotland or Ireland a vacancy occurs and a new election takes place, but in accordance with modern practice promotion to a United Kingdom peerage does not vacate the holder's representative position (May's *Parliamentary Practice*, p. 11 n.). Scottish and Irish peers, if representative, possess all the privileges of peerage and parliament enjoyed by peers of the United Kingdom; if non-representative all privileges of peerage, except the right to a writ of summons to attend parliament and to be present at and vote in the trial of peers. A Scottish peer, if non-representative, is in the anomalous position of being disabled from serving his country in either house of parliament, but an Irish peer may sit for any House of Commons constituency out of Ireland, though while a member of the Commons his peerage privileges abate.

Though many peers possess more than one peerage, and frequently of more than one country, only that title is publicly used which is first in point of precedence. It was once argued that whenever a barony by writ came into the possession of a person already a peer of higher rank, the higher peerage "attracted" or overshadowed the lower, which thenceforth followed the course of descent of the dignity which had attracted it. This doctrine is now exploded and cannot be regarded as applying to any case except that of the Crown (*Baronies of Fitzwalter*, 1660, and *De Ros*, 1666; Collins's *Claims*, 168, 261). Every peerage descends according to the limitations prescribed in its patent of creation or its charter, and where these are non-existent (as in the case of baronies by writ) to heirs-general. (See ABEYANCE.)

In dealing with English dignities it is essential to realize the difference between a mere title of honour and a peerage. The Crown as the fountain of honour is capable of conferring upon a subject not only any existing title of honour, but may even invent one for the purpose. So James I. instituted an order of hereditary knights which he termed baronets, and Edward VII. created the duchess of Fife "Princess Royal"—a life dignity. The dignities of prince of Wales earl marshal and lord great chamberlain have been for centuries hereditary, and though of high court and social precedence, of themselves confer no right to a seat in the House of Lords—they are not peerages.

Creations must be according to Law.

The grant of a peerage is a very different matter; its holder becomes thereby a member of the Upper House of Parliament, and therefore the prerogative of the Crown in creating such an office of honour must be exercised strictly in accordance with the law of the land. The Crown's prerogative is limited in several directions. The course of descent must be known to the law; and so, in the first place, it follows that a peer cannot be created for life with a denial of succession to his descendants (unless it be as one of the lords of appeal in ordinary under the acts of 1876 and 1887). The courses of descent of modern patents are invariably so marked out as ultimately to fix the peerage is some male line according to the custom of primogeniture, though the immediate successor of the first holder may be a woman or even a stranger in blood. The following instances may be cited: Amabell, Baroness Lucas, was in 1816 created Countess de Grey with a limitation to the heirs-male of her sister; a nephew afterwards succeeded her and the earldom is now held by the marquess of Ripon. Other courses of descent known to the law are as follows: Fee simple, which probably operates as if to heirs-general, earldoms of Oxford (1155) and Norfolk (1135), both probably now in abeyance; and Bedford (1367), extinct; to a second son, the eldest being alive, dukedom of Dover (1708), extinct, and earldom of Cromartie (1861) called out of abeyance in 1895; a son-in-law and his heirs-male by the daughter of the first grantee, earldom of Northumberland (1747), to an elder daughter and her heirs-male, earldom of Roberts (1901); to an elder or younger brother and his heirs-male, viscounty of Kitchener (1902) and barony of Grimthorpe (1886). It is, however, not lawful for the Crown to make what is called a shifting limitation to a peerage, *i.e.* one which might vest a peerage in an individual, and then on a certain event happening (*e.g.* his succession to a peerage of higher rank) shift it from him to the representative of some other line. Such a limitation was held illegal in the Buckhurst case (1864). A peerage may not be limited to the grantee and "his heirs-male for ever." Such a grant was that of the earldom of Wiltes in 1398. The original grantee died without issue, but left a male heir-at-law, whose descendants in 1869 claimed the earldom, but the original limitation was held invalid.

There is no limitation on the power of the Crown as to the number of United Kingdom peerages which may be created. As to Scotland, the Act of Union with that country operates to prevent any increase in the number of Scottish peerages, and consequently there have been no creations since 1707, with the result that the Scottish peerage, as a separate order, is gradually approaching extinction. The Irish peerage is supposed always to consist of one hundred exclusively Irish peers, and the Crown has power to grant Irish peerages up to the limit. When the limit is reached no more peerages may be granted until existing ones becomes extinct or their holders succeed to United Kingdom peerages. Only four lords of appeal in ordinary may hold office at any one time. The number of archbishops and bishops capable of sitting in the House of Lords is fixed by various statutes at twenty-six, but, as pointed out previously, the spiritual lords are not now regarded as peers.

Growth in Numbers.

Since party government became the rule, new peerages have usually been created on the recommendation of the prime minister of the day, though the Crown, especially in considering the claims of royal blood, is believed in some instances to take its own course; and constitutionally such action is entirely legal. By far the greater number of peerage honours granted during the last two centuries have been rewards for political services. Usually these services are well known, but there exist several instances in which the reasons for conferring the honour have not been quite clear. Until the reign of George III. the peerage was

comparatively small, but that monarch issued no fewer than 388 patents of peerage. Many of these have become extinct or obscured by higher titles, but the general tendency is in the direction of a steady increase, and where the peers of Tudor times might be counted by tens their successors of 1910 were numbered in hundreds. The full body would be 546 English peers. There are also 12 ladies holding English peerages. The Irish peerage has 175 members, but 82 of these are also peers of the United Kingdom, leaving 28 representative and 65 without seats in the House of Lords. Of 87 Scottish peers 51 hold United Kingdom peerages, the remainder consisting of 16 representative and 20 without seats.

Privileges of Peerage. As centuries have gone by and customs changed, many privileges once keenly asserted have either dropped out of use or been forgotten. The most important now in being are a seat in the House of Lords and the right to trial by peers. The right to a seat in parliament is one sanctioned by centuries of constitutional usage. The right of a peer in England to a seat in parliament was not, as pointed out in the early part of this article, entirely admitted by the Crown until late in the Plantagenet period, the king's pleasure as to whom he should summon always having been a very material factor in the question. Charles I. made a deliberate attempt to recover the ancient discretion of the Crown in the issue of writs of summons. The earl of Bristol was the subject of certain treasonable charges, and though he was never put on his trial the king directed that his writ of summons should not issue. The excluded peer petitioned the Lords, as for a breach of privilege, and a committee to whom the matter was referred reported that there was no instance on record in which a peer capable of sitting in parliament had been refused his writ. There was a little delay, but the king eventually gave in, and the earl had his writ (*Lords Journals*, iii. 544).

At the beginning of a new parliament every peer entitled receives a writ of summons issued under the authority of the Great Seal; he presents his writ at the table of the House of Lords on his first attendance, and before taking the oath. If the peer be newly created he presents his letters-patent creating the peerage to the lord chancellor on the woolsack, together with the writ of summons which the patent has evoked. A peer on succession presents his writ in the ordinary way, the *Journals* recording, *e.g.* that Thomas Walter, Viscount Hampden, sat first in Parliament after the death of his father (*Lords Journals*, cxxxix. 4). The form of writ now issued (at the beginning of a parliament: for the variation when parliament is sitting see *Lords Journals*, cxxxix. 185) corresponds closely to that in use so long ago as the 14th century. It runs as follows:—

> George the Fifth by the Grace of God of the United Kingdom of Great Britain and Ireland and of the British Dominions beyond the seas King Defender of the Faith to our right trusty and well-beloved Greeting Whereas by the advice and consent of our Council for certain arduous and urgent affairs concerning us the state and the defence of our said United Kingdom and the Church we have ordered a certain Parliament to be holden at our City of Westminster on the . . . day of . . . next ensuing and there to treat and have conference with the prelates great men and peers of our realm We strictly enjoining command you upon the faith and allegiance by which you are bound to us that the weightiness of the said affairs and imminent perils considered (waiving all excuses) you be at the said day and place personally present with us and with the said prelates great men and peers to treat and give your counsel upon the affairs aforesaid. And this as you regard us and our honour and the safety and defence of the said United Kingdom and Church and despatch of the said affairs in no wise do you omit.

Formerly all peers were required to attend parliament, and there are numerous recorded instances of special grants of leave of absence, but nowadays there is no compulsion.

Peers Tried by Peers. After the right to a summons the principal privilege possessed by a peer is his right to be tried by his peers on a charge of treason or felony. Whatever the origin of this right, and some writers date it back to Saxon times (Trial of Lord Morley, 1678, *State Trials* vii. 145), Magna Carta has always been regarded as its confirmatory authority. The important words are:—

> "nullus liber homo capiatur imprisonetur aut disseisiatur de libero tenemento suo vel libertatibus seu liberis consuetudinibus suis, aut utlagetur aut exuletur nec aliquo modo distruatur nec dominus rex super ipsum ibit nec super eum mittet nisi per legale *judicium parium suorum* vel per legem terrae."

The peers have always strongly insisted on this privilege of trial by their own order, and several times the heirs of those wrongly condemned recovered their rights and heritage on the ground that there had been no proper trial by peers (*R.D.P.*, v. 24). In 1442 the privilege received parliamentary confirmation (stat. 20 Henry VI. c. 9). If parliament is sitting the trial takes place before the House of Lords in full session, *i.e.* the court of our lord the king in parliament, if not then before the court of the lord high steward. The office of lord high steward was formerly hereditary, but has not been so for centuries and is now only granted *pro hac vice*. When necessity arises the Crown issues a special commission naming some peer (usually the lord chancellor) lord high steward *pro hac vice* (Blackstone's *Comm.* iv. 258). When a trial takes place in full parliament a lord high steward is also appointed, but his powers there are confined to the presidency of the court, all the peers sitting as judges of law as well as of fact. Should the lord high steward be sitting as a court out of parliament he summons a number of peers to attend as a jury, but rules alone on all points of law and practice, the peers present being judges of fact only. Whichever kind of trial is in progress it is the invariable practice to summon all the judges to attend and advise on points of law. The distinction between the two tribunals was fully discussed and recognized in 1760 (Trial of Earl Ferrers, Foster's *Criminal Cases*, 139). The most recent trial was that of Earl Russell for bigamy (reported 1901, A.C. 446). Among others are the Kilmarnock, Cromarty and Balmerino treason trials in parliament in 1746 (*State Trials* xviii. 441), and in the court of the lord high steward, Lord Morley (treason, 1666, *State Trials* vi. 777), Lord Cornwallis (murder, 1678 *State Trials* vii. 145), Lord Delamere (1686, treason, *State Trials* xi. 510). Recently some doubt has been expressed as to the origin of the court of the lord high steward. It is said that the historical document upon which the practice is founded is a forgery. The conflicting views are set forth in Vernon Harcourt's *His Grace the Steward and Trial of Peers*, p. 429, and in Pike's *Constitutional History of the House of Lords*, p. 213. In any case, whatever its historical origin, the court for centuries as a matter of fact has received full legal recognition as part of the constitution. The right to trial by peers extends only to cases of treason and felony, and not to those of misdemeanour; nor can it be waived by any peer (Co. 3 Inst. 29; Kelyng's Rep. 56). In the case of *R.* v. *Lord Graves* (1887), discussed in *Hansard's Parliamentary Debates*, 3rd series, vol. cccx. p. 246, Lord Halsbury points out that the question of trial by peers is one of jurisdiction established by law rather than a claim of privilege in the discretion of the accused. Scottish and Irish peers, whether possessing seats in the House of Lords or not, are entitled to trial by peers, the same procedure being followed as in the case of members of the House of Lords.

Peers with a seat in the House of Lords possess practically the same parliamentary privileges as do members of the House of Commons. Among other privileges peculiar to themselves they have the right of personal access to the sovereign (Anson's *Law of the Constitution*, i. 227). In the House of Lords, when a resolution is passed contrary to his sentiments, any peer, by leave of the house, may "protest," that is, enter his dissent on the journals of the house (Blackstone, *Comm.* i. 162). Formerly a peer might vote by proxy (Blackstone, ibid.), but since 1868 there has been a standing order discontinuing this right. In accordance with resolutions passed by the two houses, neither house has power by any vote or declaration to clothe itself with new privileges unknown to the law and customs of parliament (*Commons Journal*, xiv. 555). Peeresses and non-representative peers of Ireland and Scotland have,

with the exception of the right to sit in the House of Lords and its attendant parliamentary privileges, every peerage privilege: a widowed peeress retains her privilege of peerage while unmarried, but loses it if she marries a commoner (Co. Litt. 166; *Cowley* v. *Cowley* [1901] A.C. 450). Dissolution of marriage probably deprives a peeress of all peerage privileges which she acquired by marriage.

Position of Families of Peers. The children of peers are commoners. The eldest son of a peer of the rank of earl (and above) is usually known socially by the name of his father's next peerage, but the courtesy nature of such title is clearly indicated in every public or legal document, the phraseology employed being "John Smith, Esq., commonly known as Viscount Blackacre." Several cases are on record in which peers' eldest sons have actually borne courtesy titles not possessed as peerage honours by their fathers, but inasmuch as such are only accorded by courtesy, no question of peerage privilege arises. The younger sons of dukes and marquesses are entitled to the prefix "Lord" before their Christian names, and all the daughters of earls as well as of dukes and marquesses are entitled similarly to style themselves "Lady," on the principle that all the daughters are equal in rank and precedence. The younger sons of earls and all the younger children of viscounts and barons are entitled to the prefix "Honourable." Usually when the direct heir of a peer dies his children are given, by the Crown, on the death of the peer, the courtesy titles and precedence they would have enjoyed had their father actually succeeded to the peerage.

Creation of Peerages. An alien may be created a peer, but while remaining an alien cannot sit in the House of Lords, nor, if a Scottish or Irish peer, can he vote at elections for representative peers. Peerages may be created (1) by writ of summons, (2) by patent. The writ of summons method is not now used except in the case of calling up an eldest son in the barony of his father. This does not create a new peerage but only accelerates the heir's appearance in the House of Lords. On the father's death the peerage remains vested in the son. Should the son die without heir the peerage revests in the father. The invariable method of creation in all ordinary cases is by patent. The letters patent describe the name of the dignity, the person upon whom it is conferred, and specify its course of descent.

Claims to Peerages. Claims to peerages are of two kinds: (1) of right, (2) of grace. In theory the Crown, as the fountain of honour, might settle any claim without reference to the House of Lords and issue a writ of summons to its petitioner. This would not in any way prevent the House of Lords from examining the patent and writ of summons when the favoured petitioner or any heir claiming through him came to take his seat. If of opinion that the patent was illegal the house might refuse admittance, as it did in the Wensleydale case. In the case of a petitioner who has persuaded the Crown to terminate in his favour as a co-heir the abeyance of an ancient barony and who has received his writ of summons, the matter is more difficult. The house cannot refuse to admit any person properly summoned by the Crown, as the prerogative is unlimited in point of numbers; but it can take into account the precedence of the newcomer. If he has an old barony he naturally expects its proper place on the bench of barons; but if the house thought fit they might compel him to prove his pedigree before according any precedence. If he refused to do this they would still be bound to admit him, but it would be as the junior baron of the house with a peerage dating, for parliamentary purposes, from the day of his summons. The general result is that the Crown, unless there can be no question as to pedigree, seldom terminates an abeyance without referring the matter to the House of Lords, and invariably so refers all claims which are disputed or which involve any question of law.[1] The procedure is as follows: The claimant petitions the Crown through the home secretary, setting forth his pedigree and stating the nature of his claim. The Crown then refers the petition to its legal adviser, the attorney-general. The petitioner then in course of time appears before the attorney-general with his proofs. Finally the attorney-general reports that a prima facie case is, or is not, made out. If a case be made out, the Crown, if it does not take immediate action, refers the whole matter to the House of Lords, who pass it on to their Committee for Privileges for examination and report.

Committee for Privileges. The Committee for Privileges, which for peerage claims is usually constituted of the law lords and one or two other lords interested in peerage history, sits as an ordinary court of justice and follows all the rules of law and evidence. The attorney-general attends as adviser to the committee and to watch the interests of the Crown. According to the nature of the case the Committee reports to the house, and the house to the Crown, that the petitioner (if successful) (1) has made out his claim and is entitled to a writ of summons, or (2) has proved his co-heirship to an existing peerage, and has also proved the descent of all existing co-heirs. In the first case the writ of summons is issued forthwith, but the second, being one of abeyance, is a matter for the pleasure of the Crown, which need not be exercised at all, but, if exercised, may terminate the abeyance in favour of any one of the co-heirs. The seniority of a co-heir (though this alone is of little moment), his power to support the dignity, and the number of existing co-heirs, are all factors which count in the chances of success.

Peers of France. Reference has already been made in the earlier part of this article to the reply of Bishop Peter de Roches to the English barons who claimed trial by their peers, and, as was suggested the bishop probably had in his mind the peers of France. Possibly the word *pares*, as eventually used in England, was borrowed from this source, but this is uncertain. The great men known originally as the twelve pairs de France, were the feudal holders of large territories under the nominal sway of the king of France. They were the (archbishop) duke of Rheims, the (bishop) dukes of Langres and Laon, the (bishop) counts of Beauvais, Noyon and Chalons, the dukes of Burgundy, Normandy and Aquitaine, and the counts of Flanders, Toulouse and Champagne. These magnates, nominally feudatories, were practically independent rulers, and their position can in no way be compared to that of the English baronage. It is said that this body of peers was instituted in the reign of Philip Augustus, though some writers even ascribe its origin to Charlemagne. Some of the peers were present at Philip's coronation in 1179, and later again at the alleged trial of John of England when his fief of Normandy was adjudged forfeit to the French crown.

As the central power of the French kings grew, the various fiefs lost their independence and became united to the Crown, with the exception of Flanders which passed into the hands of the emperor Charles V. In the 14th century the custom arose for the sovereign to honour his more important nobles by granting them the title of Peer of France. At first the grant was confined to the royal dukes, but later it was conferred on others, amongst whom late in the 17th century appears the archbishop of Paris. To several counties and baronies the honour of a peerage was added, but most of these eventually became reunited with the Crown. As a legislative body a chamber of peers in France was first founded by Louis XVIII. in 1814; it was hereditary and modelled on the English House of Lords. The revolution of 1830 reduced its hereditary quality to life tenure, and in the troubles of 1848 the chamber itself finally disappeared.

Other Peerages. Austria, Hungary and Portugal are other countries possessing peerages which to some extent follow the English model. In Austria there is a large hereditary nobility and those members of it in whose families the legislative dignity is hereditary by nomination of the emperor sit in the Herrenhaus or Austrian Upper Chamber, together with certain prelates and a large number of nominated life-members. In Hungary all those nobles who possess the right of hereditary peerage (as admitted by the act of 1885 and subsequent acts) and who pay a land tax of certain value, are members of the House of Magnates, of which they form a large majority, the remainder of the members being Roman Catholic prelates, representatives of Protestant churches and life peers. In Portugal until recent years the House of Peers was an hereditary body, but it is now practically a chamber of life-peers. (G. E.*)

PEERLKAMP, PETRUS HOFMAN (1786–1865), Dutch classical scholar and critic, descended from a family of French refugees named Perlechamp, was born at Groningen on the 2nd of February 1786. He was professor of ancient literature and universal history at Leiden from 1822 to 1849, when he resigned his post and retired to Hilversum near Utrecht, where he died on the 27th of March 1865. He was the founder of the subjective method of textual criticism, which consisted in rejecting in a classical author whatever failed to come up to the standard of what that author, in the critic's opinion, ought to have written. His ingenuity in this direction, in which he went much farther than Bentley, was chiefly exercised on the *Odes* of Horace (th greater part of which he declared spurious), and the *Aeneid* of Virgil. He also edited the *Ars poetica* and *Satires* of Horace, the *Agricola* of Tacitus, the romance of Xenophon of Ephesus, and was the author of a history of the Latin poets of the Netherlands (*De vita, doctrina, et facultate Nederlandorum qui carmina latina composuerunt*, 1838).

See L. Müller, *Gesch. der klassischen Philologie in den Niederlanden* (1869), and J. E. Sandys, *Hist. of Class. Schol.* (1908), iii. 276.

PEESEMSKY, ALEXEY FEOFILACTOVICH (1820–1881), Russian novelist, was born on his father's estate, in the province of Kostroma, on the 10th/22nd of March 1820. In his autobiography he describes his family as belonging to the ancient

[1] This was not done in the case of the earldom of Cromartie called out of abeyance in 1895. The holder of the title being a lady the house has had, as yet, no opportunity of considering the validity of the Crown's action.

Russian nobility, but his more immediate progenitors were all very poor, and unable to read or write. His grandfather ploughed the fields as a simple peasant, and his father, as Peesemsky himself said, was washed and clothed by a rich relative, and placed as a soldier in the army, from which he retired as a major after thirty years' service. During childhood Peesemsky read eagerly the translated works of Walter Scott and Victor Hugo, and later those of Shakespeare, Schiller, Goethe, Rousseau, Voltaire and George Sand. From the gymnasium of Kostroma he passed through Moscow University, and in 1884 entered the government service as a clerk in the office of the Crown domains in his native province. Between 1854 and 1872, when he finally quitted the civil service, he occupied similar posts in St Petersburg and Moscow. His early works exhibit a profound disbelief in the higher qualities of humanity, and a disdain for the other sex, although he appears to have been attached to a particularly devoted and sensible wife. His first novel, *Boyarstchina*, was forbidden for its unflattering description of the Russian nobility. His principal novels are *Tufak* ("A Muff"), 1850: *Teesicha doush* ("A Thousand Souls"), 1862, which is considered his best work of the kind; and *Vzbalomoucheneoe more* ("A Troubled Sea"), giving a picture of the excited state of Russian society about the year 1862. He also produced a comedy, *Gorkaya soudbina* ("A Bitter Fate"), depicting the dark sides of the Russian peasantry, which obtained for him the Ouvaroff prize of the Russian Academy. In 1856 he was sent, together with other literary men, to report on the ethnographical and commercial condition of the Russian interior, his particular field of inquiry having been Astrakhan and the region of the Caspian Sea. His scepticism in regard to the liberal reforms of the 'sixties made him very unpopular among the more progressive writers of that time. He died at Moscow on the 2nd of February 1881 (Jan. 21, Russian style).

PEGASUS (from Gr. πηγός, compact, strong), the famous winged horse of Greek fable, said to have sprung from the trunk of the Gorgon Medusa when her head was cut off by Perseus. Bellerophon caught him as he drank of the spring Peirene on the Acrocorinthus at Corinth, or received him tamed and bridled at the hands of Athena (Pindar, *Ol.* xiii. 63; Pausanias ii. 4). Mounted on Pegasus, Bellerophon slew the Chimaera and overcame the Solymi and the Amazons, but when he tried to fly to heaven on the horse's back he threw him and continued his heavenward course (Apollodorus ii. 3). Arrived in heaven, Pegasus served Zeus, fetching for him his thunder and lightning (Hesiod, *Theog.* 281). Hence some have thought that Pegasus is a symbol of the thundercloud. According to O. Gruppe (*Griechische Mythologie*, i. 75, 123) Pegasus, like Arion the fabled offspring of Demeter and Poseidon, was a curse-horse, symbolical of the rapidity with which curses were fulfilled. In later legend he is the horse of Eos, the morning. The erroneous derivation from πηγή, "a spring of water," may have given birth to the legends which connect Pegasus with water; *e.g.* that his father was Poseidon, that he was born at the springs of Ocean, and that he had the power of making springs rise from the ground by a blow of his hoof. When Mt Helicon, enchanted by the song of the Muses, began to rise to heaven, Pegasus stopped its ascent by stamping on the ground (Antoninus Liberalis 9), and where he struck the earth Hippocrene (horse-spring), the fountain of the Muses, gushed forth (Pausanias ii. 31, ix. 31). But there are facts that speak for an independent mythological connexion between horses and water, *e.g.* the sacredness of the horse to Poseidon, the epithets Hippios and Equester applied to Poseidon and Neptune, the Greek fable of the origin of the first horse (produced by Poseidon striking the ground with his trident), and the custom in Argolis of sacrificing horses to Poseidon by drowning them in a well. From his connexion with Hippocrene Pegasus has come to be regarded as the horse of the Muses and hence as a symbol of poetry. But this is a modern attribute of Pegasus, not known to the ancients, and dating only from the *Orlando innamorato* of Boiardo.

See monograph by F. Hannig, *Breslauer philologische Abhandlungen* (1902), vol. viii., pt. 4.

PEGAU, a town of Germany, in the kingdom of Saxony, situated in a fertile country, on the Elster, 18 m. S.W. from Leipzig by the railway to Zeitz. Pop. (1905), 5656. It has two Evangelical churches, that of St Lawrence being a fine Gothic structure, a 16th-century town-hall; a very old hospital and an agricultural school. Its industries embrace the manufacture of felt, boots and metal wares.

Pegau grew up round a monastery founded in 1096, but does not appear as a town before the close of the 12th century. Markets were held here and its prosperity was further enhanced by its position on a main road running east and west. In the monastery, which was dissolved in 1539, a valuable chronicle was compiled, the *Annales pegavienses*, covering the period from 1039 to 1227.

See Füssel, *Anfang und Ende des Klosters St Jacob zu Pegau* (Leipzig, 1857); and Dillner, Grössel and Günther, *Altes und neues aus Pegau* (Leipzig, 1905). The *Annales pegavienses* are published in Bd. XVI. of the *Monumenta Germaniae historica: Scriptores.*

PEGMATITE (from Gr. πῆγμα, a bond), the name given by Haüy to those masses of graphic granite which frequently occur in veins. They consist of quartz and alkali feldspars in crystalline intergrowth (see PETROLOGY, Plate II. fig. 6). The term was subsequently used by Naumann to signify also the coarsely crystalline veins rich in quartz, feldspar and muscovite, which often in great numbers ramify through outcrops of granite and the surrounding rocks. This application of the name has now obtained general acceptance, and has been extended by many authors to include vein-rocks of similar structure and geological relationships, which occur with syenites, diorites and gabbros. Only a few of these pegmatites have graphic structure or mutual intergrowth of their constituents. Many of them are exceedingly coarse-grained; in granite-pegmatites the feldspars may be several feet or even yards in diameter, and other minerals such as apatite and tourmaline often occur in gigantic crystals. Pegmatites consist of minerals which are found also in the rocks from which they are derived, *e.g.* granite-pegmatites contain principally quartz and feldspar while gabbro-pegmatites consist of diallage and plagioclase. Rare minerals, however, often occur in these veins in exceptional amount and as very perfect crystals. The minerals of the pegmatites are always those which were last to separate out from the parent rock. As the basic minerals are the first formed the pegmatites contain a larger proportion of the acid or more siliceous components which were of later origin. In granite-pegmatites there is little hornblende, biotite or sphene, but white mica, feldspar and quartz make up the greater part of the veins. In gabbro-pegmatites olivine seldom occurs, but diallage and plagioclase occur in abundance. In this respect the pegmatites and aplites agree; both are of more acid types than the average rock from which they came, but the pegmatites are coarsely crystalline while the aplites are fine-grained. Segregations of the early minerals of a rock are frequent as nodules, lumps and streaks scattered through its mass, and often dikes of basic character (lamprophyres, &c.) are injected into the surrounding country. These have been grouped together as intrusions of *melanocrate* facies (μέλας, black, κράτος, strength, predominance) because in them the dark basic minerals preponderate. The aplites and pegmatites, on the other hand, are *leucocrate* (λευκός, white), since they are of acid character and contain relatively large amounts of the white minerals quartz and feldspar.

Pegmatites are associated with plutonic or intrusive rocks and were evidently formed by slow crystallization at considerable depths below the surface: nothing similar to them is known in lavas. They are very characteristic of granites, especially those which contain muscovite and much alkali feldspar; in gabbros, diorites and syenites pegmatite dikes are comparatively rare. The coarsely crystalline structure may be ascribed to slow crystallization; and is partly the result of the rocks, in which the veins lie, having been at a high temperature when the minerals of the pegmatites separated out. In accordance with this we find that pegmatite veins are nearly always restricted

to the area occupied by the parent rock (e.g. the granite), or to its immediate vicinity, and within the zone which has been greatly heated by the plutonic intrusion, viz. the contact aureole. Another very important factor in producing the coarse crystallization of the pegmatite veins is the presence of abundant water vapour and other gases which served as mineralizing agents and facilitated the building together of the rock molecules in large crystalline individuals.

Proof that these vapours were important agents in the formation of pegmatites is afforded by many of the minerals contained in the veins. Boron, fluorine, hydrogen, chlorine and other volatile substances are essential components of some of these minerals. Thus tourmaline, which contains boron and fluorine, may be common in the pegmatites but rare in the granite itself. Fluorine or chlorine are present in apatite, another frequent ingredient of granite pegmatites. Muscovite and gilbertite both contain hydrogen and fluorine; topaz is rich in fluorine also and all of these are abundant in some pegmatites. The stimulating effect which volatile substances exert on crystallizing molten masses is well known to experimental geologists who, by mixing tungstates and fluorides with fused powders, have been able to produce artificial minerals which they could not otherwise obtain. Most pegmatites are truly igneous rocks so far as their composition goes, but in their structure they show relations to the aqueous mineral veins. Many of them for example have a comby structure, that is to say, their minerals are columnar and stand perpendicular to the walls of the fissure occupied by the vein. Sometimes they have a banding owing to successive deposits having been laid down of different character; mica may be external, then feldspar, and in the centre a leader or string of pure quartz. In pegmatite veins also there are very frequently cavities or vugs, which are lined by crystals with very perfect faces. These bear much resemblance to the miarolitic or drusy cavities common in granite, and like them were probably filled with the residual liquid which was left over after the mineral substances were deposited in crystals.

Pegmatites are very irregular not only in distribution, width and persistence, but also in composition. The relative abundance of the constituent minerals may differ rapidly and much from point to point. Sometimes they are rich in mica, in enormous crystals for which the rock is mined or quarried (India). Other pegmatites are nearly pure feldspar, while others are locally (especially near their terminations) very full of quartz. They may in fact pass into quartz veins (alaskites) some of which are auriferous (N. America). Quartz veins of another type are very largely developed, especially in regions of slate and phyllite; they are produced by segregation of dissolved silica from the country rock and its concentration into cracks produced by stretching of the rock masses during folding. In these segregation veins, especially when the beds are of feldspathic nature, crystals of albite and orthoclase may appear, in large or small quantity. In this way a second type of pegmatite (segregation pegmatite) is formed which is very difficult to distinguish from true igneous veins. These two have, however, much in common as regards the conditions under which they were formed. Great pressures, presence of water, and a high though not necessarily very high temperature were the principal agencies at work.

Granite pegmatites are laid down after their parent mass had solidified and while it was cooling down: sometimes they contain such minerals as garnet, not found in the main mass, and showing that the temperature of crystallization was comparatively low. Another special feature of these veins is the presence of minerals containing precious metals or rare earths. Gold occurs in not a few cases; tin in others, while sulphides such as copper pyrites are found also. Beryl is the commonest of the minerals of the second group: spodumene is another example, and there is much reason to hold that diamond is a native of some of the pegmatites of Brazil and India, though this is not yet incontestably proved. The syenite-pegmatites of south Norway are remarkable both for their coarse crystallization and for the great number of rare minerals they have yielded. Among these may be mentioned laavenite, rinkite, rosenbuschite, mosandrite, pyrochlore, perofskite and lamprophyllite. (J. S. F.)

PEGNITZ, a river of Germany. It rises near Lindenhard in Upper Franconia (Bavaria) from two sources. At first it is called the Fichtenohe, but at Buchau it takes the name of the Pegnitz, and flowing in a south-westerly direction disappears below the small town of Pegnitz in a mountain cavern. It emerges through three orifices, enters Middle Franconia, and after flowing through the heart of the city of Nuremberg falls into the Regnitz at Fürth.

See Specht, *Das Pegnitzgebiet in Bezug auf seinen Wasserhaushalt* (Munich, 1905).

The *Pegnitz Order* (Order of the society of Pegnitz shepherds), also known as "the crowned flower order on the Pegnitz," was one of the societies founded in Germany in the course of the 17th century for the purification and improvement of the German language, especially in the domain of poetry. Georg Philipp Harsdörffer and Johann Klaj instituted the order in Nuremberg in 1644, and named it after the river. Its emblem was the passion flower with Pan's pipes, and the motto *Mit Nutzen erfreulich*, or *Alle zu einem Ton einstimmig*. The members set themselves the task of counteracting the pedantry of another school of poetry by imagination and gaiety, but lacking imagination and broad views they took refuge in allegorical subjects and puerile trifling. The result was to debase rather than to raise the standard of poetic art in Germany. At first the meetings of the order were held in private grounds, but in 1681 they were transferred to a forest near Kraftshof or Naunhof. In 1794 the order was reorganized, and it now exists merely as a literary society.

See Tittman, *Die nürnberger Dichterschule* (Göttingen, 1847); and the *Festschrift zur 250 jahrigen Jubelfeier des pegnesischen Blumenordens* (Nuremberg, 1894).

PEGOLOTTI, FRANCESCO BALDUCCI (*fl.* 1315–1340), Florentine merchant and writer, was a factor in the service of the mercantile house of the Bardi, and in this capacity we find him at Antwerp from 1315 (or earlier) to 1317; in London in 1317 and apparently for some time after; in Cyprus from 1324 to 1327, and again (or perhaps in unbroken continuation of his former residence) in 1335. In this last year he obtained from the king of Little Armenia (*i.e.* medieval Cilicia, &c.) a grant of privileges for Florentine trade. Between 1335 and 1343, probably in 1339–1340, he compiled his *Libro di divisamenti di paesi e di misuri di mercatanzie e d'altre cose bisognevoli di sapere a' mercatanti*, commonly known as the *Pratica della mercatura* (the name given it by Pagnini). Beginning with a sort of glossary of foreign terms then in use for all kinds of taxes or payments on merchandise as well as for "every kind of place where goods might be bought or sold in cities," the *Pratica* next describes some of the chief trade routes of the 14th century, and many of the principal markets then known to Italian merchants; the imports and exports of various important commercial regions; the business customs prevalent in each of those regions; and the comparative value of the leading moneys, weights and measures. The most distant and extensive trade routes described by Pegolotti are: (1) that from Tana or Azov to Peking via Astrakhan, Khiva, Otrar, Kulja and Kanchow (Gittarchan, Organci, Ottrarre, Armalecco and Camexu in the *Pratica*); (2) that from Lajazzo on the Cilician coast to Tabriz in north Persia via Sivas, Erzingan and Erzerum (Salvastro, Arzinga and Arzerone); (3) that from Trebizond to Tabriz. Among the markets enumerated are: Tana, Constantinople, Alexandria, Damietta, and the ports of Cyprus and the Crimea. Pegolotti's notices of ports on the north of the Black Sea are very valuable; his works show us that Florentine exports had now gained a high reputation in the Levant. In other chapters an account is given of 14th-century methods of packing goods (ch. 29); of assaying gold and silver (ch. 35); of shipment; of "London in England in itself" (ch. 62); of monasteries in Scotland and England ("Scotland of England," *Scozia di Inghilterra*) that were rich in wool (ch. 63). Among the latter are Newbattle, Balmerino, Cupar, Dunfermline, Dundrennan, Glenluce, Coldingham, Kelso, Newminster near Morpeth, Furness, Fountains, Kirkstall, Kirstead, Swineshead, Sawley

and Calder. Pegolotti's interest in England and Scotland is chiefly connected with the wool trade.

There is only one MS. of the *Pratica*, viz. No. 2441 in the Riccardian Library at Florence (241 fols., occupying the whole volume), written in 1471; and one edition of the text, in vol. iii. of Gian Francesco Pagnini's *Della Decima e delle altre gravezze imposte dal commune di Firenze* (Lisbon and Lucca—really Florence—1766); Sir Henry Yule, *Cathay*, ii. 279–308, translated into English the most interesting sections of Pegolotti, with valuable commentary (London, Hakluyt Society, 1866). See also W. Heyd, *Commerce du Levant*, ii., 12, 50, 58, 78–79, 85–86, 112–119 (Leipzig, 1886); H. Kiepert, in *Sitzungsberichte der philos.-hist. Cl. der berliner Akad.*, p. 901, &c. (Berlin, 1881); C. R. Beazley, *Dawn of Modern Geography*, iii. 324–332, 550, 555 (Oxford, 1906).

PEGU, a town and former capital of Lower Burma, giving its name to a district and a division. The town is situated on a river of the same name, 47 m. N.E. of Rangoon by rail; pop. (1901), 14,132. It is still surrounded by the old walls, about 40 ft. wide, on which have been built the residences of the British officials. The most conspicuous object is the Shwe-maw-daw pagoda, 324 ft. high, considerably larger and even more holy than the Shwe-dagon pagoda at Rangoon. Pegu is said to have been founded in 573, as the first capital of the Talaings; but it was as the capital of the Toungoo dynasty that it became known to Europeans in the 16th century. About the middle of the 18th century it was destroyed by Alompra; but it rose again, and was important enough to be the scene of fighting in both the first and second Burmese Wars. It gave its name to the province (including Rangoon) which was annexed by the British in 1852.

The district, which was formed in 1883, consists of an alluvial tract between the Pegu Yoma range and the Sittang river: area, 4276 sq. m.; pop. (1901), 339,572, showing an increase of 43 % in the decade. Christians numbered nearly 9000, mostly Karens. Almost the only crop grown is rice, which is exported in large quantities to Rangoon. The district is traversed by the railway, and also crossed by the Pegu-Sittang canal, navigable for 85 m., with locks.

The division of Pegu comprises the five districts of Rangoon city, Hanthawaddy, Tharrawaddy, Pegu and Prome, lying east of the Irrawaddy: area 13,084 sq. m.; pop. (1901), 1,820,638.

Pegu has also given its name to the Pegu Yoma, a range of hills running north and south for about 200 m., between the Irrawaddy and Sittang rivers. The height nowhere exceeds 2000 ft. but the slopes are steep and rugged. The forests yield teak and other valuable timber. The Pegu river, which rises in this range, falls into the Rangoon river just below Rangoon city, after a course of about 180 m.

PEILE, JOHN (1838–1910), English philologist, was born at Whitehaven on the 24th of April 1838. He was educated at Repton and Christ's College, Cambridge. After a distinguished career (Craven scholar, senior classic and chancellor's medallist), he became fellow and tutor of his college, reader of comparative philology in the university (1884–1891), and in 1887 was elected master of Christ's. He took a great interest in the higher education of women and became president of Newnham College. He was the first to introduce the great philological works of George Curtius and Wilhelm Corssen to the English student in his *Introduction to Greek and Latin Etymology* (1869). He died at Cambridge on the 9th of October 1910, leaving practically completed his exhaustive history of Christ's College.

PEINE, a town of Germany, in the Prussian province of Hanover, 16 m. by rail N.W. of Brunswick, on the railway to Hanover and Hamburg. Pop. (1905), 15,421. The town has a Roman Catholic and a Protestant church and several schools. Its industries include iron and steel works, breweries, distilleries and brickyards, and the manufacture of starch, sugar, malt, machinery and artificial manure. There are also large horse and cattle markets held here. Peine was at one time a strongly fortified place, and until 1803 belonged to the bishopric of Hildesheim.

PEINE FORTE ET DURE (French for "hard and severe punishment"), the term for a barbarous torture inflicted on those who, arraigned of felony, refused to plead and stood silent, or challenged more than twenty jurors, which was deemed a contumacy equivalent to a refusal to plead. By early English law a prisoner, before he could be tried, must plead "guilty" or "not guilty." Before the 13th century it was usual to imprison and starve till submission, but in Henry IV.'s reign the *peine* was employed. The prisoner was stretched on his back, and stone or iron weights were placed on him till be either submitted or was pressed to death. Pressing to death was abolished in 1772; "standing mute" on an arraignment of felony being then made equivalent to conviction. By an act of 1828 a plea of "not guilty" was to be entered against any prisoner refusing to plead, and that is the rule to-day. An alternative to the *peine* was the tying of the thumbs tightly together with whip-cord until pain forced the prisoner to speak. This was said to be a common practice at the Old Bailey up to the 19th century.

Among recorded instances of the infliction of the *peine* are Juliana Quick (1442) for high treason in speaking derisively of Henry VI.; Margaret Clitherow, "the martyr of York" (1586); Walter Calverly, of Calverly, Yorks, for the murder of his children (1605); and Major Strangways at Newgate, charged with murder of his brother-in-law (1657). In this last case it is said that upon the weights being placed in position several cavalier friends of Strangways sprang on his body and put him out of his pain. In 1721 one Nathaniel Hawes lay under a weight of 250 ℔ for seven minutes, finally submitting. The *peine* was last employed in 1741 at Cambridge assizes, when a prisoner was so put to death; the penalty of thumb-tying having first been tried. In 1692 at Salem, Massachusetts, Giles Corey, accused of witchcraft, refusing to plead, was pressed to death. This is believed to be the only instance of the infliction of the penalty in America.

PEIPUS, or CHUDSKOYE OZERO, a lake of north-west Russia, between the governments of St Petersburg, Pskov, Livonia and Esthonia. Including its southern extension, sometimes known as Lake Pskov, it has an area of 1356 sq. m. Its shores are flat and sandy, and in part wooded; its waters deep, and they afford valuable fishing. The lake is fed by the Velikaya, which enters it at its southern extremity, and by the Embach, which flows in half way up its western shore; it drains into the Gulf of Finland by the Narova, which issues at its north-east corner.

PEIRAEUS, or PIRAEUS (Gr. Πειραιεύς), the port town of Athens, with which its history is inseparably connected. Pop. (1907), 67,982. It consists of a rocky promontory, containing three natural harbours, a large one on the north-west which is still one of the chief commercial harbours of the Levant, and two smaller ones on the east, which were used chiefly for naval purposes. Themistocles was the first to urge the Athenians to take advantage of these harbours, instead of using the sandy bay of Phaleron; and the fortification of the Peiraeus was begun in 493 B.C. Later on it was connected with Athens by the Long Walls in 460 B.C. The town of Peiraeus was laid out by the architect Hippodamus of Miletus, probably in the time of Pericles. The promontory itself consisted of two parts—the hill of Munychia, and the projection of Acte; on the opposite side of the great harbour was the outwork of Eetioneia. The most stirring episode in the history of the Peiraeus is the seizure of Munychia by Thrasybulus and the exiles from Phyle, and the consequent destruction of the "30 tyrants" in 404 B.C. The three chief arsenals of the Peiraeus were named Munychia, Zea and Cantharus, and they contained galley slips for 82, 196 and 94 ships respectively in the 4th century B.C.

PEIRCE, BENJAMIN (1809–1880), American mathematician and astronomer, was born at Salem, Massachusetts, on the 4th of April 1809. Graduating at Harvard College in 1829, he became mathematical tutor there in 1831 and professor in 1833. He had already assisted Nathaniel Bowditch in his translation of the *Mécanique céleste*, and now produced a series of mathematical textbooks characterized by the brevity and terseness which made his teaching unattractive to inapt pupils. Young men of talent, on the contrary, found his instruction most stimulating, and after Bowditch's death in 1838 Peirce stood first among American mathematicians. His researches into the perturbations of Uranus and Neptune (*Proc. Amer.*

Acad., 1848) gave him a wider fame; he became in 1849 consulting astronomer to the *American Nautical Almanac*, and for this work prepared new tables of the moon (1852). A discussion of the equilibrium of Saturn's rings led him to conclude in 1855 that they must be of a fluid nature. From 1867 to 1874 he was superintendent of the Coast Survey. In 1857 he published his best known work, the *System of Analytical Mechanics*, which was, however, surpassed in brilliant originality by his *Linear Associative Algebra* (lithographed privately in a few copies, 1870; reprinted in the *Amer. Journ. Math.*, 1882). He died at Cambridge, Mass., on the 6th of October 1880.

PEISANDER, of Camirus in Rhodes, Greek epic poet, supposed to have flourished about 640 B.C. He was the author of a *Heracleia*, in which he introduced a new conception of the hero, the lion's skin and club taking the place of the older Homeric equipment. He is also said to have fixed the number of the "labours of Hercules" at twelve. The work, which according to Clement of Alexandria (*Stromata*, vi. ch. 2) was simply a plagiarism from an unknown Pisinus of Lindus, enjoyed so high a reputation that the Alexandrian critics admitted the author to the epic canon. From an epigram (20) of Theocritus we learn that a statue was erected in honour of Peisander by his countrymen. He is to be distinguished from Peisander of Laranda in Lycia, who lived during the reign of Alexander Severus (A.D. 222–235), and wrote a poem on the mixed marriages of gods and mortals, after the manner of the *Eoiai* of Hesiod.

See fragments in G. Kinkel, *Epicorum graecorum fragmenta* (1878); also F. G. Welcker, *Kleine Schriften*, vol. i. (1844), on the twelve labours of Hercules in Peisander.

PEISISTRATUS (605?–527 B.C.), Athenian statesman, was the son of Hippocrates. He was named after Peisistratus, the youngest son of Nestor, the alleged ancestor of his family; he was second cousin on his mother's side to Solon, and numbered among his ancestors Codrus the last great king of Athens. Thus among those who became "tyrants" in the Greek world he gained his position as one of the old nobility, like Phalaris of Agrigentum, and Lygdamis of Naxos; but unlike Orthagoras of Sicyon, who had previously been a cook. Peisistratus, though Solon's junior by thirty years, was his lifelong friend (though this is denied), nor did their friendship suffer owing to their political antagonism. From this widely accepted belief arose the almost certainly false statement that Peisistratus took part in Solon's successful war against Megara, which necessarily took place before Solon's archonship (probably in 600 B.C.). Aristotle's *Constitution of Athens* (ch. 17) carefully distinguishes Solon's Megarian War from a second in which Peisistratus was no doubt in command, undertaken between 570 and 565 to recapture Nisaea (the port of Megara) which had apparently been recovered by the Megarians since Solon's victory (see Sandys on *The Constitution of Athens*, ch. 14, 1, note, and E. Abbott, *History of Greece*, vol. i. app. p. 544). Whatever be the true explanation of this problem, it is certain (1) that Peisistratus was regarded as a leading soldier, and (2) that his position was strengthened by the prestige of his family. Furthermore (3) he was a man of great ambition, persuasive eloquence and wide generosity; qualities which especially appealed at that time to the classes from whom he was to draw his support—hence the warning of Solon (Frag. II. B): "Fools, you are treading in the footsteps of the fox; can you not read the hidden meaning of these charming words?" Lastly, (4) and most important, the times were ripe for revolution. In the article on SOLON (*ad fin.*) it is shown that the Solonian reforms, though they made a great advance in some directions, failed on the whole. They were too moderate to please the people, too democratic for the nobles. It was found that the government by Boulē and Ecclesia did not mean popular control in the full sense; it meant government by the leisured classes, inasmuch as the industrious farmer or herdsman could not leave his work to give his vote at the Ecclesia, or do his duty as a councillor. Partly owing to this, and partly to ancient feuds whose origin we cannot trace, the Athenian people was split up into three great factions known as the Plain (*Pedieis*) led by Lycurgus and Miltiades, both of noble families; the Shore (*Parali*) led by the Alcmaeonidae, represented at this time by Megacles, who was strong in his wealth and by his recent marriage with Agariste, daughter of Cleisthenes of Sicyon; the Hill or Upland (*Diacreis*, *Diacrii*) led by Peisistratus, who no doubt owed his influence among these hillmen partly to the possession of large estates at Marathon. In the two former divisions the influence of wealth and birth predominated; the hillmen were poorly housed, poorly clad and unable to make use of the privileges which Solon had given them.[1] Hence their attachment to Peisistratus, the "man of the people," who called upon them to sweep away the last barriers which separated rich and poor, nobles and commoners, city and countryside. Lastly, there was a class of men who were discontented with the Solonian constitution: some had lost by his Seisachtheia, others had vainly hoped for a general redistribution. These men saw their only hope in a revolution. Such were the factors which enabled him to found his tyranny.

To enter here into an exhaustive account of the various theories which even before, though especially after, the appearance of the *Constitution of Athens* have been propounded as to the chronology of the Peisistratean tyranny, is impossible. For a summary of these hypotheses see J. E. Sandys's edition of the *Constitution of Athens* (p. 56, c. 14 note). The following is in brief the sequence of events: In 560 B.C. Peisistratus drove into the market-place, showed to an indignant assembly marks of violence on himself and his mules, and claimed to be the victim of assault at the hands of political enemies. The people unhesitatingly awarded their "champion" a bodyguard of fifty men (afterwards four hundred) armed with clubs. With this force he proceeded to make himself master of the Acropolis and tyrant of Athens. The Alcmaeonids fled and Peisistratus remained in power for about five years, during which Solon's death occurred. In 555 or 554 B.C. a coalition of the Plain and the Coast succeeded in expelling him. His property was confiscated and sold by auction, but in his absence the strife between the Plain and the Coast was renewed, and Megacles, unable to hold his own, invited him to return. The condition was that their families should be allied by the marriage of Peisistratus to Megacles' daughter Coesyra. A second *coup d'état* was then effected. A beautiful woman, it is said, by name Phya, was disguised as Athena and drove into the Agora with Peisistratus at her side, while proclamations were made that the goddess herself was restoring Peisistratus to Athens. The ruse was successful, but Peisistratus soon quarrelled with Megacles over Coesyra. By a former marriage he already had two sons, Hippias and Hipparchus, now growing up, and in his first tyranny or his first exile he married an Argive, Timonassa, by whom he had two other sons Iophon and Hegesistratus, the latter of whom is said to be identical with Thessalus (*Ath. Pol.* c. 17), though from Thucydides and Herodotus we gather that they were distinct—*e.g.* Herodotus describes Hegesistratus as a bastard, and Thucydides says that Thessalus was legitimate. Further it is suggested that Peisistratus was unwilling to have children by one on whom lay the curse of the Cylonian outrage. The result was that in the seventh year (or month, see *Ath. Pol.* c. 15. 1, Sandys's note) Megacles accused him of neglecting his daughter, combined once more with the third faction, and drove the tyrant into an exile lasting apparently for ten or eleven years. During this period he lived first at Rhaecelus and later near Mt Pangaeus and on the Strymon collecting resources of men and money. He came finally to Eretria, and, with the help of the Thebans and Lygdamis of Naxos, whom he afterwards made ruler of that island, he passed over to Attica and defeated the Athenian forces at the battle of Pallenis or Pellene. From this time till his death he remained undisputed master of Athens. The Alcmaeonids were compelled to leave Athens, and from

[1] It is suggested with probability that the Diacrii were rather the miners of the Laurium district (P. M. Ure, *Journ. Hell. Stud.*, 1906, pp. 131–142).

and Calder. Pegolotti's interest in England and Scotland is chiefly connected with the wool trade.

There is only one MS. of the *Pratica*, viz. No. 2441 in the Riccardian Library at Florence (241 fols., occupying the whole volume), written in 1471; and one edition of the text, in vol. iii. of Gian Francesco Pagnini's *Della Decima e delle altre gravezze imposte dal commune di Firenze* (Lisbon and Lucca—really Florence—1766); Sir Henry Yule, *Cathay*, ii. 279–308, translated into English the most interesting sections of Pegolotti, with valuable commentary (London, Hakluyt Society, 1866). See also W. Heyd, *Commerce du Levant*, ii., 12, 50, 58, 78–79, 85–86, 112–119 (Leipzig, 1886); H. Kiepert, in *Sitzungsberichte der philos.-hist. Cl. der berliner Akad.*, p. 901, &c. (Berlin, 1881); C. R. Beazley, *Dawn of Modern Geography*, iii. 324–332, 550, 555 (Oxford, 1906).

PEGU, a town and former capital of Lower Burma, giving its name to a district and a division. The town is situated on a river of the same name, 47 m. N.E. of Rangoon by rail; pop. (1901), 14,132. It is still surrounded by the old walls, about 40 ft. wide, on which have been built the residences of the British officials. The most conspicuous object is the Shwe-maw-daw pagoda, 324 ft. high, considerably larger and even more holy than the Shwe-dagon pagoda at Rangoon. Pegu is said to have been founded in 573, as the first capital of the Talaings; but it was as the capital of the Toungoo dynasty that it became known to Europeans in the 16th century. About the middle of the 18th century it was destroyed by Alompra; but it rose again, and was important enough to be the scene of fighting in both the first and second Burmese Wars. It gave its name to the province (including Rangoon) which was annexed by the British in 1852.

The district, which was formed in 1883, consists of an alluvial tract between the Pegu Yoma range and the Sittang river: area, 4276 sq. m.; pop. (1901), 339,572, showing an increase of 43 % in the decade. Christians numbered nearly 9000, mostly Karens. Almost the only crop grown is rice, which is exported in large quantities to Rangoon. The district is traversed by the railway, and also crossed by the Pegu-Sittang canal, navigable for 85 m., with locks.

The division of Pegu comprises the five districts of Rangoon city, Hanthawaddy, Tharrawaddy, Pegu and Prome, lying east of the Irrawaddy: area 13,084 sq. m.; pop. (1901), 1,820,638.

Pegu has also given its name to the Pegu Yoma, a range of hills running north and south for about 200 m., between the Irrawaddy and Sittang rivers. The height nowhere exceeds 2000 ft. but the slopes are steep and rugged. The forests yield teak and other valuable timber. The Pegu river, which rises in this range, falls into the Rangoon river just below Rangoon city, after a course of about 180 m.

His researches into the perturbations of Uranus and Neptune (*Proc. Amer.*

Pekin Union and (for freight between Peoria and Pekin) the Illinois Valley Belt railways. Situated in a rich agricultural region and in the Illinois coalfields, Pekin is a shipping point and grain market of considerable importance, and has various manufactures. The value of the factory products in 1905 was $1,121,130. Pekin was first settled about 1830, was incorporated in 1839, and re-incorporated in 1874.

PEKING, or PEKIN, the capital of the Chinese Empire situated in 39° 57' N. and 116° 29' E., on the northern extremity of the great alluvial delta which extends southward from its walls for 700 m. For nine centuries Peking, under various names and under the dominion of successive dynasties, has, with some short intervals, remained an imperial city. Its situation near the northern frontier recommended it to the Tatar invaders as a convenient centre for their power, and its peculiarly fortunate position as regards the supernatural terrestrial influences pertaining to it has inclined succeeding Chinese monarchs to accept it as the seat of their courts. In 986 it was taken by an invading force of Khitan Tatars, who adopted it as their headquarters and named it Nanking, or the "southern capital." During the early part of the 12th century the Chinese recaptured it and reduced it from the rank of a metropolis to that of a provincial city of the first grade, and called it Yen-shan Fu. In 1151 it fell into the hands of the Kin Tatars, who made it a royal residence under the name of Chung-tu, or "central capital." Less than a century later it became the prize of Jenghiz Khan, who, having his main interests centred on the Mongolian steppes, declined to move his court southwards. His great successor Kublai Khan (1280–1294), rebuilt the town, which he called Yenking, and which became known in Chinese as Ta-tu, or "great court," and in Mongolian as Khanbalik (Cambaluc), or "city of the khan." During the reign of the first emperor of the dynasty (1368–1399) which succeeded that founded by Jenghiz Khan the court resided at the modern Nanking, but the succeeding sovereign Yung-lo (1403–1425) transferred his court to Pe-king (*i.e.* "north-court"), which has ever since been the seat of government. For further history see CAMBALUC.

During the periods above mentioned the extent and boundaries of the city varied considerably. Under the Kin dynasty the walls extended to the south-west of the Tatar portion of the present city, and the foundations of the northern ramparts of the Khan-balik of Kublai Khan are still to be traced at a distance of about 2 m. north beyond the existing walls. The modern city consists of the *nei ch'êng*, or inner city, commonly known to foreigners as the "Tatar city," and the *wai ch'êng*, or outer city, known in the same way as the "Chinese city." These names are somewhat misleading, as the inner city is not enclosed within the outer city, but adjoins its northern wall, which, being longer than the *nei ch'êng* is wide, outflanks it considerably at both ends. The outer walls of the double city contain an area of about 25 sq. m., and measure 30 m. in circumference. Unlike the walls of most Chinese cities, those of Peking are kept in perfect order. Those of the Tatar portion, which is the oldest part of the city, are 50 ft. high, with a width of 60 ft. at the base and 40 ft. at the top, while those of the Chinese city, which were built by the emperor Kia-tsing in 1543, measure 30 ft. in height, and have a width of 25 ft. at the base and 15 ft. at the top. The terre-plein is well and smoothly paved, and is defended by a crenellated parapet. The outer faces of the walls are strengthened by square buttresses built out at intervals of 60 yds., and on the summits of these stand the guard-houses for the troops on duty. Each of the sixteen gates of the city is protected by a semicircular enceinte, and is surmounted by a high tower built in galleries and provided with countless loopholes.

Peking suffered severely during the Boxer movement and the siege of the legations in the summer of 1900. Not only were most of the foreign buildings destroyed, but also a large number of important Chinese buildings in the vicinity of the foreign quarter, including the ancient Hanlin Yuen, the boards of war, rites, &c. Almost the whole of the business quarter, the wealthiest part of the Chinese city, was laid in ashes (see CHINA: *History*).

The population of Peking is reckoned to be about 1,000,000, a number which is out of all proportion to the immense area enclosed within its walls. This disparity is partly accounted for by the facts that large spaces, notably in the Chinese city, are not built over, and that the grounds surrounding the imperial palace, private residences and temples are very extensive. One of such enclosures constitutes the British legation, and most of the other foreign legations are similarly, though not so sumptuously, lodged. Viewed from the walls Peking looks like a city of gardens. Few crowded neighbourhoods are visible, and the characteristic features of the scene which meets the eye are the upturned roofs of temples, palaces, and mansions, gay with blue, green and yellow glazed tiles, glittering among the groves of trees with which the city abounds. It is fortunate that the city is not close-built or crowded, for since the first advent of foreigners in Peking in 1860 nothing whatever had been done until 1900 to improve the streets or the drainage. The streets as originally laid out were wide and spacious, but being unpaved and undrained they were no better than mud tracks diversified by piles of garbage and foul-smelling stagnant pools. Such drainage as had at one time existed was allowed to get choked up, giving rise to typhoid fever of a virulent type. Some attempt has been made to improve matters by macadamizing one of the principal thoroughfares, but it will be the labour of a Hercules to cleanse this vast city from the accumulated filth of ages of neglect.

Enclosed within the Tatar city is the *Hwang ch'êng*, or "Imperial city," which in its turn encloses the *Tsze-kin ch'êng*, or "Forbidden city," in which stands the emperor's palace. On the north of the *Tsze-kin ch'êng*, and separated from it by a moat, is an artificial mound known as the *King shan*, or "Prospect Hill." This mound, which forms a prominent object in the view over the city, is about 150 ft. high, and is topped with five summits, on each of which stands a temple. It is encircled by a wall measuring upwards of a mile in circumference, and is prettily planted with trees, on one of which the last emperor of the Ming dynasty (1644), finding escape from the Manchu invaders impossible, hanged himself. On the west of Prospect Hill is the *Si yuan*, or "Western Park," which forms part of the palace grounds. This park is tastefully laid out, and is traversed by a lake, which is mainly noticeable from the remarkably handsome marble bridge which crosses it from east to west. Directly northwards from Prospect Hill stands the residence of the Titu, or "governor of the city," and the Bell and the Drum Towers, both of which have attained celebrity from the nature of their contents—the first from the huge bell which hangs in it, and the second from the appliances it contains for marking the time. The bell is one of five which the emperor Yung-lo ordered to be cast. In common with the others, it weighs 120,000 lb, is 14 ft. high, 34 ft. in circumference at the rim, and 9 in. thick. It is struck by a wooden beam swung on the outside, and only at the changes of the night-watches, when its deep tone may be heard in all parts of the city. In the Drum Tower incense-sticks, specially prepared by the astronomical board, are kept burning to mark the passage of time, in which important duty their accuracy is checked by a clepsydra. Another of Yung-lo's bells is hung in a Buddhist temple outside the north-west angle of the city wall, and is covered both on the inside and outside with the Chinese texts of the *Lankâvatâra Sûtra*, and the *Saddharma pundarika Sûtra*.

Turning southwards we come again to the Forbidden City, the central portion of which forms the imperial palace, where, in halls which for the magnificence of their proportions and barbaric splendour are probably not to be surpassed anywhere, the Son of Heaven holds his court. In the eastern and western portions of this city are situated the residences of the highest dignitaries of the empire; while beyond its confines on the south stand the offices of the six official boards which direct the affairs of the eighteen provinces. It was in the "yamên" of one of these boards—the *Li Pu* or board of rites—that Lord Elgin signed the treaty at the conclusion of the war in 1860—an event which derives especial interest from the fact of its having been the first

and Calder. Pegolotti's interest in England and Scotland is chiefly connected with the wool trade.

There is only one MS. of the *Pratica*, viz. No. 2441 in the Riccardian Library at Florence (241 fols., occupying the whole volume), written in 1471; and one edition of the text, in vol. iii. of Gian Francesco Pagnini's *Della Decima e delle altre gravezze imposte dal commune di Firenze* (Lisbon and Lucca—really Florence—1766); Sir Henry Yule, *Cathay*, ii. 279-308, translated into English the most interesting sections of Pegolotti, with valuable commentary (London, Hakluyt Society, 1866). See also W. Heyd, *Commerce du Levant*, ii., 12, 50, 58, 78-79, 85-86, 112-119 (Leipzig, 1886); H. Kiepert, in *Sitzungsberichte der philos.-hist. Cl. der berliner Akad.*, p. 901, &c. (Berlin, 1881); C. R. Beazley, *Dawn of Modern Geography*, iii. 324-332, 550, 555 (Oxford, 1906).

PEGU, a town and former capital of Lower Burma, giving its name to a district and a division. The town is situated on a river of the same name, 47 m. N.E. of Rangoon by rail; pop. (1901), 14,132. It is still surrounded by the old walls, about 40 ft. wide, on which have been built the residences of the British officials. The most conspicuous object is the Shwe-maw-daw pagoda, 324 ft. high, considerably larger and even more holy than the Shwe-dagon pagoda at Rangoon. Pegu is said to have been founded in 573, as the first capital of the Talaings; but it was as the capital of the Toungoo dynasty that it became known to Europeans in the 16th century. About the middle of the 18th century it was destroyed by Alompra; but it rose again, and was important enough to be the scene of fighting in both the first and second Burmese Wars. It gave its name to the province (including Rangoon) which was annexed by the British in 1852.

The district, which was formed in 1883, consists of an alluvial tract between the Pegu Yoma range and the Sittang river: area, 4276 sq. m.; pop. (1901), 339,572, showing an increase of 43 % in the decade. Christians numbered nearly 9000, mostly Karens. Almost the only crop grown is rice, which is exported in large quantities to Rangoon. The district is traversed by the railway, and also crossed by the Pegu-Sittang canal, navigable for 85 m., with locks.

The division of Pegu comprises the five districts of Rangoon city, Hanthawaddy, Tharrawaddy, Pegu and Prome, lying east of the Irrawaddy: area 13,084 sq. m.; pop. (1901), 1,820,638.

Pegu has also given its name to the Pegu Yoma, a range of hills running north and south for about 200 m., between the Irrawaddy and Sittang rivers. The height nowhere exceeds 2000 ft. but the slopes are steep and rugged. The forests yield teak and other valuable timber. The Pegu river, which rises in this range, falls into the Rangoon river just below Rangoon city, after a course of about 180 m.

PEILE, JOHN (1838-1910), English philologist, was born at Whitehaven on the 24th of April 1838. He was educated at Repton and Christ's College, Cambridge. After a distinguished career (Craven scholar, senior classic and chancellor's medallist), he became fellow and tutor of his college, reader of comparative philology in the university (1884-1891), and in 1887 was elected master of Christ's. He took a great interest in the higher education of women and became president of Newnham College. He was the first to introduce the great philological works of George Curtius and Wilhelm Corssen to the English student in his *Introduction to Greek and Latin Etymology* (1869). He died at Cambridge on the 9th of October 1910, leaving practically completed his exhaustive history of Christ's College.

PEINE, a town of Germany, in the Prussian province of Hanover, 16 m. by rail N.W. of Brunswick, on the railway to Hanover and Hamburg. Pop. (1905), 15,421. The town has a Roman Catholic and a Protestant church and several schools. Its industries include iron and steel works, breweries, distilleries and brickyards, and the manufacture of starch, sugar, malt, machinery and artificial manure. There are also large horse and cattle markets held here. Peine was at one time a strongly fortified place, and until 1803 belonged to the bishopric of Hildesheim.

PEINE FORTE ET DURE (French for "hard and severe punishment"), the term for a barbarous torture inflicted on those who, arraigned of felony, refused to plead and stood silent, or challenged more than twenty jurors, which was deemed a contumacy equivalent to a refusal to plead. By early English law a prisoner, before he could be tried, must plead "guilty" or "not guilty." Before the 13th century it was usual to imprison and starve till submission, but in Henry IV.'s reign the *peine* was employed. The prisoner was stretched on his back, and stone or iron weights were placed on him till be either submitted or was pressed to death. Pressing to death was abolished in 1772; "standing mute" on an arraignment of felony being then made equivalent to conviction. By an act of 1828 a plea of "not guilty" was to be entered against any prisoner refusing to plead, and that is the rule to-day. An alternative to the *peine* was the tying of the thumbs tightly together with whipcord until pain forced the prisoner to speak. This was said to be a common practice at the Old Bailey up to the 19th century.

Among recorded instances of the infliction of the *peine* are Juliana Quick (1442) for high treason in speaking derisively of Henry VI.; Margaret Clitherow, "the martyr of York" (1586); Walter Calverly, of Calverly, Yorks, for the murder of his children (1605); and Major Strangways at Newgate, charged with murder of his brother-in-law (1657). In this last case it is said that upon the weights being placed in position several cavalier friends of Strangways sprang on his body and put him out of his pain. In 1721 one Nathaniel Hawes lay under a weight of 250 lb for seven minutes, finally submitting. The *peine* was last employed in 1741 at Cambridge assizes, when a prisoner was so put to death; the penalty of thumb-tying having first been tried. In 1692 at Salem, Massachusetts, Giles Corey, accused of witchcraft, refusing to plead, was pressed to death. This is believed to be the only instance of the infliction of the penalty in America.

PEIPUS, or CHUDSKOYE OZERO, a lake of north-west Russia, between the governments of St Petersburg, Pskov, Livonia and Esthonia. Including its southern extension, sometimes known as Lake Pskov, it has an area of 1356 sq. m. Its shores are flat and sandy, and in part wooded; its waters deep, and they afford valuable fishing. The lake is fed by the Velikaya, which enters it at its southern extremity, and by the Embach, which flows in half way up its western shore; it drains into the Gulf of Finland by the Narova, which issues at its north-east corner.

PEIRAEUS, or PIRAEUS (Gr. Πειραιεύς), the port town of Athens, with which its history is inseparably connected. Pop. (1907), 67,982. It consists of a rocky promontory, containing three natural harbours, a large one on the north-west which is still one of the chief commercial harbours of the Levant, and two smaller ones on the east, which were used chiefly for naval purposes. Themistocles was the first to urge the Athenians to take advantage of these harbours, instead of using the sandy bay of Phaleron; and the fortification of the Peiraeus was begun in 493 B.C. Later on it was connected with Athens by the Long Walls in 460 B.C. The town of Peiraeus was laid out by the architect Hippodamus of Miletus, probably in the time of Pericles. The promontory itself consisted of two parts—the hill of Munychia, and the projection of Acte; on the opposite side of the great harbour was the outwork of Eetioneia. The most stirring episode in the history of the Peiraeus is the seizure of Munychia by Thrasybulus and the exiles from Phyle, and the consequent destruction of the "30 tyrants" in 404 B.C. The three chief arsenals of the Peiraeus were named Munychia, Zea and Cantharus, and they contained galley slips for 82, 196 and 94 ships respectively in the 4th century B.C.

PEIRCE, BENJAMIN (1809-1880), American mathematician and astronomer, was born at Salem, Massachusetts, on the 4th of April 1809. Graduating at Harvard College in 1829, he became mathematical tutor there in 1831 and professor in 1833. He had already assisted Nathaniel Bowditch in his translation of the *Mécanique céleste*, and now produced a series of mathematical textbooks characterized by the brevity and terseness which made his teaching unattractive to inapt pupils. Young men of talent, on the contrary, found his instruction most stimulating, and after Bowditch's death in 1838 Peirce stood first among American mathematicians. His researches into the perturbations of Uranus and Neptune (*Proc. Amer.*

November. To make his apologies for this irregularity he sent Deacon Gregory, who afterwards became Pope Gregory the Great, as his apocrisiarius to Constantinople. In 585 he sought to heal the schism which had subsisted since the time of Pelagius I. in connexion with the Three Chapters, but his efforts were without success. In 588 John, patriarch of Constantinople, by reviving the old and disputed claim to the title of oecumenic patriarch, elicited a vigorous protest from Pelagius; but the decretal which professes to convey the exact words of the document is now known to be false. He died in January 590, and was succeeded by Gregory I.

PELAGIUS (*c.* 360– *c.* 420), early British theologian. Of the origin of Pelagius almost nothing is known. The name is supposed to be a graeeized form of the Cymric *Morgan* (sea-begotten). His contemporaries understood that he was of British (probably of Irish) birth, and gave him the appellation *Brito.* He was a large ponderous person, heavy both in body and mind (Jerome, " stolidissimus et Scotorum pultibus praegravatus "). He was influenced by the monastic enthusiasm which had been kindled in Gaul by Athanasius (336), and which, through the energy of Martin of Tours (361), rapidly communicated itself to the Britons and Scots. For, though Pelagius remained a layman throughout his life, and though he never appears in any strict connexion with a coenobite fraternity, he yet adhered to monastic discipline (" veluti monachus "), and distinguished himself by his purity of life and exceptional sanctity (" egregie Christianus "). He seems to have been one of the earliest, if not the very earliest, of that remarkable series of men who issued from the monasteries of Scotland and Ireland, and carried back to the Continent in a purified form the religion they had received from it. Coming to Rome in the beginning of the 5th century (his earliest known writing is of date 405), he found a scandalously low tone of morality prevalent. But his remonstrances were met by the plea of human weakness. To remove this plea by exhibiting the actual powers of human nature became his first object. It seemed to him that the Augustinian doctrine of total depravity and of the consequent bondage of the will both cut the sinew of all human effort and threw upon God the blame which really belonged to man. His favourite maxim was, " If I ought, I can."

The views of Pelagius did not originate in a conscious reaction against the influence of the Augustinian theology, although each of these systems was developed into its ultimate form by the opposition of the other. Neither must too much weight be allowed to the circumstance that Pelagius was a monk, for he was unquestionably alive to the delusive character of much that passed for monkish sanctity. Yet possibly his monastic training may have led him to look more at conduct than at character, and to believe that holiness could be arrived at by rigour of discipline. This view of things suited his matter-of-fact temperament. Judging from the general style of his writings, his religious development had been equable and peaceful, not marked by the prolonged mental conflict, or the abrupt transitions, which characterized the experience of his great opponent. With no great penetration he saw very clearly the thing before him, and many of his practical counsels are marked by sagacity, and are expressed with the succinctness of a proverb (" corpus non frangendum, sed regendum est "). His interests were primarily ethical; hence his insistence on the freedom of the will and his limitation of the action of divine grace.

The peculiar tenets of Pelagius, though indicated in the commentaries which he published at Rome previous to 409, might not so speedily have attracted attention had they not been adopted by Coelestius, a much younger and bolder man than his teacher. Coelestius, probably an Italian, had been trained as a lawyer, but abandoned his profession for an ascetic life. When Rome was sacked by the Goths (410) the two friends crossed to Africa. There Pelagius once or twice met with Augustine, but very shortly sailed for Palestine, where he justly expected that his opinions would be more cordially received. Coelestius remained in Carthage with the view of receiving ordination. But Aurelius, bishop of Carthage, being warned against him, summoned a synod, at which Paulinus, a deacon of Milan, charged Coelestius with holding the following six errors: (1) that Adam would have died even if he had not sinned; (2) that the sin of Adam injured himself alone, not the human race; (3) that new-born children are in the same condition in which Adam was before the fall; (4) that the whole human race does not die because of Adam's death or sin, nor will the race rise again because of the resurrection of Christ; (5) that the law gives entrance to heaven as well as the gospel; (6) that even before the coming of Christ there were men who were entirely without sin. To these propositions a seventh is sometimes added, " that infants, though unbaptized, have eternal life," a corollary from the third. Coelestius did not deny that he held these opinions, but he maintained that they were open questions, on which the Church had never pronounced. The synod, notwithstanding, condemned and excommunicated him. Coelestius, after a futile appeal to Rome, went to Ephesus, and there received ordination.

In Palestine Pelagius lived unmolested and revered, until in 415 Orosius, a Spanish priest, came from Augustine, who in the meantime had written his *De peccatorum meritis*, to warn Jerome against him. The result was that in June of that year Pelagius was cited by Jerome before John, bishop of Jerusalem, and charged with holding that man may be without sin, if only he desires it. This prosecution broke down, and in December of the same year Pelagius was summoned before a synod of fourteen bishops at Diospolis (Lydda). The prosecutors on this occasion were two deposed Gallican bishops, Heros of Arles and Lazarus of Aix, but on account of the illness of one of them neither could appear. The proceedings, being conducted in various languages and by means of interpreters, lacked certainty, and justified Jerome's application to the synod of the epithet " miserable." But there is no doubt that Pelagius repudiated the assertion of Coelestius, that " the divine grace and help is not granted to individual acts, but consists in free will, and in the giving of the law and instruction." At the same time he affirmed that a man is able, if he likes, to live without sin and keep the commandments of God, inasmuch as God gives him this ability. The synod was satisfied with these statements, and pronounced Pelagius to be in agreement with Catholic teaching. Pelagius naturally plumed himself on his acquittal, and provoked Augustine to give a detailed account of the synod, in which he shows that the language used by Pelagius was ambiguous, but that, being interpreted by his previous written statements, it involved a denial of what the Church understood by *grace* and by man's dependence on it. The North African Church as a whole resented the decisions of Diospolis, and in 416 sent up from their synods of Carthage and Mileve (in Numidia) an appeal to Innocent, bishop of Rome, who, flattered by the tribute thus paid to the see of Rome, decided the question in favour of the African synods. And, though his successor Zosimus wavered for some time, he at length fell in with what he saw to be the general mind of both the ecclesiastical and the civil powers. For, simultaneously with the largely attended African synod which finally condemned Pelagianism in the West, an imperial edict was issued at Ravenna by Honorius on the 30th of April 418, peremptorily determining the theological question and enacting that not only Pelagius and Coelestius but all who accepted their opinions should suffer confiscation of goods and irrevocable banishment. Thus prompted, Zosimus drew up a circular inviting all the bishops of Christendom to subscribe a condemnation of Pelagian opinions. Nineteen Italian bishops refused, among them Julian of Eclanum in Apulia, a man of good birth, approved sanctity and great capacity, who now became the recognized leader of the movement. But not even his acuteness and zeal could redeem a cause which was rendered hopeless when the Eastern Church (Ephesus, 431) confirmed the decision of the West. Pelagius himself disappears after 420; Coelestius was at Constantinople seeking the aid of Nestorius in 428.

Pelagianism.—The system of Pelagius is a consistent whole, each part involving the existence of every other. Starting from the idea that " ability limits obligation," and resolved that men

should feel their responsibility, he insisted that man is able to do all that God commands, and that there is, and can be, no sin where the will is not absolutely free—able to choose good or evil. The favourite Pelagian formula, "Si necessitatis est, peccatum non est; si voluntatis, vitari potest," had an appearance of finality which imposed on superficial minds. The theory of the will involved in this fundamental axiom of Pelagianism is that which is commonly known as the "liberty of indifference," or "power of contrary choice"—a theory which affirms the freedom of the will, not in the sense that the individual is self-determined, but in the sense that in each volition and at each moment of life, no matter what the previous career of the individual has been, the will is in equipoise, able to choose good or evil. We are born characterless (non pleni), and with no bias towards good or evil (ut sine virtute, ita et sine vitio). It follows that we are uninjured by the sin of Adam, save in so far as the evil example of our predecessors misleads and influences us (non propagine sed exemplo). There is, in fact, no such thing as original sin, sin being a thing of will and not of nature; for if it could be of nature our sin would be chargeable on God the creator. This will, capable of good as of evil, being the natural endowment of man, is found in the heathen as well as in the Christian, and the heathen may therefore perfectly keep such law as they know. But, if all men have this natural ability to do and to be all that is required for perfect righteousness, what becomes of grace, of the aid of the Holy Spirit, and, in a word, of Christianity? Pelagius vacillates considerably in his use of the word "grace." Sometimes he makes it equivalent to natural endowment. Indeed one of his most careful statements is to this effect: "We distinguish three things—the ability, the will, the act (posse, velle, esse). The ability is in nature, and must be referred to God, who has bestowed this on His creature; the other two, the will and the act, must be referred to man, because they flow from the fountain of free will" (Aug., *De gr. Christi*, ch. 4). But at other times he admits a much wider range to grace, so as to make Augustine doubt whether his meaning is not, after all, orthodox. But, when he speaks of grace "sanctifying," "assisting," and so forth, it is only that man may "more easily" accomplish what he could with more difficulty accomplish without grace. A decisive passage occurs in the letter he sent to the see of Rome along with his *Confessio fidei*: "We maintain that free will exists generally in all mankind, in Christians, Jews and Gentiles; they have all equally received it by nature, but in Christians only is it assisted by grace. In others this good of their original creation is naked and unarmed. They shall be judged and condemned because, though possessed of free will, by which they might come to the faith and merit the grace of God, they make an ill use of their freedom; while Christians shall be rewarded because, by using their free will aright, they merit the grace of the Lord and keep His commandments" (ibid. chs. 33, 34). Pelagius allowed to grace everything but the initial determining movement towards salvation. He ascribed to the unassisted human will power to accept and use the proffered salvation of Christ. It was at this point his departure from the Catholic creed could be made apparent: Pelagius maintains, expressly and by implication, that it is the human will which takes the initiative, and is the determining factor in the salvation of the individual; while the Church maintains that it is the divine will that takes the initiative by renewing and enabling the human will to accept and use the aid or grace offered.

Semipelagianism.—It was easy for Augustine to show that this was an "impia opinio"; it was easy for him to expose the defective character of a theory of the will which implied that God was not holy because He is *necessarily* holy; it was easy for him to show that the positions of Pelagius were anti-Scriptural (see AUGUSTINE); but, though his arguments prevailed, they did not wholly convince, and the rise of Semipelagianism—an attempt to hold a middle course between the harshness of Augustinianism and the obvious errors of Pelagianism—is full of significance. This earnest and conciliatory movement discovered itself simultaneously in North Africa and in southern Gaul. In the former Church, which naturally desired to adhere to the views of its own great theologian, the monks of Adrumetum found themselves either sunk to the verge of despair or provoked to licentiousness by his predestinarian teaching. When this was reported to Augustine he wrote two elaborate treatises to show that when God ordains the end He also ordains the means, and if any man is ordained to life eternal he is thereby ordained to holiness and zealous effort. But meanwhile some of the monks themselves had struck out a *via media* which ascribed to God sovereign grace and yet left intact man's responsibility. A similar scheme was adopted by Cassian of Marseilles (hence Semipelagians are often spoken of as *Massilians*), and was afterwards ably advocated by Vincent of Lerins and Faustus of Rhegium. These writers, in opposition to Pelagius, maintained that man was damaged by the fall, and seemed indeed disposed to purchase a certificate of orthodoxy by the abusive epithets they heaped upon Pelagians (ranae, muscae morituræ, &c.). The differentia of Semipelagianism is the tenet that in regeneration, and all that results from it, the divine and the human will are co-operating (synergistic) coefficient factors. After finding considerable acceptance, this theory was ultimately condemned, because it retained the root-principle of Pelagianism—that man has some ability to will good and that the beginning of salvation may be with man. The Councils of Orange and Valence (529), however, which condemned Semipelagianism, did so with the significant restriction that predestination to evil was not to be taught—a restriction so agreeable to the general feeling of the Church that, three centuries after, Gottschalk was sentenced to be degraded from the priesthood, scourged and imprisoned for teaching reprobation. The questions raised by Pelagius continually recur, but, without tracing the strife as sustained by Thomists and Jansenists on the one side and the Jesuits and Arminians on the other, this article can only indicate the general bearing of the controversy on society and the Church.

The anthropology of Pelagius was essentially naturalistic. It threatened to supersede grace by nature, to deny all immediate divine influence, and so to make Christianity practically useless. Pelagius himself did not carry his rationalism through to its issues; but the logical consequence of his system was, as Augustine perceived, the denial of the atonement and other central truths of revealed religion. And, while the Pelagians never existed as a sect separate from the Church Catholic, yet wherever rationalism has infected any part of the Church there Pelagianism has sooner or later appeared; and the term "Pelagian" has been continued to denote views which minimize the effects of the fall and unduly magnify man's natural ability. These views and tendencies have appeared in theologies which are not in other respects rationalistic, as *e.g.* in Arminianism; and their presence in such theologies is explained by the desire to remove everything which might seem to discourage human effort.

It is not easy to determine how far the vices which ate so deeply into the life of the Church of the middle ages were due to the sharpness with which some of the severer features of the Augustinian theology were defined during the Pelagian controversy. The pernicious belief in the magical efficacy of the sacraments and the consequent defective ethical power of religion, the superstitious eagerness to accept the Church's creed without examining or really believing it, the falsity and cruelty engendered and propagated by the idea that in the Church's cause all weapons were justifiable, these vices were undoubtedly due to the belief that the visible church was the sole divinely-appointed repository of grace. And the sharply accentuated tone in which Augustinianism affirmed man's inability quickened the craving for that grace or direct agency of God upon the soul which the Church declared to be needful and administered through her divinely appointed persons and sacraments, and thus brought a decided impulse to the development of the sacerdotal system.

Again, although it may fairly be doubted whether, as Baur supposes, Augustine was permanently tainted with the Manichaean notion of the inherent evil of matter, it can scarcely be questioned that his views on marriage as elicited by the Pelagian controversy gave a considerable impulse to the already prevalent idea of the superiority of virginity. When the Pelagians declared that Augustine's theory of original sin discredited marriage by the implication that even the children of the regenerate were born in sin, he could only reply (*De nuptiis et concupiscentia*) that marriage now cannot partake of the spotless purity of the marriage of unfallen man, and that, though what is evil in concupiscence is made a good use of in marriage, it is still a thing to be ashamed of—not only with the shame of natural modesty (which he does not take into account) but with the shame of guilt. So that, even although he is careful to point out the advantages of marriage, an indelible stigma is still left even on the lawful procreation of children.

"The Pelagians deserve respect," says Harnack, "for their purity of motive, their horror of the Manichaean leaven and the *opus operatum*, their insistence on clearness, and their intention to defend the Deity. But we cannot but decide that their doctrine fails to recognize the misery of sin and evil, that in its deepest roots it is godless, that it knows, and seeks to know, nothing of redemption and that it is dominated by an empty formalism (a notional mythology), which does justice at no single point to actual quantities, and on a closer examination consists of sheer contradictions. In the *form* in which this doctrine was *expressed* by Pelagius—and in fact also by Julian—*i.e.* with all the accommodations to which he condescended, it was not a novelty. But in its fundamental thought it was; or rather, it was an innovation because it abandoned in spite of all accommodations in expression, the pole of the mystical doctrine of redemption, which the Church had steadfastly maintained side by side with the doctrine of freedom."

In the Pelagian controversy some of the fundamental differences between the Eastern and Western theologies appear. The former laid stress on "the supernatural character of Christianity as a fact in the objective world" and developed the doctrines of the Trinity and the Incarnation; the Western emphasized "the supernatural character of Christianity as an agency in the subjective world" and developed the doctrines of sin and grace. All the Greek fathers from Origen to Chrysostum had been jealous for human freedom and loath to make sin a natural power, though of course admitting a general state of sinfulness. The early British monasteries had been connected with the Orient. Pelagius was familiar with the Greek language and theology, and when he came to Rome he was much in the company of Rufinus and his circle who were endeavouring to propagate Greek theology in the Latin Church.

LITERATURE.—Pelagius's *Commentarii in epistolas Pauli, Libellus*

fidei ad Innocentium and *Epistola ad Demetriadem* are preserved in Jerome's works (vol. v. of Martiani's ed., vol. xi. of Vallarsi's). The last-named was also published separately by Semler (Halle, 1775). There are of course many citations in the Anti-Pelagian Treatises of Augustine. On the *Commentaries* see *Journal of Theol. Studies*, vii. 568, viii. 526; an edition is being prepared for the Cambridge *Texts and Studies* by A. Souter.

Pelagius* (Leipzig, 1842); F. Klasen, *Die innere Entwickelung des Pelagianismus* (Freiburg, 1882); B. B. Warfield, *Two Studies in the History of Doctrine* (New York, 1893); A. Harnack, *History of Dogma*, Eng. trans., v. 168–202; F. Loofs, *Dogmengeschischte* and art. in Hauck-Herzog's *Realencyklo. für prot. Theologie u. Kirche* (end of vol. xv.), where a full bibliography is given. (M. D.)

PELASGIANS, a name applied by Greek writers to a prehistoric people whose traces were believed to exist in Greek lands. If the statements of ancient authorities are marshalled in order of their date it will be seen that certain beliefs cannot be traced back beyond the age of this or that author. Though this does not prove that the beliefs themselves were not held earlier, it suggests caution in assuming that they were. In the Homeric poems there are Pelasgians among the allies of Troy: in the catalogue, *Iliad*, ii. 840–843, which is otherwise in strict geographical order, they stand between the Hellespontine towns and the Thracians of south-east Europe, *i.e.* on the Hellespontine border of Thrace. Their town or district is called Larissa and is fertile, and they are celebrated for their spearmanship. Their chiefs are Hippothous and Pylaeus, sons of Lethus son of Teutamus. *Iliad*, x. 428–429, describes their camping ground between the town of Troy and the sea; but this obviously proves nothing about their habitat in time of peace. *Odyssey*, xvii. 175–177, notes Pelasgians in Crete, together with two apparently indigenous and two immigrant peoples (Achaeans and Dorians), but gives no indication to which class the Pelasgians belong. In Lemnos (*Iliad*, vii. 467; xiv. 230) there are no Pelasgians, but a Minyan dynasty. Two other passages (*Iliad*, ii. 681–684; xvi. 233–235) apply the epithet "Pelasgic" to a district called Argos about Mt Othrys in south Thessaly, and to Zeus of Dodona. But in neither case are actual Pelasgians mentioned; the Thessalian Argos is the specific home of Hellenes and Achaeans, and Dodona is inhabited by Perrhaebians and Aenianes (*Iliad*, ii. 750) who are nowhere described as Pelasgian. It looks therefore as if "Pelasgian" were here used connotatively, to mean either "formerly occupied by Pelasgian" or simply "of immemorial age."

Hesiod expands the Homeric phrase and calls Dodona "seat of Pelasgians" (fr. 225); he speaks also of a personal Pelasgus as father of Lycaon, the culture-hero of Arcadia; and a later epic poet, Asius, describes Pelasgus as the first man, whom the earth threw up that there might be a race of men. Hecataeus makes Pelasgus king of Thessaly (expounding *Iliad*, ii. 681–684); Acusilaus applies this Homeric passage to the Peloponnesian Argos, and engrafts the Hesiodic Pelasgus, father of Lycaon, into a Peloponnesian genealogy. Hellanicus a generation later repeats this blunder, and identifies this Argive and Arcadian Pelasgus with the Thessalian Pelasgus of Hecataeus. For Aeschylus (*Supplices* 1, sqq.) Pelasgus is earthborn, as in Asius, and rules a kingdom stretching from Argos to Dodona and the Strymon; but in *Prometheus* 879, the "Pelasgian" land simply means Argos. Sophocles takes the same view (*Inachus*, fr. 256) and for the first time introduces the word "Tyrrhenian" into the story, apparently as synonymous with Pelasgian.

Herodotus, like Homer, has a denotative as well as a connotative use. He describes actual Pelasgians surviving and mutually intelligible (*a*) at Placie and Scylace on the Asiatic shore of the Hellespont, and (*b*) near Crestor. on the Strymon; in the latter area they have "Tyrrhenian" neighbours. He alludes to other districts where Pelasgian peoples lived on under changed names; Samothrace and Antandrus in Troas are probably instances of this. In Lemnos and Imbros he describes a Pelasgian population who were only conquered by Athens shortly before 500 B.C., and in this connexion he tells a story of earlier raids of these Pelasgians on Attica, and of a temporary settlement there of Hellespontine Pelasgians, all dating from a time "when the Athenians were first beginning to count as Greeks." Elsewhere "Pelasgian" in Herodotus connotes anything typical of, or surviving from, the state of things in Greece before the coming of the Hellenes. In this sense all Greece was once "Pelasgic"; the clearest instances of Pelasgian survival in ritual and customs and antiquities are in Arcadia, the "Ionian" districts of north-west Peloponnese, and Attica, which have suffered least from hellenization. In Athens itself the prehistoric wall of the citadel and a plot of ground close below it were venerated in the 5th century as "Pelasgian"; so too Thucydides (ii. 17). We may note that all Herodotean examples of *actual* Pelasgi lie round, or near, the *actual* Pelasgi of Homeric Thrace; that the most distant of these is confirmed by the testimony of Thucydides (iv. 106) as to the Pelasgian and Tyrrhenian population of the adjacent seaboard; also that Thucydides adopts the same general Pelasgian theory of early Greece, with the refinement that he regards the Pelasgian name as originally specific, and as having come gradually into this generic use.

Ephorus, relying on Hesiodic tradition of an aboriginal Pelasgian type in Arcadia, elaborated a theory of the Pelasgians as a warrior-people spreading (like "Aryans") from a "Pelasgian home," and annexing and colonizing all the parts of Greece where earlier writers had found allusions to them, from Dodona to Crete and the Troad, and even as far as Italy, where again their settlements had been recognized as early as the time of Hellanicus, in close connexion once more with "Tyrrhenians."

The copious additional information given by later writers is all by way either of interpretation of local legends in the light of Ephorus's theory, or of explanation of the name "Pelasgoi"; as when Philochorus expands a popular etymology "stork-folk" (πελασγοί—πελαργοί) into a theory of their seasonal migrations; or Apollodorus says that Homer calls Zeus Pelasgian "because he is not far from every one of us," ὅτι τῆς γῆς πέλας ἐστίν. The connexion with Tyrrhenians which began with Hellanicus, Herodotus and Sophocles becomes confusion with them in the 3rd century, when the Lemnian pirates and their Attic kinsmen are plainly styled Tyrrhenians, and early fortress-walls in Italy (like those on the Palatine in Rome) are quoted as "Arcadian" colonies.

Modern writers have either been content to restate or amplify the view, ascribed above to Ephorus, that "Pelasgian" simply means "prehistoric Greek," or have used the name Pelasgian at their pleasure to denote some one element in the mixed population of the Aegean—Thracian, Illyrian (Albanian) or Semitic. G. Sergi (*Origine e diffusione della stirpe mediterranea*, Rome, 1895; Eng. trans. *The Mediterranean Race*, London, 1901), followed by many anthropologists, describes as "Pelasgian" one branch of the Mediterranean or Eur-African race of mankind, and one group of types of skull within that race. The character of the ancient citadel wall at Athens, already mentioned, has given the name "Pelasgic masonry" to all constructions of large unhewn blocks fitted roughly together without mortar, from Asia Minor to Spain.

For another view than that here taken see ACHAEANS; also GREECE: *Ancient History*, § 3, "Homeric Age."

PELEUS, in Greek legend, king of the Myrmidones of Phthia in Thessaly, son of Aeacus, king of Aegina, and brother (or

intimate friend) of Telamon. The two brothers, jealous of the athletic prowess of their step-brother Phocus, slew him; but the crime was discovered, and Peleus and Telamon were banished. Peleus took refuge in Phthia with his uncle Eurytion, who purified him from the guilt of murder, and gave him his daughter Antigone to wife, and a third of the kingdom as her dowry. Having accidentally killed his father-in-law at the Calydonian boar-hunt, Peleus was again obliged to flee, this time to Iolcus, where he was purified by Acastus. The most famous event in the life of Peleus was his marriage with the sea-goddess Thetis, by whom he became the father of Achilles. The story ran that both Zeus and Poseidon had sought her hand, but, Themis (or Prometheus or Proteus) having warned the former that a son of Thetis by Zeus would prove mightier than his father, the gods decided to marry her to Peleus. Thetis, to escape a distasteful union, changed herself into various forms, but at last Peleus, by the instructions of Chiron, seized and held her fast till she resumed her original shape, and was unable to offer further resistance. The wedding (described in the fine *Epithalamium* of Catullus) took place in Chiron's cave on Mt Pelion. Peleus survived both his son Achilles and his grandson Neoptolemus, and was carried away by Thetis to dwell for ever among the Nereids.

See Apollodorus iii. 12, 13; Ovid, *Metam.* xi; Pindar, *Isthmia*, viii. 70, *Nemea*, iv. 101; Catullus, lxiv.; schol. Apoll. Rhod. iv. 816; Euripides, *Andromache*, 1242–1260.

PELEW ISLANDS (Ger. *Palauinseln*, also *Palao*), a group of twenty-six islands in the western Pacific Ocean, between 2° 35′ and 9° N., and 130° 4′ and 134° 40′ E., belonging to Germany. They lie within a coral barrier reef, and in the south the islands are of coral, but in the north of volcanic rocks. They are well wooded, the climate is healthy, and the water-supply good. A few rats and bats represent the indigenous mammals, but the sea is rich in fish and molluscs; and Dr Otto Finsch (*Journ. des Museum Godeffroy*, 1875) enumerated 56 species of birds, of which 12 are peculiar to the group. The total area is 175 sq. m., the largest islands being Babeltop (Babelthuap, Baobeltaob and other variants), Uruktapi (Urukthopel), Korror, Nyaur, Peleliu and Eilmalk (Irakong). The population is about 3100. The natives are Micronesians, and are darker and shorter than their kinsmen, the Caroline Islanders. They usually have the frizzly hair of the Melanesians, and paint their bodies in brilliant colours, especially yellow. The men vary in height from 5 ft. to 5 ft. 5 in., the women from 4 ft. 9 in. to 5 ft. 2 in. The skull shows a strong tendency to brachycephalism. Two curious customs may be noted—the institution of an honourable order bestowed by the king, called *klilt*; and a species of mutual aid society, sometimes confined to women, and possessing considerable political influence. There are five kinds of currency in the islands, consisting of beads of glass and enamel, to which a supernatural origin is ascribed.

The islands were sighted in 1543 by Ruy Lopez de Villalobos, who named named them the Arrecifos. The origin of the name Islas Palaos is doubtful. The islands were bought by Germany from Spain in 1899, and are administered together with the western Carolines, Yap being the administrative centre.

See K. Semper, *Die Palau-Inseln* (Leipzig, 1873); J. S. Kubary, *Die sozialen Einrichtungen der Palauer* (Berlin, 1885); A. A. Marche, *Lupon et Palouan* (Paris, 1887).

PELF, a term now chiefly used of money and always in a derogatory sense. The word originally meant plunder, pillage (O. Fr. *pelfre*, probably from Lat. *pilare*, to deprive of hair, *pilus*), and this significance is still kept in the related word "pilfer," to make petty thefts.

PELHAM, the name of an English family, derived from Pelham in Hertfordshire, which was owned by a certain Walter de Pelham under Edward I., and is alleged to have been in the possession of the same family before the Norman conquest. The family dignities included the barony of Pelham of Laughton (1706–1768), the earldom of Clare (1714–1768), the dukedom of Newcastle (1715–1768), the barony of Pelham of Stanmer from 1762, the earldom of Chichester from 1801 and the earldom of Yarborough from 1837.

John de Pelham, who was one of the captors of John II. of France at Poitiers, acquired land at Winchelsea by his marriage with Joan Herbert, or Finch. His son, John de Pelham (d. 1429), was attached to the party of John of Gaunt and his son Henry IV. In 1393 he received a life appointment as constable of Pevensey Castle, an honour subsequently extended to his heirs male, and he joined Henry on his invasion in 1399, if he did not actually land with him at Ravenspur. He was knighted at Henry's coronation, and represented Sussex in parliament repeatedly during the reign of Henry IV., and again in 1422 and 1427. As constable of Pevensey he had at different times the charge of Edward, duke of York, in 1405; Edmund, earl of March, with his brother Roger Mortimer in 1406; James I. of Scotland in 1414; Sir John Mortimer in 1422, and the queen dowager, Joan of Navarre, from 1418 to 1422. He was constantly employed in the defence of the southern ports against French invasion, and his powers were increased in 1407 by his appointment as chief butler of Chichester and of the Sussex ports, and in 1412 by the grant of the rape of Hastings. He was treasurer of England in 1412–1413, and although he was superseded on the accession of Henry V. he was sent in the next year to negotiate with the French court. He was included among the executors of the wills of Henry IV., of Thomas, duke of Clarence, and of Henry V. He died on the 12th of February 1429, and was succeeded by his son John, who took part in Henry V.'s expedition to Normandy in 1417.

In the reign of Queen Elizabeth Sir William Pelham (*c.* 1530–1587), third son of Sir William Pelham (d. 1538) of Laughton, Sussex, became lord justice of Ireland. He was captain of pioneers at the siege of Leith in 1560, and served at the siege of Havre in 1562, and with Coligny at Caen in 1563. He then returned to Havre, at that time occupied by English troops, and was one of the hostages for the fulfilment of its surrender to Charles IX. in 1564. After his return to England he fortified Berwick among other places, and was appointed lieutenant-general of ordnance. He was sent to Ireland in 1579, when he was knighted by Sir William Drury, the lord justice. Drury died in October, and Pelham was provisionally made his successor, an appointment subsequently confirmed by Elizabeth. Alarmed by the proceedings of Gerald Fitzgerald, 15th earl of Desmond, and his brother John Desmond, he proclaimed the earl a traitor. Elizabeth protested strongly against Pelham's action, which was justified by the sack of Youghal by Desmond. Thomas Butler, 10th earl of Ormonde, was entrusted with the campaign in Munster, but Pelham joined him in February 1580, when it was believed that a Spanish descent was about to be made in the south-west. The English generals laid waste northern Kerry, and proceeded to besiege Carrigafoyle Castle, which they stormed, giving no quarter to man, woman or child. Other strongholds submitted on learning the fate of Carrigafoyle, and were garrisoned by Pelham, who hoped with the concourse of Admiral Winter's fleet to limit the struggle to Kerry. He vainly sought help from the gentry of the county, who sympathized with Desmond, and were only brought to submission by a series of "drives." After the arrival of the new deputy, Lord Grey of Wilton, Pelham returned to England on the ground of health. He had retained his office as lieutenant-general of ordnance, and was now made responsible for debts incurred during his absence. Leicester desired his services in the Netherlands, but it was only after much persuasion that Elizabeth set him free to join the army by accepting a mortgage on his estates as security for his liabilities. The favour shown by Leicester to Pelham caused serious jealousies among the English officers, and occasioned a camp brawl in which Sir Edward Norris was injured. Pelham was wounded at Doesburg in 1586, and accompanied Leicester to England in 1587. Returning to the Netherlands in the same year he died at Flushing on the 24th of November 1587. His half-brother, Sir Edmund Pelham (d. 1606), chief baron of the exchequer in Ireland, was the first English judge to go on circuit in Ulster.

Sir William married Eleanor, daughter of Henry Neville, earl of Westmorland, and was the ancestor of the Pelhams of Brocklesby, Lincolnshire. In the fourth generation Charles Pelham died in 1763 without heirs, leaving his estates to his great-nephew Charles Anderson (1749–1823), who thereupon assumed the additional name of Pelham, and was created Baron Yarborough in 1794. His son Charles (1781–1846), who was for many years commodore of the Royal Yacht Squadron, was created earl of Yarborough and Baron Worsley in 1837. Charles Alfred Worsley, the 4th earl (b. 1859), exchanged the name of Anderson-Pelham for that of Pelham in 1905. He married in 1886 Marcia Lane-Fox, eldest daughter of the 12th Baron Conyers, who became in 1892 Baroness Conyers in her own right.

Sir NICHOLAS PELHAM (1517–1560), an elder half-brother of Sir William Pelham, defended Seaford against the French in 1545, and sat for Arundel and for Sussex in parliament. He was the ancestor of the earls of Chichester. His second son, Sir THOMAS PELHAM (d. 1624), was created a baronet in 1611. His descendant, Sir THOMAS PELHAM, 4th baronet (*c.* 1650–1712), represented successively East Grinstead, Lewes and Sussex in parliament, and was raised to the House of Lords as Baron Pelham of Laughton in 1706. By his second marriage with Grace (d. 1700), daughter of Gilbert Holles, 3rd earl of Clare, and sister of John Holles, duke of Newcastle, he had five daughters, and two sons—Thomas Pelham, earl of Clare, duke of Newcastle-on-Tyne and 1st duke of Newcastle-under-Lyme (see NEWCASTLE, DUKES OF), and Henry Pelham (*q.v.*). The duke of Newcastle died without heirs, and the dukedom of Newcastle-under-Lyme descended to his nephew, Henry Fiennes Clinton, afterwards known as Pelham-Clinton, and his heirs, but the barony of Pelham of Laughton became extinct. In 1762 Newcastle had been created Baron Pelham of Stanmer, with reversion to his cousin and heir-male, THOMAS PELHAM (1728–1805), who became commissioner of trade (1754), lord of the admiralty (1761–1764), comptroller of the household (1765–1774), privy councillor (1765), surveyor-general of the customs of London (1773–1805), chief justice in eyre (1774–1775) and keeper of the wardrobe (1775–1782), and was created earl of Chichester in 1801. His third son, George (1766–1827), was successively bishop of Bristol, Exeter and Lincoln. THOMAS PELHAM, 2nd earl of Chichester (1756–1826), son of the 1st earl, was surveyor-general of ordnance in Lord Rockingham's ministry (1782), and chief secretary for Ireland in the coalition ministry of 1783. In 1795 he became Irish chief secretary under Pitt's government, retiring in 1798; he was home secretary from July 1801 to August 1803 under Addington, who made him chancellor of the duchy of Lancaster in 1803. Pelham went out of office in 1804, and in the next year succeeded to the earldom. He was joint postmaster-general from 1807 to 1823, and for the remaining three years of his life postmaster-general. His son and heir, HENRY THOMAS PELHAM (1804–1886), 3rd earl, was an ecclesiastical commissioner from 1850 until his death, and was greatly interested in various religious, philanthropic and educational movements; and two other sons were well known men—Frederick Thomas Pelham (1808–1861), who became a rear-admiral in 1858, and subsequently lord-commissioner of the admiralty, and John Thomas Pelham (1811–1894), who was bishop of Norwich from 1857 to 1893. The third earl's son, Walter John Pelham (1838–1892), succeeded his father in 1886, and his nephew Jocelyn Brudenell Pelham (b. 1871) became 6th earl of Chichester in 1905.

PELHAM, HENRY (1696–1754), prime minister of England, younger brother of Thomas Holles Pelham, duke of Newcastle, was born in 1696. He was a younger son of Thomas, 1st Baron Pelham of Laughton (1650–1712; cr. 1706) and of Lady Grace Holles, daughter of the 3rd earl of Clare (see above). He was educated by a private tutor and at Christ Church, Oxford, which he entered in July 1710. As a volunteer he served in Dormer's regiment at the battle of Preston in 1715, spent some time on the Continent, and in 1717 entered parliament for Seaford, Sussex. Through strong family influence and the recommendation of Walpole he was chosen in 1721 a lord of the Treasury. The following year he was returned for Sussex county. In 1724 he entered the ministry as secretary of war, but this office he exchanged in 1730 for the more lucrative one of paymaster of the forces. He made himself conspicuous by his support of Walpole on the question of the excise, and in 1743 a union of parties resulted in the formation of an administration in which Pelham was prime minister, with the office of chancellor of the exchequer; but rank and influence made his brother, the duke of Newcastle, very powerful in the cabinet, and, in spite of a genuine attachment, there were occasional disputes between them, which led to difficulties. Being strongly in favour of peace, Pelham carried on the war with languor and indifferent success, but the country, wearied of the interminable struggle, was disposed to acquiesce in his foreign policy almost without a murmur. The king, thwarted in his favourite schemes, made overtures in 1746 to Lord Bath, but his purpose was upset by the resignation of the two Pelhams (Henry and Newcastle), who, however, at the king's request, resumed office. Pelham remained prime minister till his death on the 6th of March 1754, when his brother succeeded him. His very defects were among the chief elements of Pelham's success, for one with a strong personality, moderate self-respect, or high conceptions of statesmanship could not have restrained the discordant elements of the cabinet for any length of time. Moreover, he possessed tact and a thorough acquaintance with the forms of the house. Whatever quarrels or insubordination might exist within the cabinet, they never broke out into open revolt. Nor can a high degree of praise be denied to his financial policy, especially his plans for the reduction of the national debt and the simplification and consolidation of its different branches. He had married in 1726 Lady Catherine Manners, daughter of the 2nd duke of Rutland; and one of his daughters married Henry Fiennes Clinton, 2nd duke of Newcastle.

See W. Coxe, *Memoirs of the Pelham Administration*, (2 vols., 1829). For the family history see Lower, *Pelham Family* (1873); also the Pelham and Newcastle MSS. in the British Museum.

PELHAM, HENRY FRANCIS (1846–1907), English scholar and historian, was born at Berg Apton, Norfolk, on the 19th of September 1846, son of the Hon. John Thomas Pelham (1811–1894), bishop of Norwich, third son of the 2nd earl of Chichester. He was educated at Harrow and at Trinity College, Oxford, where he took a first class in *literae humaniores* in 1869. He was a tutor of Exeter College from 1869 to 1890. In 1887 he became university reader in ancient history, and two years later was elected to the Camden professorship. He became curator of the Bodleian library in 1892, and in 1897 president of Trinity College. He was also a fellow of Brasenose College, honorary fellow of Exeter, a fellow of the British Academy and of other learned societies, and a governor of Harrow School. His chief contribution to ancient history was his article on Roman history in the 9th edition of the *Encyclopaedia Britannica* (1886), which was republished with additions as the *Outlines of Roman History* (1890). His university lectures, though perhaps lacking in inspiration, were full of original research and learning. His death on the 13th of February 1907 not only prevented the publication in systematic form of his own important researches, but also delayed the appearance of much that had been left in MS. by H. Furneaux and A. H. J. Greenidge, and was at the time under his charge. Apart from the *Outlines* he published only *The Imperial Domains and the Colonate* (1890), *The Roman Frontier System* (1895), and articles in periodicals of which the most important was an article in the *Quarterly Review* on the early Caesars (April, 1905). He did much for the study of archaeology at Oxford, materially assisted the Hellenic Society and the British School at Athens, and was one of the founders of the British School at Rome. He married in 1873 Laura Priscilla, daughter of Sir Edward North Buxton.

PELIAS, in Greek legend, son of Poseidon and Tyro, daughter of Salmoneus. Because Tyro afterwards married her father's brother Cretheus, king of Iolcus in Thessaly, to whom she bore Aeson, Pheres and Amythaon, Pelias was by some thought to be

the son of Cretheus. He and his twin-brother Neleus were exposed by their mother, but were nurtured by a herdsman. When grown to manhood they were acknowledged by their mother. After the death of Cretheus, Pelias made himself master of the kingdom of Iolous, having previously quarrelled with Neleus, who removed to Messenia, where he founded Pylos. In order to rid himself of Jason, Pelias sent him to Colchis in quest of the golden fleece, and took advantage of his absence to put to death his father, Aeson, his mother and brother. When Jason returned he sought to avenge the death of his parents, and Medea persuaded the daughters of Pelias to cut in pieces and boil their father, assuring them that he would thus be restored to youth. Acastus, son of Pelias, drove out Jason and Medea and celebrated funeral games in honour of his father, which were celebrated by the poet Stesichorus and represented on the chest of Cypselus. The death of Pelias was the subject of Sophocles' *Rhizotomoi* (Root-cutters), and in the *Tyro* he treated another portion of the legend. *Peliades* (the daughters of Pelias) was the name of Euripides' first play.

PELICAN (Fr. *Pélican*; Lat. *Pelecanus* or *Pelicanus*), a large fish-eating water-fowl, remarkable for the enormous pouch formed by the extensible skin between the lower jaws of its long, and apparently formidable but in reality very weak, bill. The ordinary pelican, the *Onocrotalus* of the ancients, to whom it was well known, and the *Pelecanus onocrotalus* of ornithologists, is a very abundant bird in some districts of south-eastern Europe, south-western Asia and north-eastern Africa, occasionally straying, it is believed, into the northern parts of Germany and France; but the possibility of such wanderers having escaped from confinement is always to be regarded,[1] since few zoological gardens are without examples. Its usual haunts are the shallow margins of the larger lakes and rivers, where fishes are plentiful, since it requires for its sustenance a vast supply of them. The nest is formed among reeds, placed on the ground and lined with grass. Therein two eggs, with white, chalky shells, are commonly laid. The young during the first twelvemonth are of a greyish-brown, but when mature almost the whole plumage, except the black primaries, is white, deeply suffused by a rich blush of rose or salmon-colour, passing into yellow on the crest and lower part of the neck in front. A second and somewhat larger species, *Pelecanus crispus*, also inhabits Europe, but has a more eastern distribution. This, when adult, is readily distinguishable from the ordinary bird by the absence of the blush from its plumage, and by the curled feathers that project from and overhang each side of the head, which with some difference of coloration of the bill, pouch, bare skin round the eyes and irides give it a wholly distinct expression. Two specimens of the humerus have been found in the English fens (*Ibis*, 1868, p. 363; *Proc. Zool. Society*, 1871, p. 702), thus proving the existence of the bird in England at no very distant period, and one of them being that of a young example points to its having been bred in this country. It is possible from their large size that they belonged to *P. crispus*. Ornithologists have been much divided in opinion as to the number of living species of the genus *Pelecanus* (cf. *op. cit.*, 1868, p. 264; 1869, p. 571; 1871, p. 631)—the estimate varying from six to ten or eleven; but the former is the number recognized by M. Dubois (*Bull. Mus. de Belgique*, 1883). North America has one, *P. erythrorhynchus*, very similar to *P. onocrotalus* both in appearance and habits, but remarkable for a triangular, horny excrescence developed on the ridge of the male's bill in the breeding season, which falls off without leaving trace of its existence when that is over. Australia has *P. conspicillatus*, easily distinguished by its black tail and wing-coverts. Of more marine habit are *P. philippensis* and *P. fuscus*, the former having a wide range in southern Asia, and, it is said, reaching Madagascar, and the latter common on the coasts of the warmer parts of both North and South America.

The genus *Pelecanus* as instituted by Linnaeus included the cormorant (*q.v.*) and gannet (*q.v.*) as well as the true pelicans, and for a long while these and some other distinct groups, as the snake-birds (*q.v.*), frigate-birds (*q.v.*) and tropic-birds (*q.v.*), which have all the four toes of the foot connected by a web, were regarded as forming a single family, *Pelecanidae*; but this name has now been restricted to the pelicans only, though all are still usually associated in the suborder *Steganopodes* of Ciconiiform birds. It may be necessary to state that there is no foundation for the venerable legend of the pelican feeding her young with blood from her own breast, which has given it an important place in ecclesiastical heraldry, except that, as A. D. Bartlett suggested (*Proc. Zool. Society*, 1869, p. 146), the curious bloody secretion ejected from the mouth of the flamingo may have given rise to the belief, through that bird having been mistaken for the "Pelican of the wilderness."[2] (A. N.)

PELION, a wooded mountain in Thessaly in the district of Magnesia, between Volo and the east coast. Its highest point (mod. Plessidi) is 5340 ft. It is famous in Greek mythology; the giants are said to have piled it on Ossa in order to scale Olympus, the abode of the gods; it was the home of the centaurs, especially of Chiron, who had a cave near its summit, and educated many youthful heroes; the ship "Argo" was built from its pine-woods. On its summit was an altar of Zeus Actaeus, in whose honour an annual festival was held in the dog-days, and worshippers clad themselves in skins.

PELISSE (through the Fr. from Lat. *pellicia*: sc. *vestis*, a garment made of fur, *pellis*, skin), properly a name of a cloak made of or lined with fur, hence particularly used of the fur-trimmed "dolman" worn slung from the shoulders by hussar regiments. The word is now chiefly employed as the name of a long-sleeved cloak of any material worn by women and children.

PÉLISSIER, AIMABLE JEAN JACQUES (1794–1864), duke of Malakoff, marshal of France, was born on the 6th of November 1794 at Maromme (Seine Inférieure), of a family of prosperous artisans or yeoman, his father being employed in a powder-magazine. After attending the military college of La Flèche and the special school of St Cyr, he in 1815 entered the army as sub-lieutenant in an artillery regiment. A brilliant examination in 1819 secured his appointment to the staff. He served as aide-de-camp in the Spanish campaign of 1823, and in the expedition to the Morea in 1828–29. In 1830 he took part in the expedition to Algeria, and on his return was promoted to the rank of *chef d'escadron*. After some years' staff service in Paris he was again sent to Algeria as chief of staff of the province of Oran with the rank of lieutenant-colonel, and remained there till the Crimean War, taking a prominent part in many important operations. The severity of his conduct in suffocating a whole Arab tribe in the Dahra or Dahna caves, near Mustaganem, where they had taken refuge (June 18, 1845), awakened such indignation in Europe that Marshal Soult, the minister of war, publicly expressed his regret; but Marshal Bugeaud, the governor-general of Algeria, not only gave it his approval, but secured for Pélissier the rank of general of brigade, which he held till 1850, when he was promoted general of division. After the battles of October and November 1854 before Sevastopol, Pélissier was sent to the Crimea, where on the 16th of May 1855 he succeeded Marshal Canrobert as commander-in-chief of the French forces before Sevastopol (see CRIMEAN WAR). His command was marked by relentless pressure of the enemy and unalterable determination to conduct the campaign without interference from Paris. His perseverance was crowned with

[1] This caution was not neglected by the prudent, even so long ago as Sir Thomas Browne's days; for he, recording the occurrence of a pelican in Norfolk, was careful to notice that about the same time one of the pelicans kept by the king (Charles II.) in St James's Park, had been lost.

[2] The legend was commonly believed in the middle ages. Epiphanius, bishop of Constantia, in his *Physiologus* (1588), writes that the female bird, in cherishing her young, wounds them with loving, and pierces their sides, and they die. After three days the male pelican comes and finds them dead, and his heart is pained. He smites his own side, and as he stands over the wounds of the dead young ones the blood trickles down, and thus are they made alive again. The pelican "in his piety"—*i.e.* in this pious act of reviving his offspring—was a common subject for 15th-century emblem books; it became a symbol of self-sacrifice, a type of Christian redemption and of the Eucharistic doctrine. The device was adopted by Bishop Fox in 1516 for his new college of Corpus Christi, Oxford.—[H. Ch.]

success in the storming of the Malakoff on the 8th of September. On the 12th he was promoted to be marshal. On his return to Paris he was named senator, created duke of Malakoff (July 22, 1856), and rewarded with a grant of 100,000 francs per annum. From March 1858 to May 1859 he was French ambassador in London, whence he was recalled to take command of the army of observation on the Rhine. In the same year he became grand chancellor of the Legion of Honour. In 1860 he was appointed governor-general of Algeria, and he died there on the 22nd of May 1864.

See Marbaud, *Le Maréchal Pélissier* (1863); Castille, *Portraits historiques*, 2nd series (1859).

PELL, JOHN (1610–1685), English mathematician, was born on the 1st of March 1610 at Southwick in Sussex, where his father was minister. He was educated at Steyning, and entered Trinity College, Cambridge, at the age of thirteen. During his university career he became an accomplished linguist, and even before he took his M.A. degree (in 1630) corresponded with Henry Briggs and other mathematicians. His great reputation and the influence of Sir William Boswell, the English resident, with the states-general procured his election in 1643 to the chair of mathematics in Amsterdam, whence he removed in 1646, on the invitation of the prince of Orange, to Breda, where he remained till 1652.

From 1654 to 1658 Pell acted as Cromwell's political agent to the Protestant cantons of Switzerland. On his return to England he took orders and was appointed by Charles II. to the rectory of Fobbing in Essex, and in 1673 he was presented by Bishop Sheldon to the rectory of Laindon in the same county. His devotion to mathematical science seems to have interfered alike with his advancement in the Church and with the proper management of his private affairs. For a time he was confined as a debtor in the king's bench prison. He lived, on the invitation of Dr Whistler, for a short time in 1682 at the College of Physicians, but died on the 12th of December 1685 at the house of Mr Cothorne, reader of the church of St Giles-in-the Fields. Many of Pell's manuscripts fell into the hands of Dr Busby, master of Westminster School, and afterwards came into the possession of the Royal Society; they are still preserved in something like forty folio volumes, which contain, not only Pell's own memoirs, but much of his correspondence with the mathematicians of his time.

The Diophantine analysis was a favourite subject with Pell; he lectured on it at Amsterdam; and he is now best remembered for the indeterminate equation $ax^2+1 = y^2$, which is known by his name. This problem was proposed by Pierre de Fermat first to Bernhard Frenicle de Bessy, and in 1657 to all mathematicians. Pell's connexion with the problem simply consists of the publication of the solutions of John Wallis and Lord Brounker in his edition of *Branker's Translation of Rhonius's Algebra* (1668). His chief works are: *Astronomical History of Observations of Heavenly Motions and Appearances* (1634); *Ecliptica prognostica* (1634); *Controversy with Longomontanus concerning the Quadrature of the Circle* (1646 ?); *An Idea of the Mathematics*, 12mo (1650); *A Table of Ten Thousand Square Numbers* (fol.; 1672).

PELLA, the capital of ancient Macedonia under Philip II. (who transferred the seat of government hither from Edessa) and Alexander the Great, who was born here. It seems to have retained some importance up to the time of Hadrian. Scanty remains exist and some springs in the neighbourhood are still known as the baths of Pel. The site (identified by Leake) is occupied by the village of Neochori (Turk. *Yeni-Keui*) about 32 m. north-west of Salonika.

PELLAGRA (Ital. *pelle agra*, smarting skin), the name given, from one of its early symptoms, to a peculiar disease, of comparatively modern origin. For some time it was supposed to be practically confined to the peasantry in parts of Italy (particularly Lombardy) and France, and in the Asturias (*mal de la rosa*), Rumania and Corfu. But it has recently been identified in various outlying parts of the British Empire (Barbadoes, India) and in both Lower and Upper Egypt; also among the Zulus and Basutos. In the United States sporadic cases had been observed up to 1906, but since then numerous cases have been reported. It is in Italy, however, that it has been most prevalent. The malady is essentially chronic in character. The indications usually begin in the spring of the year, declining towards autumn, and recurring with increasing intensity and permanence in the spring seasons following. A peasant who is acquiring the malady feels unfit for work, suffers from headaches, giddiness, singing in the ears, a burning of the skin, especially in the hands and feet, and diarrhoea. At the same time a red rash appears on the skin, of the nature of erysipelas, the red or livid spots being tense and painful, especially where they are directly exposed to the sun. About July or August of the first season these symptoms disappear, the spots on the skin remaining rough and dry. The spring attack of the year following will probably be more severe and more likely to leave traces behind it; with each successive year the patient becomes more like a mummy, his skin shrivelled and sallow, or even black at certain spots, as in Addison's disease, his angles protruding, his muscles wasted, his movements slow and languid, and his sensibility diminished. Meanwhile there are more special symptoms relating to the nervous system, including drooping of the eyelid, dilatation of the pupil, and other disorders of vision, together with symptoms relating to the digestive system, such as a red and dry tongue, a burning feeling in the mouth, pain on swallowing, and diarrhoea. After a certain stage the disease passes into a profound disorganization of the nervous system; there is a tendency to melancholy, imbecility, and a curious mummified condition of body. After death a general tissue degeneration is observed.

The causation of this obscure disease has recently come up for new investigation in connexion with the new work done in relation to sleeping-sickness and other tropical diseases. So long as it was supposed to be peculiar to the Italian peasantry, it was associated simply with their staple diet, and was regarded as due to the eating of mouldy maize. It was by his views in this regard that Lombroso (*q.v.*) first made his scientific reputation. But the area of maize consumption is now known to be wider than that of pellagra, and pellagra is found where maize is at least not an ordinary diet. In 1905 Dr L. W. Sambon, at the meeting of the British Medical Association, suggested that pellagra was probably protozoal in origin, and subsequently he announced his belief that the protozoon was communicated by sand-flies, just as sleeping-sickness by the tsetse-fly; and this opinion was supported by the favourable action of arsenic in the treatment of the disease. His hypothesis was endorsed by Sir Patrick Manson, and in January 1910 an influential committee was formed, to enable Dr Sambon to pursue his investigations in a pellagrous area.

PELLETAN, CHARLES CAMILLE (1846–), French politician and journalist, was born in Paris on the 28th of June 1846, the son of Eugène Pelletan (1813–1884) a writer of some distinction and a noted opponent of the Second Empire. Camille Pelletan was educated in Paris, passed as licentiate in laws, and was qualified as an "archiviste paléographe." At the age of twenty he became an active contributor to the press, and a bitter critic of the Imperial Government. After the war of 1870–71 he took a leading place among the most radical section of French politicians, as an opponent of the "opportunists" who continued the policy of Gambetta. In 1880 he became editor of *Justice*, and worked with success to bring about a revision of the sentences passed on the Communards. In 1881 he was chosen member for the tenth arrondissement of Paris, and in 1885 for the Bouches du Rhone, being re-elected in 1889, 1893 and 1898; and he was repeatedly chosen as "reporter," to the various bureaus. During the Nationalist and Dreyfus agitations he fought vigorously on behalf of the Republican government and when the coalition known as the "Bloc" was formed he took his place as a Radical leader. He was made minister of marine in the cabinet of M. Combes, June 1902 to January 1905, but his administration was severely criticized, notably by M. de Lanessan and other naval experts. During the great sailors' strike at Marseilles in 1904 he showed pronounced sympathy with the socialistic aims and methods of the strikers, and a strong feeling was aroused that

his Radical sympathies tended to a serious weakening of the navy and to destruction of discipline. A somewhat violent controversy resulted, in the course of which M. Pelletan's indiscreet speeches did him no good; and he became a common subject for ill-natured caricatures. On the fall of the Combes ministry he became less prominent in French politics.

PELLICANUS, CONRAD (1478–1556), German theologian, was born at Ruffach in Alsace, on the 8th of January 1478. His German name, Kürsner, was changed to Pellicanus by his mother's brother Jodocus Gallus, an ecclesiastic connected with the university of Heidelberg, who supported his nephew for sixteen months at the university in 1491–1492. On returning to Ruffach, he taught gratis in the Minorite convent school that he might borrow books from the library, and in his sixteenth year resolved to become a friar. This step helped his studies, for he was sent to Tübingen in 1496 and became a favourite pupil of the guardian of the Minorite convent there, Paulus Scriptoris, a man of considerable general learning. There seems to have been at that time in south-west Germany a considerable amount of sturdy independent thought among the Franciscans; Pellicanus himself became a Protestant very gradually, and without any such revulsion of feeling as marked Luther's conversion. At Tübingen the future "apostate in three languages" was able to begin the study of Hebrew. He had no teacher and no grammar; but Paulus Scriptoris carried him a huge codex of the prophets on his own shoulders all the way from Mainz. He learned the letters from the transcription of a few verses in the *Star of the Messiah* of Petrus Niger, and, with a subsequent hint or two from Reuchlin, who also lent him the grammar of Moses Kimḥi, made his way through the Bible for himself with the help of Jerome's Latin. He got on so well that he was not only a useful helper to Reuchlin but anticipated the manuals of the great Hebraist by composing in 1501 the first Hebrew grammar in the European tongue. It was printed in 1503, and afterwards included in Reysch's *Margarita philosophica*. Hebrew remained a favourite study to the last. Pellican's autobiography describes the gradual multiplication of accessible books on the subject, and he not only studied but translated a vast mass of rabbinical and Talmudic texts, his interest in Jewish literature being mainly philological. The chief fruit of these studies is the vast commentary on the Bible (Zürich, 7 vols., 1532–1539), which shows a remarkably sound judgment on questions of the text, and a sense for historical as opposed to typological exegesis.

Pellicanus became priest in 1501 and continued to serve his order at Ruffach, Pforzheim, and Basel till 1526. At Basel he did much laborious work for Froben's editions, and came to the conclusion that the Church taught many doctrines of which the early doctors of Christendom knew nothing. He spoke his views frankly, but he disliked polemic; he found also more toleration than might have been expected, even after he became active in circulating Luther's books. Thus, supported by the civic authorities, he remained guardian of the convent of his order at Basel from 1519 till 1524, and even when he had to give up his post, remained in the monastery for two years, professing theology in the university. At length, when the position was becoming quite untenable, he received through Zwingli a call to Zürich as professor of Greek and Hebrew, and formally throwing off his monk's habit, entered on a new life. Here he remained till his death on the 6th of April 1556.

Pellicanus's scholarship, though not brilliant, was really extensive; his sound sense and his singularly pure and devoted character gave him a great influence. He was remarkably free from the pedantry of the time, as is shown by his views about the use of the German vernacular as a vehicle of culture (*Chron.* 135, 36). As a theologian his natural affinities were with Zwingli, with whom he shared the advantage of having grown up to the views of the Reformation, by the natural progress of his studies and religious life. Thus he never lost his sympathy with humanism and with its great German representative, Erasmus.

Pellicanus's Latin autobiography (*Chronicon C.P.R.*) is one of the most interesting documents of the period. It was first published by Riggenbach in 1877, and in this volume the other sources for his life are registered. See also Emil Silberstein, *Conrad Pellicanus; ein Beitrag zur Geschichte des Studiums der hebr. Sprache* (Berlin, 1900).

PELLICIER, GUILLAUME (*c.* 1490–1568), French prelate and diplomatist, was educated by his uncle, the bishop of Maguelonne, whom he succeeded in 1529. In 1536 he had the seat of his bishopric transferred to Montpellier. Appointed ambassador at Venice in 1539, he fulfilled his mission to the entire satisfaction of Francis I., but on the discovery of the system of espionage he had employed the king had to recall him in 1542. Returning to his diocese, he was imprisoned in the château of Beaucaire for his tolerance of the Reformers, so he replaced his former indulgence by severity, and the end of his episcopate was disturbed by religious struggles. He was a man of wide learning, a humanist and a friend of humanists, and took a keen interest in the natural sciences.

See J. Zeller, *La Diplomatie française . . . d'après la correspondance de G. Pellicier* (Paris, 1881); and A. Tausserat-Radel, *Correspondance politique de Guillaume Pellicier* (Paris, 1899).

PELLICO, SILVIO (1788–1854), Italian dramatist, was born at Saluzzo in Piedmont on the 24th of June 1788, the earlier portion of his life being passed at Pinerolo and Turin under the tuition of a priest named Manavella. At the age of ten he composed a tragedy under the inspiration of Caesarotti's translation of the Ossianic poems. On the marriage of his twin sister Rosina with a maternal cousin at Lyons he went to reside in that city, devoting himself during four years to the study of French literature. He returned in 1810 to Milan, where he became professor of French in the Collegio degli Orfani Militari. His tragedy *Francesca da Rimini*, was brought out with success by Carlotta Marchionni at Milan in 1818. Its publication was followed by that of the tragedy *Eufemio da Messina*, but the representation of the latter was forbidden. Pellico had in the meantime continued his work as tutor, first to the unfortunate son of Count Briche, and then to the two sons of Count Porro Lambertenghi. He threw himself heartily into an attempt to weaken the hold of the Austrian despotism by indirect educational means. Of the powerful literary executive which gathered about Counts Porro and Confalonieri, Pellico was the able secretary—the management of the *Conciliatore*, which appeared in 1818 as the organ of the association, resting largely upon him. But the paper, under the censorship of the Austrian officials, ran for a year only, and the society itself was broken up by the government. In October 1820 Pellico was arrested on the charge of carbonarism and conveyed to the Santa Margherita prison. After his removal to the Piombi at Venice in February 1821, he composed several *Cantiche* and the tragedies *Ester d'Engaddi* and *Iginia d'Asti*. The sentence of death pronounced on him in February 1822 was finally commuted to fifteen years *carcere duro*, and in the following April he was placed in the Spielberg at Brünn. His chief work during this part of his imprisonment was the tragedy *Leoniero da Dertona*, for the preservation of which he was compelled to rely on his memory. After his release in 1830 he commenced the publication of his prison compositions, of which the *Ester* was played at Turin in 1831, but immediately suppressed. In 1832 appeared his *Gismonda da Mendrizio*, *Erodiade*, and the *Leoniero*, under the title of *Tre nuovi tragedie*, and in the same year the work which gave him his European fame, *Le Mie prigioni*, an account of his sufferings in prison. The last gained him the friendship of the Marchesa di Barolo, the reformer of the Turin prisons, and in 1834 he accepted from her a yearly pension of 1200 francs. His tragedy *Tommaso Moro* had been published in 1833, his most important subsequent publication being the *Opere inedite* in 1837. On the decease of his parents in 1838 he was received into the Casa Barolo, where he remained till his death, assisting the marchesa in her charities, and writing chiefly upon religious themes. Of these works the best known is the *Dei Doveri degli uomini*, a series of trite maxims which do honour to his piety rather than to his critical judgment. A fragmentary biography of the marchesa by Pellico was published in Italian and English after her death. He died on the 31st of January 1854, and was

buried in the Campo Santo at Turin. His writings are defective in virility and breadth of thought, and his tragedies display neither the insight into character nor the constructive power of a great dramatist. It is in the simple narrative and naïve egotism of *Le Mie prigioni* that he has established his strongest claim to remembrance, winning fame by his misfortunes rather than by his genius.

See Piero Maroncelli, *Addizioni alle mie prigioni* (Paris, 1834); the biographies by Latour; Gabriele Rossetti; Didier, *Revue des deux mondes* (September 1842); De Loménie, *Galerie des contemp. illustr.* iv. (1842); Chiala (Turin, 1852); Nollet-Fabert (1854); Giorgio Briano (1854); Bourdon (1868); Rivieri (1899-1901).

PELLISSON, PAUL (1624–1693), French author, was born at Béziers on the 30th of October 1624, of a distinguished Calvinist family. He studied law at Toulouse, and practised at the bar of Castres. Going to Paris with letters of introduction to Valentin Conrart, who was a co-religionist, he became through him acquainted with the members of the academy. Pellisson undertook to be their historian, and in 1653 published a *Relation contenant l'histoire de l'académie française*. This panegyric was rewarded by a promise of the next vacant place and by permission to be present at their meetings. In 1657 Pellisson became secretary to the minister of finance, Nicolas Fouquet, and when in 1661 the minister was arrested, his secretary was imprisoned in the Bastille. Pellisson had the courage to stand by his fallen patron, in whose defence he issued his celebrated *Mémoire* in 1661, with the title *Discours au roi, par un de ses fidèles sujets sur le procès de M. de Fouquet*, in which the facts in favour of Fouquet are marshalled with great skill. Another pamphlet, *Seconde défense de M. Fouquet*, followed. Pellisson was released in 1666, and from this date sought the royal favour. He became historiographer to the king, and in that capacity wrote a fragmentary *Histoire de Louis XIV.*, covering the years 1660 to 1670. In 1670 he was converted to Catholicism and obtained rich ecclesiastical preferment. He died on the 7th of February 1693. He was very intimate with Mlle de Scudéry, in whose novels he figures as Herminius and Acante. His sterling worth of character made him many friends and justified Bussy-Rabutin's description of him as "encore plus honnête homme que bel esprit."

See Sainte-Beuve, *Causeries du lundi*, vol. xiv.; and F. L. Marcon, *Étude sur la vie et les œuvres de Pellisson* (1859).

PELLITORY, in botany, the common name for a small hairy perennial herb which grows on old walls, hedgebanks and similar localities, and is known botanically as *Parietaria officinalis* (Lat. *paries*, a wall). It has a short woody rootstock from which spring erect or spreading stems 1 to 2 ft. long, bearing slender leafy branches, and axillary clusters of small green flowers. It belongs to the nettle order (*Urticaceae*), and is nearly allied to the nettle, *Urtica*, but its hairs are not stinging.

PELLOUX, LUIGI (1839–), Italian general and politician, was born on the 1st of March 1839, at La Roche, in Savoy, of parents who retained their Italian nationality when Savoy was annexed to France. Entering the army as lieutenant of artillery in 1857, he gained the medal for military valour at the battle of Custozza in 1866, and in 1870 commanded the brigade of artillery which battered the breach in the wall of Rome at Porta Pia. He was elected to the chamber in 1881 as deputy for Leghorn, which he represented until 1895, and joined the party of the Left. He had entered the war office in 1870, and in 1880 became general secretary, in which capacity he introduced many useful reforms in the army. After a succession of high military commands he received the appointment of chief of the general staff in 1896. He was minister of war in the Rudini and Giolitti cabinets of 1891–1893. In July 1896 he resumed the portfolio of war in the Rudini cabinet, and was appointed senator. In May 1897 he secured the adoption of the Army Reform Bill, fixing Italian military expenditure at a maximum of £9,560,000 a year, but in December of that year he was defeated in the Chamber on the question of the promotion of officers. Resigning office, he was in May 1898 sent as royal commissioner to Bari, where, without recourse to martial law, he succeeded in restoring public order. Upon the fall of Rudini in June 1898, General Pelloux was entrusted by King Humbert with the formation of a cabinet, and took for himself the post of minister of the interior. He resigned office in May 1899, but was again entrusted with the formation of the ministry. He took stern measures against the revolutionary elements in southern Italy, and his new cabinet was essentially military and conservative. The Public Safety Bill for the reform of the police laws, taken over by him from the Rudini cabinet, and eventually promulgated by royal decree, was fiercely obstructed by the Socialist party, which, with the Left and Extreme Left, succeeded in forcing General Pelloux to dissolve the Chamber in May 1900, and to resign office after the general election in June. In the autumn of 1901 he was appointed to the command of the Turin army corps.

PELOMYXA, so named by R. Greeff, a genus of Lobose Rhizopoda (*q.v.*), naked, multinucleate, with very blunt rounded pseudopodia, formed by eruption (see AMOEBA), often containing peculiar vesicles (glycogen ?), and full of a symbiotic bacterium. It inhabits the ooze of decomposing organic matter at the bottom of ponds and lakes.

PELOPIDAS (d. 364 B.C.), Theban statesman and general. He was a member of a distinguished family, and possessed great wealth which he expended on his friends, while content to lead the life of an athlete. In 385 B.C. he served in a Theban contingent sent to the support of the Spartans at Mantineia, where he was saved, when dangerously wounded, by Epaminondas (*q.v.*). Upon the seizure of the Theban citadel by the Spartans (383 or 382) he fled to Athens, and took the lead in a conspiracy to liberate Thebes. In 379 his party surprised and killed their chief political opponents, and roused the people against the Spartan garrison, which surrendered to an army gathered by Pelopidas. In this and subsequent years he was elected *boeotarch*, and about 375 he routed a much larger Spartan force at Tegyra (near Orchomenus). This victory he owed mainly to the valour of the Sacred Band, a picked body of 300 infantry. At the battle of Leuctra (371) he contributed greatly to the success of Epaminondas's new tactics by the rapidity with which he made the Sacred Band close with the Spartans. In 370 he accompanied his friend Epaminondas as *boeotarch* into Peloponnesus. On their return both generals were unsuccessfully accused of having retained their command beyond the legal term. In 369, in response to a petition of the Thessalians, Pelopidas was sent with an army against Alexander, tyrant of Pherae. After driving Alexander out, he passed into Macedonia and arbitrated between two claimants to the throne. In order to secure the influence of Thebes, he brought home hostages, including the king's brother, afterwards Philip II., the conqueror of Greece. Next year Pelopidas was again called upon to interfere in Macedonia, but, being deserted by his mercenaries, was compelled to make an agreement with Ptolemaeus of Alorus. On his return through Thessaly he was seized by Alexander of Pherae, and two expeditions from Thebes were needed to secure his release. In 367 Pelopidas went on an embassy to the Persian king and induced him to prescribe a settlement of Greece according to the wishes of the Thebans. In 364 he received another appeal from the Thessalian towns against Alexander of Pherae. Though an eclipse of the sun prevented his bringing with him more than a handful of troops, he overthrew the tyrant's far superior force on the ridge of Cynoscephalae; but wishing to slay Alexander with his own hand, he rushed forward too eagerly and was cut down by the tyrant's guards.

Plutarch and Nepos, *Pelopidas*; Diodorus xv. 62-81; Xenophon, *Hellenica*, vii. 1. See also THEBES. (M. O. B. C.)

PELOPONNESIAN WAR, in Greek history, the name given specially to the struggle between Athens at the head of the Delian League and the confederacy of which Sparta was the leading power.[1] According to Thucydides the war, which was

[1] Some historians prefer to call it the Second Peloponnesian War, the first being that of 457, which ended with the Thirty Years' Peace.

in his view the greatest that had ever occurred in Greece, lasted from 431 to the downfall of Athens in 404. The genius of Thucydides has given to the struggle the importance of an epoch in world-history, but his view is open to two main criticisms—(1) that the war was in its ultimate bearings little more than a local disturbance, viewed from the standpoint of universal history; (2) that it cannot be called a war in the strict sense. The former of these criticisms is justified in the article on GREECE: *History* (*q.v.*). Unless we are to believe that the Macedonian supremacy is directly traceable to the mutual weakening of the Greek cities, in 431–403, it is difficult to see what lasting importance attaches to the war. As regards the second, a few chief difficulties may be indicated. The very narrative even of Thucydides himself shows that the "war" was not a connected whole. It may be divided into three main periods—(1) from 431 to 421 (Lysias calls it the "Archidamian" War), when the Peace of Nicias, not merely formally, but actually produced a cessation of hostilities; (2) from 421 till the intervention of Sparta in the Sicilian War; during these years there was no "Peloponnesian War," and there were several years in which there was in reality no fighting at all: the Sicilian expedition was in fact a side issue; (3) from 413 to 404, when fighting was carried on mainly in the Aegean Sea (Isocrates calls this the "Decelean" War). The disjointed character of the struggle is so obvious from Thucydides himself that historians have come to the conclusion that the idea of treating the whole struggle as a single unit was *ex post facto* (see GREECE: *History*, § A, "Ancient," *ad fin.*).

The book itself affords evidence which goes far to justify this view. A very important problem is presented by bk. v., which is obviously put in as a connecting link to prove a theory. Thucydides expressly warns us not to regard the period of this book as one of peace, and yet the very contents of the book refute his argument. In 419 and 417 there is practically no fighting: the Mantinean War of 418 is a disconnected episode which did not lead to a resumption of hostilities: in 420 there are only obscure battles in Thrace: in 416 there is only the expedition to Melos; and finally from 421 to 413 there is official peace. Other details may be cited in corroboration. Book v. (ch. 26) contains a second introduction to the subject; *ὅδε ὁ πόλεμος* in i. 23 and iv. 48 is the Archidamian or Ten Years' War; in v. 26 we read of a *πρῶτος πόλεμος*, a *ὕστερος πόλεμος* and an *ἀνακωχή*. Some critics think on these and other grounds that Thucydides wrote and published bks. i.–v. 25 by itself, then bks. vi. and vii. (Sicilian expedition), and finally revising his view joined them into one whole by the somewhat unsatisfactory bk. v. 26 and following chapters, and began to round off the story with the incomplete bk. viii. (on this see GREECE: *History*, as above). It is perhaps most probable that he retained notes made contemporarily and worked them up some time after 404, in a few passages failing to correct inconsistencies and dying before bk. viii. was completed. The general introduction in bk. i. was unquestionably written shortly after 404.

The causes of the war thus understood are complex. The view taken by Thucydides that Sparta was the real foe of Athens has been much modified by modern writers. The key to the situation is in fact the commercial rivalry of the Corinthians, whose trade (mainly in the West) had been seriously limited by the naval expansion of the Delian League. This rivalry was roused to fever heat by the Athenian intervention in 434–33 on behalf of Corcyra, Corinth's rebellious colony (see CORFU) and from that time the Corinthians felt that the Thirty Years' Truce was at an end. An opportunity soon offered for making a counter attack. Potidaea, a Dorian town on the western promontory of Chalcidice in Thrace, a tributary ally of Athens—to which however Corinth as metropolis still sent annual magistrates—was induced to revolt,[1] with the support of the Macedonian king Perdiccas, formerly an Athenian ally. The Athenian Phormio succeeded in blockading the city so that its capture was merely a question of time, and this provided the Corinthians with an urgent reason for declaring war.

Prior to these episodes Athens had not been in hostile contact with any of the Peloponnesian confederate states for more than ten years, and Pericles had abandoned a great part of his imperial policy. He now laid an embargo upon Megara by which the Megarians were forbidden on pain of death to pursue trading operations with any part of the Athenian Empire. The circumstances of this decree (or decrees) are not material to the present argument (see Grote, *History of Greece*, ed. 1907, p. 370 note) except that it turned special attention to the commercial supremacy which Athens claimed to enjoy. In 432 a conference of Peloponnesian allies was summoned and the Corinthian envoys urged the Spartans to declare war on the ground that the power of Athens was becoming so great as to constitute a danger to the other states. This might have been urged with justice before the Thirty Years' Truce (447); but by that truce Athens gave up all her conquests in Greece proper except Naupactus and Plataea, while her solitary gains in Amphipolis and Thurii were compensated by other losses. The fact that the Corinthian argument failed to impress Sparta and many of the delegates is shown by the course of the debate. What finally impelled the Spartans to agree to the war was the veiled threat by the Corinthians that they would be driven into another alliance (*i.e.* Argos, i. 71). We can hardly regard Sparta as the determined enemy of Athens at this time. Only twice since 461 had she been at war with Athens—in 457 (Tanagra) and 447, when she deliberately abstained from pushing the advantage which the revolt in Euboea provided; she had refused to help the oligarchs of Samos in 440. Corinth however had not only strong, but also immediate and urgent reasons (Potidaea and Corcyra) for desiring war. It has been argued that the war was ultimately a struggle between the principles of oligarchy and democracy. This view, however, cannot be taken of the early stages of the war when there was democracy and oligarchy on both sides (see *ad fin.*); it is only in the later stages that the political difference is prominent.

The Opposing Forces.—The permanent strength of the Peloponnesian confederacy lay in the Peloponnesian states, all of which except Argos and Achaea were united under Sparta's leadership. But it included also extra-Peloponnesian states—viz. Megara, Phocis, Boeotia and Locris (which had formed part of the Athenian land empire), and the maritime colonies round the Ambracian Gulf. The organization was not elaborate. The federal assembly with few exceptions met only in time of war, and then only when Sparta agreed to summon it. It met in Sparta and the delegates, having stated their views before the Spartan Apella, withdrew till the Apella had come to a decision. The delegates were then invited to return and to confirm that decision. It is clear that the link was purely one of common interest, and that Sparta had little or no control over, *e.g.* so powerful a confederate as Corinth. Sparta was the chief member of the confederacy (*hegemon*), but the states were autonomous. In time of war each had to provide two-thirds of its forces, and that state in whose territory the war was to take place had to equip its whole force.

The Athenian Empire is described elsewhere (DELIAN LEAGUE, ATHENS). Here it must suffice to point out that there was among the real and technical allies no true bond of interest, and that many of the states were in fact bound by close ties to members of the Peloponnesian confederacy (*e.g.* Potidaea to Corinth). Sparta could not only rely on voluntary co-operation but could undermine Athenian influence by posing as the champion of autonomy. Further, Thucydides is wrong on his own showing in saying that Sparta refused to tolerate democratic government in confederate cities; it was not till after 418 that this policy was adopted. Athens, on the other hand, had undoubtedly interfered in the interest of democracy in various allied states (see DELIAN LEAGUE).

No detailed examination of the comparative military and naval resources of the combatants can here be attempted. On land the Peloponnesians were superior: they had at least 30,000

[1] The importance of this revolt lay in the fact that it immediately involved danger to Athens throughout the Chalcidic promontories, and her north-east possessions generally.

hoplites not including 10,000 from Central Greece and Boeotia: these soldiers were highly trained. The Athenian army was undoubtedly smaller. There has been considerable discussion as to the exact figures, the evidence in Thucydides being highly confusing, but it is most probable that the available fighting force was not more than half that of the Peloponnesian confederacy. Even of these we learn (Thuc. iii. 87) that 4400 died in the great plague. The only light-armed force was that of Boeotia at Delium (10,000 with 500 peltasts). Of cavalry Athens had 1000, Boeotia a similar number. The only other cavalry force was that of Thessaly, which, had it been loyal to Athens, would have meant a distinct superiority. In naval power the Athenians undoubtedly had an overwhelming advantage at the beginning, both in numbers and in training.

Financially Athens had an enormous apparent advantage. She began with a revenue of 1000 talents (including 600 from σύμμαχοι), and had also, in spite of the heavy expense which the building schemes of Pericles had involved, a reserve of 6000 talents. The Peloponnesians had no reserve and no fixed revenue assessment. On the other hand the Peloponnesian armies were unpaid, while Athens had to spend considerable sums on the payment of crews and mercenaries. In the last stages of the war the issue was determined by the poverty of Athens and Persian gold.

The events of the struggle from 431 to 404 may be summarized in the three periods distinguished above.

1. *The Ten Years' or Archidamian War.*—The Spartans sent to Athens no formal declaration of war but rather sought first to create some specious *casus belli* by sending requisitions to Athens. The first, intended to inflame the existing hostilities against Pericles (*q.v.*) in Athens, was that he should be expelled the city as being an Alcmaeonid (grand-nephew of Cleisthenes) and so implicated in the curse pronounced on the murderers of Cylon nearly 200 years before. This outrageous demand was followed by three others—that the Athenians should (1) withdraw from Potidaea, (2) restore autonomy to Aegina, and (3) withdraw the embargo on Megarian commerce. Upon the refusal of all these demands Sparta finally made the maintenance of peace contingent upon the restoration by Athens of autonomy to all her allies. Under the guidance of Pericles Athens replied that she would do nothing on compulsion, but was prepared to submit difficulties to amicable arbitration on the basis of mutual concessions. Before anything could come of this proposal, matters were precipitated (end of March 431) by the attack of Thebes upon Plataea (*q.v.*), which immediately sought and obtained the aid of Athens. War was begun. The Spartan king Archidamus assembled his army, sent a herald to announce his approach, marched into Attica and besieged Oenoe.

Meanwhile Pericles had decided to act on the defensive, *i.e.* to abandon Attica, collect all its residents in Athens and treat Athens as an island, retaining meanwhile command of the sea and making descents on Peloponnesian shores. The policy, which Thucydides and Grote commend, had grave defects—though it is by no means easy to suggest a better; *e.g.* it meant the ruin of the landed class, it tended to spoil the *moral* of those who from the walls of Athens annually watched the wasting of their homesteads, and it involved the many perils of an overcrowded city—a peril increased by, if not also the cause of, the plague. Moreover sea power was not everything, and delay exhausted the financial reserves of the state, while financial considerations, as we have seen, were comparatively unimportant to the Peloponnesians. The descents on the Peloponnese were futile in the extreme.

Archidamus, having wasted much territory, including Acharnae, retired at the end of July. The Athenians retaliated by attacking Methone (which was secured by Brasidas), by successes in the West, by expelling all Aeginetans from Aegina (which was made a cleruchy), and by wasting the Megarid.

In 430 Archidamus again invaded Attica, systematically wasting the country. Shortly after he entered Attica plague broke out in Athens, borne thither by traders from Carthage or Egypt (Holm, *Greek History*, ii. 346 note). The effect upon the overcrowded population of the city was terrible. Of the 1200 cavalry (including mounted archers) 300 died, together with 4400 hoplites: altogether the estimate of Diodorus (xii. 58) that more than 10,000 citizens and slaves succumbed is by no means excessive. None the less Pericles sailed with 100 triremes, and ravaged the territory near Epidaurus. Subsequently he returned and the expedition proceeded to Potidaea. But the plague went with them and no results were achieved. The enemies of Pericles, who even with the aid of Spartan intrigue had hitherto failed to harm his prestige, now succeeded in inducing the desperate citizens to fine him for alleged malversation. The verdict, however, shocked public feeling and Pericles was reinstated in popular favour as strategus (*c.* Aug. 430). About a year later he died. In the autumn of 430 a Spartan attack on Zacynthus failed and the Ambraciots were repulsed from Amphilochian Argos. In reply Athens sent Phormio to Naupactus to watch her interests in that quarter. In the winter Potidaea capitulated, receiving extremely favourable terms.

In 429 the Peloponnesians were deterred by the plague from invading Attica and laid siege to Plataea in the interests of Thebes. The Athenians failed in an expedition to Chalcidice under Xenophon, while the Spartan Cnemus with Chaonian and Epirot allies was repulsed from Stratus, capital of Acarnania, and Phormio with only 20 ships defeated the Corinthian fleet of 47 sail in the Gulf of Corinth. Orders were at once sent from Sparta to repair this disaster and 77 ships were equipped. Help sent from Athens was diverted to Crete, and after much manœuvring Phormio was compelled to fight off Naupactus. Nine of his ships were driven ashore, but with the other 11 he subsequently defeated the enemy and recovered the lost nine. With the reinforcement which arrived afterwards he established complete control of the western seas. A scheme for operating with Sitalces against the Chalcidians of Thrace fell through, and Sitalces joined Perdiccas.

The year 428 was marked by a third invasion of Attica and by the revolt of Lesbos from Athens. After delay in fruitless negotiations the Athenian Cleippides, and afterwards Paches, besieged Mytilene, which appealed to Sparta. The Peloponnesian confederacy resolved to aid the rebels both directly and by a counter demonstration against Athens. The Athenians, though their reserve of 6000 talents was by now almost exhausted (except for 1000 talents in a special reserve), made a tremendous effort (raising 200 talents by a special property tax), and not only prevented an invasion by a demonstration of 100 triremes at the Isthmus, but sent Asopius, son of Phormio, to take his place in the western seas. In spring 427 the Spartans again invaded Attica without result. The winter of 428–427 was marked by the daring escape of half the Plataean garrison under cover of a stormy night, and by the capitulation of Mytilene, which was forced upon the oligarchic rulers by the democracy. The Spartan fleet arrived too late and departed without attempting to recover the town. Paches cleared the Asiatic seas of the enemy, reduced the other towns of Mytilene and returned to Athens with upwards of 1000 prisoners. An assembly was held and under the invective of Cleon (*q.v.*) it was decided to kill all male Mytileneans of military age and to sell the women and children as slaves. This decree, though in accordance with the rigorous customs of ancient warfare as exemplified by the treatment which Sparta shortly afterwards meted out to the Plataeans, shocked the feelings of Athens, and on the next day it was (illegally) rescinded just in time to prevent Paches carrying it out. The thousand [1] oligarchic prisoners were however executed, and Lesbos was made a cleruchy.

Meanwhile there occurred civil war in Corcyra, in which ultimately, with the aid of the Athenian admiral Eurymedon, the democracy triumphed amid scenes of the wildest savagery. In the autumn of the year Nicias fortified Minoa at the mouth of the harbour of Megara. Shortly afterwards the Spartans

[1] So Thuc. iii. 50. It is suggested that this number is an error for 30 or 50 (*i.e.*, Λ or Ν for Α). It seems incredible that 1000 could be described as "ringleaders" out of a population of perhaps 5000.

planted an unsuccessful colony at Heraclea in the Trachinian territory north-west of Thermopylae.

In the summer of 426 Nicias led a predatory expedition along the north-west coast without achieving any positive victory. More important, though equally ineffective, was the scheme of Demosthenes to march from Naupactus through Aetolia, subduing the wild hill tribes, to Cytinium in Doris (in the upper valleys of the Cephissus) and thence into Boeotia, which was to be attacked simultaneously from Attica. The scheme was crushed by the courage and skill of the Aetolians, who thereupon summoned Spartan and Corinthian aid for a counter attack on Naupactus. Demosthenes averted this, and immediately afterwards by superior tactics inflicted a complete defeat at Olpae in Acarnania on Eurylochus at the head of a Spartan and Ambracian force. An Ambracian reinforcement was annihilated at one of the peaks called Idomene, and a disgraceful truce was accepted by the surviving Spartan leader Menedaeus. This was not only the worst disaster which befell any powerful state up to the peace of Nicias (as Thucydides says), but was a serious blow to Corinth, whose trade on the West was, as we have seen, one of the chief causes of the war.

The year 425 is remarkable for the Spartan disaster at Pylos (*q.v.*). The Athenians had despatched 40 triremes under Eurymedon and Procles to Sicily with orders to call first at Corcyra to prevent an expected Spartan attack. Meantime Demosthenes had formed the plan of planting the Messenians of Naupactus in Messenia—now Spartan territory—and obtained permission to accompany the expedition. The fleet was, as it chanced, delayed by a storm in the Bay of Navarino, and rough fortifications were put up by the sailors on the promontory of Pylos. Demosthenes was left behind in this fort, and the Spartans promptly withdrew from their annual raid upon Attica and their projected attack on Corcyra to dislodge him. After a naval engagement (see Pylos) a body of Spartan hoplites were cut off on Sphacteria. So acutely did Sparta feel their position that an offer of peace was made on condition that the hoplites should go free. The eloquence of Cleon frustrated the peace party's desire to accept these terms, and ultimately to the astonishment of the Greek world the Spartan hoplites to the number of 292 surrendered unconditionally (see Cleon).

Thus in 424 the Athenians had seriously damaged the prestige of Sparta, and broken Corinthian supremacy in the north-west, and the Peloponnesians had no fleet. This was the zenith of their success, and it was unfortunate for them that they declined the various offers of peace which Sparta made. The next two years changed the whole position. The doubling of the tribute in 425 pressed hardly on the allies (see Delian League): Nicias failed in a plot with the democratic party in Megara to seize that town; and the brilliant campaigns of Brasidas (*q.v.*) in the north-east, culminating in the capture of Amphipolis (422), finally destroyed the Athenian hopes of recovering their land empire, and entirely restored the balance of success and Spartan prestige. Moreover, the admirably conceived scheme for a simultaneous triple attack upon Boeotia at Chaeronea in the north, Delium in the south-east, and Siphae in the south-west had fallen through owing to the inefficiency of the generals. The scheme, which probably originated with the atticizing party in Thebes, resulted in the severe defeat of Hippocrates at Delium by the Boeotians under Pagondas, and was a final blow to the policy of an Athenian land empire.

These disasters at Megara, Amphipolis and Delium left Athens with only one trump card—the possession of the Spartan hoplites captured in Sphacteria. This solitary success had already in the spring of 423 induced Sparta in spite of the successes which Brasidas was achieving in Thrace to accept the "truce of Laches"—which, however, was rendered abortive by the refusal of Brasidas to surrender Scione. The final success of Brasidas at Amphipolis, where both he and Cleon were killed, paved the way for a more permanent agreement, the peace parties at Athens and Sparta being in the ascendant.

2. *From* 421 *to* 413.—Peace was signed in March 421 on the basis of each side's surrendering what had been acquired by the war, not including those cities which had been acquired by capitulation. It was to last for fifty years. Its weak points, however, were numerous. Whereas Sparta had been least of all the allies interested in the war, and apart from the campaigns of Brasidas had on the whole taken little part in it, her allies benefited least by the terms of the Peace. Corinth did not regain Sollium and Anactorium, while Megara and Thebes respectively were indignant that Athens should retain Nisaea and receive Panactum. These and other reasons rapidly led to the isolation of Sparta, and there was a general refusal to carry out the terms of agreement. The history of the next three years is therefore one of complex inter-state intrigues combined with internal political convulsions. In 421 Sparta and Athens concluded a defensive alliance; the Sphacterian captives were released and Athens promised to abandon Pylos. Such a peace, giving Sparta everything and Athens nothing but Sparta's bare alliance, was due to the fact that Nicias and Alcibiades were both seeking Sparta's friendship. At this time the Fifty Years' Truce between Sparta and Argos was expiring. The Peloponnesian malcontents turned to Argos as a new leader, and an alliance was formed between Argos, Corinth, Elis, Mantinea and the Thraceward towns (420). This coalition between two different elements—an anti-oligarchic party and a war party—had no chance of permanent existence. The war party in Sparta regained its strength under new ephors and negotiations began for an alliance between Sparta, Argos and Boeotia. The details cannot here be discussed. The result was a re-shuffling of the cards. The democratic states of the Peloponnese were driven, partly by the intrigues of Alcibiades, now anti-Laconian, into alliance with Athens, with the object of establishing a democratic Peloponnese under the leadership of Argos. These unstable combinations were soon after upset by Alcibiades himself, who, having succeeded in displacing Nicias as strategus in 419, allowed Athenian troops to help in attacking Epidaurus. For a cause not easy to determine Alcibiades was defeated by Nicias in the election to the post of strategus in the next year, and the suspicions of the Peloponnesian coalition were roused by the inadequate assistance sent by Athens, which arrived too late to assist Argos when the Spartan king Agis marched against it. Ultimately the Spartans were successful over the coalition at Mantinea, and soon afterwards an oligarchic revolution at Argos led to an alliance between that city and Sparta (*c.* Feb. 417). This oligarchy was overthrown again in June, and the new democracy having vainly sought an agreement with Sparta rejoined Athens. It was thus left to Athens to expend men and money on protecting a democracy by the aid of which she had hoped practically to control the Peloponnesus. All this time, however, the alliance between her and Sparta was not officially broken.

The unsatisfactory character of the Athenian Peloponnesian coalition was one of the negative causes which led up to the Sicilian Expedition of 415. Another negative cause may be found in the failure of an attempt or attempts to subdue the Thraceward towns. By combining the evidence of Plutarch (in his comparison of Nicias and Crassus), Thuc. v. 83, and the inscription which gives the treasury payments for 418–415 (Hicks and Hill, *Gr. Hist. Inscr.* 70), we can scarcely doubt that there were expeditions in 418 (Euthydemus) and the summer of 417 (Nicias), and that in the winter of 417 a blockading squadron under Chaeremon was despatched. This policy—which was presumably that of Nicias in opposition to Alcibiades—having failed, the way was cleared for a reassertion of that policy of western conquest which had always had advocates from Themistocles onward in Athens,[1] and was part of the democratic programme.

The tragic fiasco of the Sicilian expedition, involving the death

[1] In 454 Athens made a treaty with Segesta (inscr. Hicks and Hill, *Greek Hist. Inscr.* 34): in 433 with Rhegium and Leontini (Hicks and Hill, 51 and 52; cf. Thuc. iii. 86, παλαιὰ συμμαχία with Chalcidic towns in Sicily): in 444 the colony of Thurii was founded: in 427 (see above) 60 ships were sent to Sicily; and if we may believe Aristophanes (*Eq.* 1302) Hyperbolus asked for 100 triremes for Carthage.

of Nicias and the loss of thousands of men and hundreds of ships, was a blow from which Athens never recovered (see under SYRACUSE and SICILY). Even before the final catastrophe the Spartans had reopened hostilities. On the advice of Alcibiades (*q.v.*), exiled from Athens in 415, they had fortified Decelea in Attica within fifteen miles of Athens. This place not only served as a permanent headquarters for predatory expeditions, but cut off the revenue from the Laurium mines, furnished a ready asylum for runaway slaves, and rendered the transference of supplies from Euboea considerably more difficult (*i.e.* by the sea round Cape Sunium). Athens thus entered upon the third stage of the conflict with exceedingly poor prospects.

3. *The Ionian or Decelean War.*—From the Athenian standpoint this war may be broken up into three periods: (1) period of revolt of allies (413–411), (2) the rally (410–408), (3) the relapse (407–404). As contrasted with the Archidamian War, this war was fought almost exclusively in the Aegean Sea, the enemy was primarily Sparta, and the deciding factor was Persian gold. Furthermore, apart from the gradual disintegration of the empire, Athens was disturbed by political strife.

In 412 many Ionian towns revolted, and appealed either to Agis at Decelea or to Sparta direct. Euboea, Lesbos, Chios, Erythrae led the way in negotiation and revolt, and simultaneously the court of Susa instructed the satraps Pharnabazus and Tissaphernes to renew the collection of tribute from the Greek cities of Asia Minor. The satraps likewise made overtures to Sparta. The revolt of the Ionian allies was due in part to Alcibiades also, whose prompt action in co-operation with his friend the ephor Endius finally confirmed the Chian oligarchs in their purpose. In 411 a treaty was signed by Sparta and Tissaphernes against Athens: the treaty formally surrendered to the Persian king all territory which he or his predecessors had held. It was subsequently renewed in a form somewhat less disgraceful to Greek patriotism by the Spartans Astyochus and Theramenes. On the other hand, a democratic rising in Samos prevented the rebellion of that island, which for the remainder of the war was invaluable to Athens as a stronghold lying between the two great centres of the struggle.

After the news of the Sicilian disaster Athens was compelled at last to draw on the reserve of 1000 talents which had lain untouched in the treasury.[1] The revolt of the Ionian allies, and (in 411) the loss of the Hellespontine, Thracian and Island tributes (see DELIAN LEAGUE), very seriously crippled her finances. On the other hand, Tissaphernes undertook to pay the Peloponnesian sailors a daily wage of one Attic drachma (afterwards reduced to ½ drachma). In Attica itself Athens lost Oenoe and Oropus, and by the end of 411 only one quarter of the empire remained. In the meanwhile Tissaphernes began to play a double game with the object of wasting the strength of the combatants. Moreover Alcibiades lost the confidence of the Spartans and passed over to Tissaphernes, at whose disposal he placed his great powers of diplomacy, at the same time scheming for his restoration to Athens. He opened negotiations with the Athenian leaders in Samos and urged them to upset the democracy and establish a philo-Persian oligarchy. After elaborate intrigues, in the course of which Alcibiades played false to the conspirators by forcing them to abandon the idea of friendship with Tissaphernes owing to the exorbitant terms proposed, the new government by the Four Hundred was set up in Athens (see THERAMENES). This government (which received no support from the armament in Samos) had a brief life, and on the final revolt of Euboea was replaced by the old democratic system. Alcibiades (*q.v.*) was soon afterwards invited to return to Athens.

The war, which, probably because of financial trouble, the Spartans had neglected to pursue when Athens was thus in the throes of political convulsion, was now resumed. After much manœuvring and intrigues a naval battle was fought at Cynossema in the Hellespont in which victory on the whole rested with the Athenians (Aug. 411), though the net result was inconsiderable. About this time the duplicity of Tissaphernes—who having again and again promised a Phoenician fleet and having actually brought it to the Aegean finally dismissed it on the excuse of trouble in the Levant—and the vigorous honesty of Pharnabazus definitely transferred the Peloponnesian forces to the north-west coast of Asia Minor and the Hellespont. There they were regularly financed by Pharnabazus, while the Athenians were compelled to rely on forced levies. In spite of this handicap Alcibiades, who had been seized and imprisoned by Tissaphernes at Sardis but effected his escape, achieved a remarkable victory over the Spartan Mindarus at Cyzicus (about April 410). So complete was the destruction of the Peloponnesian fleet that, according to Diodorus, peace was offered by Sparta (see *ad fin.*) and would have been accepted but for the warlike speeches of the "demagogue" Cleophon representing the extreme democrats.[2] Another result was the return to allegiance (409) of a number of the north-east cities of the empire. Great attempts were made by the Athenians to hold the Hellespont and then to protect the corn-supply from the Black Sea. In Greece these gains were compensated hy the loss of Pylos and Nisaea.

In 408 Alcibiades effectively invested Chalcedon, which surrendered by agreement with Pharnabazus, and subsequently Byzantium also fell into his hands with the aid of some of its inhabitants.

Pharnabazus, weary of bearing the whole cost of the war for the Peloponnesians, agreed to a period of truce so that envoys might visit Susa, but at this stage the whole position was changed by the appointment of Cyrus the Younger as satrap of Lydia, Greater Phrygia and Cappadocia. His arrival coincided with the appointment of Lysander (*c.* Dec. 408) as Spartan admiral—the third of the three great commanders (Brasidas and Gylippus being the others) whom Sparta produced during the war. Cyrus promptly agreed on the special request of Lysander (*q.v.*) to pay slightly increased wages to the sailors, while Lysander established a system of anti-Athenian clubs and oligarchic governments in various cities. Meanwhile Alcibiades (May 407), having exacted levies in Caria, returned at length to Athens and was elected strategus with full powers (see STRATEGUS). He raised a large force of men and ships and endeavoured to draw Lysander (then at Ephesus) into an engagement. But Cyrus and Lysander were resolved not to fight till they had a clear advantage, and Alcibiades took a small squadron to Phocaea. In spite of his express orders his captain Antiochus in his absence provoked a battle and was defeated and killed at Notium. This failure and the refusal of Lysander to fight again destroyed the confidence which Alcibiades had so recently regained. Ten strategi were appointed to supersede him and he retired to fortified ports in the Chersonese which he had prepared for such an emergency (*c.* Jan. 406). At the same time Lysander's year of office expired and he was superseded by Callicratidas, to the disgust of all those whom he had so carefully organized in his service. Callicratidas, an honourable man of pan-Hellenic patriotism, was heavily handicapped in the fact that Cyrus declined to afford him the help which had made Lysander powerful, and had recourse to the Milesians and Chians, with whose aid he fitted out a fleet of 140 triremes (only 10 Spartan). With these he pursued Conon (chief of the ten new Athenian strategi), captured 30 of his 70 ships and besieged him in Mytilene. Faced with inevitable destruction, Conon succeeded in sending the news to Athens, where by extraordinary efforts a fleet of 110 ships was at once equipped. Callicratidas, hearing of this fleet's approach, withdrew from Mytilene, leaving Eteonicus in charge of the blockade. Forty more ships were collected by the Athenians, who met and defeated Callicratidas at Arginusae with a loss of more than half his fleet. The immediate result was that Eteonicus left Mytilene and Conon found himself free. Unfortunately the victorious generals at Arginusae, through negligence or owing

[1] She had already abolished the system of tribute in favour of a 5% *ad valorem* tax on all imports and exports carried by sea between her ports and those of the allies.

[2] Xenophon, *Hell.* does not mention it: Thucydides's history had by this time come to an end.

to a storm, failed to recover the bodies of those of their crews who were drowned or killed in the action. They were therefore recalled, tried and condemned to death, except two who had disobeyed the order to return to Athens.

At this point Lysander was again sent out, nominally as secretary to the official admiral Aracus. Cyrus, recalled to Susa by the illness of Darius, left him in entire control of his satrapy. Thus strengthened he sailed to Lampsacus on the Hellespont and laid siege to it. Conon, now in charge of the Athenian fleet, sailed against him, but the fleet was entirely destroyed while at anchor at Aegospotami (Sept. 405), Conon escaping with only 12 out of 180 sail to Cyprus. In April 404 Lysander sailed into the Peiraeus, took possession of Athens, and destroyed the Long Walls and the fortifications of Peiraeus. An oligarchical government was set up (see CRITIAS), and Lysander having compelled the capitulation of Samos, the last Athenian stronghold, sailed in triumph to Sparta.

Two questions of considerable importance for the full understanding of the Peloponnesian War may be selected for special notice: (1) how far was it a war between two antagonistic theories of government, oligarchic and democratic? and (2) how far was Athenian statesmanship at fault in declining the offers of peace which Sparta made?

1. A common theory is that Sparta fought throughout the war as an advocate of oligarchy, while Athens did not seek to interfere with the constitutional preferences of her allies. The view is based partly on Thuc. i. 19, according to which the Spartans took care that their allies should adhere to a policy convenient to themselves. This idea is disproved by Thucydides' own narrative, which shows that down to 418 (the battle of Mantinea) Sparta tolerated democratic governments in Peloponnesus itself—*e.g.* Elis, Mantinea, Sicyon, Achaea. It was only after that date that democracy was suppressed in the Peloponnesian League, and even then Mantinea remained democratic. In point of fact, it was only when Lysander became the representative of Spartan foreign policy—*i.e.* in the last years of the war—that Sparta was identified with the oligarchic policy. On the other hand, there is strong evidence that the Athenian Empire at a much earlier date was based upon a uniform democratic type of government (cf. Thuc. i. 19, viii. 64; Xen. *Pol.* i. 14, *Hell.* iii. 47; Arist. *Pol.* viii. 69). It is true that we find oligarchic government in Chios and Lesbos (up to 428) and in Samos (up to 440), but this is discounted by the fact that all three were "autonomous" allies. Moreover, in the case of Samos there was a democracy in 439, though in 412 the government was again oligarchic. The case of Selymbria (see Hicks and Hill, *op. cit.* 77) is of little account, because at that time (409) the Empire was *in extremis*. In general we find that Athenian orators take special credit on the ground that the Athenian had given to her allies the constitutional advantages which they themselves enjoyed.

2. In view of the disastrous issue of the war, it is important to notice that on three occasions—(*a*) after Pylos, (*b*) after Cyzicus, (*c*) after Arginusae—Athens refused formal peace proposals from Sparta. (*a*) Though Cleon was probably wise in opposing peace negotiations before the capture of the Spartans in Sphacteria, it seems in the light of subsequent events that he was wrong to refuse the terms which were offered after the hoplites had been captured. No doubt, however, the temper in Athens was at that time predominantly warlike, and the surrender of the hoplites was a unique triumph. Possibly, too, Cleon foresaw that peace would have meant a triumph for the philo-Laconian party. (*b*) The peace proposals of 410 are given by Diodorus, who says that the ephor Endius proposed that a peace should be made on the basis of *uti possidetis*, except that Athens should evacuate Pylos and Cythera, and Sparta, Decelea. Cleophon, however, perhaps doubting whether the offer was sincere (cf. Philochorus in Schol. *ap.* Eurip. *Orest.* 371; *Fragm.* ed. Didot, 117, 118), demanded the *status quo ante* (413 or 431). (*c*) The proposals of 406, mentioned by *Ath. Pol.* 34, were on the same lines, except that Athens no longer had Pylos and Cythera, and had lost practically half her empire. At this time peace must therefore have been advantageous to Athens as showing the world that in spite of her losses she was still one of the great powers of Greece. Moreover, an alliance with Sparta would have meant a check to Persian interference. It is probable, again, that party interest was a leading motive in Cleophon's mind, since a peace would have meant the return of the oligarchic exiles and the establishment of a moderate oligarchy.

AUTHORITIES.—G. Busolt, *Griech. Geschichte*, Bd. III., Teil ii. (1904), "Der Peloponnesische Krieg" is essential. All histories of Greece may be consulted. (See GREECE: *History, Ancient*, § "Authorities.") (J. M. M.)

PELOPONNESUS ("Island of Pelops"), the ancient and modern Greek official name for the part of Greece south of the Isthmus of Corinth. In medieval times it was called the Morea, from its resemblance to a mulberry-leaf in shape, and this name is still current in popular speech.

PELOPS, in Greek legend, the grandson of Zeus, son of Tantalus and Dione, and brother of Niobe. His father's home was on Mt Sipylus in Asia Minor, whence Pelops is spoken of as a Lydian or a Phrygian. Tantalus one day served up to the gods his own son Pelops, boiled and cut in pieces. The gods detected the crime, and none of them would touch the food except Demeter (according to others, Thetis), who, distracted by the loss of her daughter Persephone, ate of the shoulder. The gods restored Pelops to life, and the shoulder consumed by Demeter was replaced by one of ivory. Wherefore the descendants of Pelops had a white mark on their shoulder ever after (Ovid, *Metam.* vi. 404; Virgil, *Georgics*, iii. 7). This tale is perhaps reminiscent of human sacrifice amongst the Greeks. Poseidon carried Pelops off to Olympus, where he dwelt with the gods, till, for his father's sins, he was cast out from heaven. Then, taking much wealth with him, he crossed over from Asia to Greece. He went to Pisa in Elis as suitor of Hippodameia, daughter of king Oenomaus, who had already vanquished in the chariot-race and slain many suitors for his daughter's hand. But by the help of Poseidon, who lent him winged steeds, or of Oenomaus's charioteer Myrtilus, whom he or Hippodameia bribed, Pelops was victorious in the race, wedded Hippodameia, and became king of Pisa (Hyginus, *Fab.* 84). The race of Pelops for his wife may be a reminiscence of the early practice of marriage by capture. When Myrtilus claimed his promised reward, Pelops flung him into the sea near Geraestus in Euboea, and from his dying curse sprang those crimes and sorrows of the house of Pelops which supplied the Greek tragedians with such fruitful themes (Sophocles, *Electra*, 505, with Jebb's note). Among the sons of Pelops by Hippodameia were Atreus, Thyestes and Chrysippus. From Pisa Pelops extended his sway over the neighbouring Olympia, where he celebrated the Olympian games with a splendour unknown before. His power and fame were so great that henceforward the whole peninsula was known to the ancients as Peloponnesus, "island of Pelops" (νῆσος, island). In after times Pelops was honoured at Olympia above all other heroes; a temple was built for him by Heracles, his descendant in the fourth generation, in which the annual magistrates sacrificed to him a black ram.

From the reference to Asia in the tales of Tantalus, Niobe and Pelops it has been conjectured that Asia was the original seat of these legends, and that it was only after emigration to Greece that the people localized a part of the tale of Pelops in their new home. In the time of Pausanias the throne of Pelops was still shown on the top of Mt Sipylus. The story of Pelops is told in the first Olympian ode of Pindar and in prose by Nicolaus Damascenus.

PELOTA (Sp. "little ball," from Lat. *pila*), a ball game which, originating centuries ago in the Basque provinces, has developed into several forms of the sport. Epigrams of Martial show that there were at least three kinds of pelota played in his time. *Blaid*, practically hand fives against the back wall of a court, is still played on both sides of the Pyrenees. It is so popular that the authorities had to forbid its being played against the walls of the cathedral at Barcelona. In uncovered courts of large size there are two varieties of pelota. One, the favourite pastime of the Basque, is played against a front wall (*fronton*), either bare-handed, with a leather or wooden long glove-like protector (*cesta*), or with a *chistera* strapped to the wrist, a sickle-shaped wicker-work implement three feet long, much like a hansom-wheel basket mud-guard, in the narrow groove of which the ball is caught and from which, thanks to the leverage afforded, it can be hurled with tremendous force. There are several players to a side, frequently an uneven number to allow a handicap. The score is announced by a *cantara*, whose melodious vocal efforts make him not the least appreciated participant in the game. In the other form of the game, played nearly exclusively by professionals (*pelotaris*), there are usually three players on each side, two forwards and a back, distinguished by a coloured sash or cap. The server (*butteur*) slips off his *chistera* to serve, bouncing the ball on the *but*, a kind of stool, about 30 ft. from the wall, and

striking it low against the wall. The side that wins the toss has the first service. The ball must be replayed by the opposing side at the wall, which it must hit over a line 3 ft. from the base of the wall and under the net fixed at the top of the wall. The game is counted 15, 30, 40, game, reckoned by the number of faults made by the opposing side. A fault is scored (*a*) when after the service the ball is not caught on the volley or first bounce, (*b*) when it does not on the return strike the wall within the prescribed limits, (*c*) when it goes out of the prescribed limits of the court, (*d*) when it strikes the net fixed at the top of the court. The side making the fault loses the service. A game like this has been played in England by Spanish professionals on a court 250 ft. long, against a wall 30 ft. high and 55 ft. wide. The ball used, a trifle smaller than a base-ball, is hard rubber wound with yarn and leather-covered, weighing 5 oz. The server bounces the ball on the concrete floor quite near the *fronton*, and hits it with his *chistera* against the wall with a force to make it rebound beyond a line 80 ft. back. It usually goes treble that distance.

PELOTAS, a city of the state of Rio Grande do Sul, Brazil, on the left bank of the São Gonçalo river near its entrance into the Lagôa dos Patos, about 30 m. N.W. of the city of Rio Grande. Pop. (1900), city, about 24,000; *municipio* (commune, 1037 sq. m.), 43,091. The Rio Grande Bagé railway communicates with the city of Rio Grande, and with the railways extending to Bagé, Cacequy, Santa Maria, Passo Fundo and Porto Alegre. The São Gonçalo river is the outlet of Lagôa Mirim, and Pelotas is therefore connected with the inland water routes. The city is built on an open grassy plain (*campo*) little above the level of the lake (28 ft. above sea-level). The public buildings include the church of São Francisco, dating from the early part of the 19th century, the municipal hall, a fine theatre, the Misericordia hospital, a public library containing about 25,000 volumes and a great central market. Pelotas is the centre of the *xarque* or *carne secca* (jerked beef) industry of Rio Grande do Sul. In its outskirts and the surrounding country are an immense number of *xarqueadas* (slaughter-houses), with large open yards where the dressed beef, lightly salted, is exposed to the sun and air. There are many factories or packing houses where the by-products are prepared for market. Pelotas was only a small settlement at the beginning of the 19th century and had no parochial organization until 1812. It became a *villa* in 1830 and a city in 1835.

PELOUZE, THÉOPHILE JULES (1807–1867), French chemist, was born at Valognes, in Normandy, on the 26th (or 13th) of February 1807. His father, Edmond Pelouze (d. 1847), was an industrial chemist and the author of several technical handbooks. The son, after spending some time in a pharmacy at La Fère, acted as laboratory assistant to Gay-Lussac and J. L. Lassaigne (1800–1859) at Paris from 1827 to 1829. In 1830 he was appointed associate professor of chemistry at Lille, but returning to Paris next year became repétiteur, and subsequently professor, at the École Polytechnique. He also held the chair of chemistry at the Collège de France, and in 1833 became assayer to the mint and in 1848 president of the commission des monnaies. After the *coup d'état* in 1851 he resigned his appointments, but continued to conduct a laboratory school he had started in 1846. He died in Paris on the 1st of June 1867. Though Pelouze made no discovery of outstanding importance, he was a busy investigator, his work including researches on salicin, on beetroot sugar, on various organic acids—gallic, malic, tartaric, butyric, lactic, &c.—on oenanthic ether (with Liebig), on the nitrosulphates, on gun-cotton, and on the composition and manufacture of glass. He also carried out determinations of the atomic weights of several elements, and with E. Frémy published *Traité de chimie générale* (1847–1850); *Abrégé de chimie* (1848); and *Notions générales de chimie* (1853).

PELTIER, JEAN CHARLES ATHANASE (1785–1845), French physicist, was born at Ham (Somme) on the 22nd of February 1785. He was originally a watchmaker, but retired from business about the age of thirty and devoted himself to experimental and observational science. His papers, which are numerous, are devoted in great part to atmospheric electricity, waterspouts, cyanometry and polarization of skylight, the temperature of water in the spheroidal state, and the boiling-point at great elevations. There are also a few devoted to curious points of natural history. But his name will always be associated with the thermal effects at junctions in a voltaic circuit. His great experimental discovery, known as the "Peltier effect," was that if a current pass from an external source through a circuit of two metals it *cools* the junction through which it passes in the same direction as the thermo-electric current which would be caused by directly heating that junction, while it heats the other junction (see THERMO-ELECTRICITY). Peltier died in Paris on the 27th of October 1845.

PELTUINUM [mod. Civita Ansidonia], a town of the Vestini, on the Via Claudia Nova, 12 m. E.S.E. of Aquila. It was apparently the chief town of that portion of the Vestini who dwelt west of the main Apennine chain. Remains of the town walls, of an amphitheatre, and of other buildings still exist.

PELUSIUM, an ancient city and port of Egypt, now represented by two large mounds close to the coast and the edge of the desert, 20 m. E. of Port Said. It lay in the marshes at the mouth of the most easterly (Pelusiac) branch of the Nile, which has long since been silted up, and was the key of the land towards Syria and a strong fortress, which, from the Persian invasion at least, played a great part in all wars between Egypt and the East. Its name has not been found on Egyptian monuments, but it may be the Sin of the Bible and of Assur-bani-pal's inscription. Pelusium ("the muddy") is the Faramā of the Arabs, Peremoun in Coptic; the name Ṭīna which clings to the locality seems etymologically connected with the Arabic word for clay or mud. The site, crowned with extensive ruins of burnt brick of the Byzantine or Arab period, has not yielded any important remains. (F. Ll. G.)

PELVIS (Lat. for "basin," cf. Gr. πέλλις), in anatomy, the bony cavity at the lower part of the abdomen in which much of the genito-urinary apparatus and the lower part of the bowels are contained (see SKELETON, § *Appendicular*).

PEMBA, an island in the Indian Ocean off the east coast of Africa, forming part of the sultanate of Zanzibar. Pemba lies 30 m. N.N.E. of Zanzibar island between 4° 80′ and 5° 30′ S., and 39° 35′ and 39° 50′ E. It is some 40 m. long and 10 across at its broadest part, and has an area of 380 sq. m. It is of coral-line formation. On the side facing the mainland the coast is much indented. From its luxuriant vegetation it gets its Arabic name of Al-huthera- -"the Green." The interior is diversified by hills, some of which exceed 600 ft. The land is chiefly owned by great Arab proprietors, who work their plantations with Swahili labour, and with negroes from the mainland. Prior to 1897 the labourers were all slaves. Their gradual manumission was accomplished without injury to the prosperity of the island. The population is estimated at between 50,000 and 60,000, of whom 2000 to 3000 are Arabs. Most of the inhabitants are of Bantu stock, and are known as Wapemba. In the ports there are many Hindu traders and a few Europeans. The plantations are nearly all devoted to cloves (the annual average output being 10,000,000 ℔) and coco-nut palms (for the preparation of copra). The number of coco-nut plantations is very small compared with those devoted to cloves. Yet cloves need much care and attention and yield small profit, while the coco-nut palm yields a fairly uniform crop of nuts and will grow almost anywhere. The preponderance of clove plantations dates from a cyclone which in 1872 destroyed nearly all the clove-trees in the island of Zanzibar. Thereupon, to benefit from the great rise in the price of cloves, the Pemba planters cut down their palms and planted cloves. The value of the cloves exported in 1907 was £339,000, or 92% of the total exports. India, Germany and Great Britain are, in the order named, the chief purchasers. Other exports include fire-wood, skins and hides, mother-of-pearl, wax and small quantities of rubber, cowries, tortoiseshell and so-called tortoise-nail. The "tortoise-nail" is the valve with which a shell-fish closes its shell. The Llandolphia rubber-vine is indigenous, and since 1906 Ceara rubber-trees have been

extensively planted. Rice, the chief of Pemba's imports, could easily be grown on the island. Cotton cloths (Kangas) form the next most considerable item in the imports.

Pemba has three ports, all on the west side of the island. Shaki-Shaki, the capital and the centre of trade, is centrally situated at the head of a shallow tidal creek partly blocked by dense growths of mangroves. Mkoani is on the south-west coast, Kishi-Kashi on the north-west coast; at the last-named port there is a deep and well-sheltered harbour, approached however by a narrow and dangerous channel.

Pemba is administered as an integral part of the Zanzibar dominions, and yields a considerable surplus to the exchequer, mainly from a 25% duty imposed on cloves exported. There is a weekly steamship service to Zanzibar, and in 1907 the two islands were connected by wireless telegraphy (see ZANZIBAR).

PEMBROKE, EARLS OF. The title of earl of Pembroke has been held successively by several English families, the jurisdiction and dignity of a palatine earldom being originally attached to it. The first creation dates from 1138, when the earldom of Pembroke was conferred by King Stephen on Gilbert de Clare (d. 1148), son of Gilbert Fitz-Richard, who possessed the lordship of Strigul (Estrighoiel, in *Domesday Book*), the modern Chepstow. After the battle of Lincoln (1141), in which he took part, the earl joined the party of the empress Matilda, and he married Henry I.'s mistress, Isabel, daughter of Robert de Beaumout, earl of Leicester.

RICHARD DE CLARE, 2nd earl of Pembroke (d. 1176), commonly known as "Strongbow," son of the first earl, succeeded to his father's estates in 1148, but had forfeited or lost them by 1168. In that year Dermot, king of Leinster, driven out of his kingdom by Roderick, king of Connaught, came to solicit help from Henry II. He secured the services of Earl Richard, promising him the hand of his daughter Eva and the succession to Leinster. The earl crossed over in person (1170), took both Waterford and Dublin, and was married to Eva. But Henry II., jealous of this success, ordered all the troops to return by Easter 1171. In May Dermot died; this was the signal of a general rising, and Richard barely managed to keep Roderick of Connaught out of Dublin. Immediately afterwards he hurried to England to solicit help from Henry II., and surrendered to him all his lands and castles. Henry crossed over in October 1172; he stayed in Ireland six months, and put his own men into nearly all the important places, Richard keeping only Kildare. In 1173 he went in person to France to help Henry II., and was present at Verneuil, being reinstated in Leinster as a reward. In 1174 he advanced into Connaught and was severely defeated, but fortunately Raymond le Gros re-established his supremacy in Leinster. Early in 1176 Richard died, just as Raymond had taken Limerick for him. Strongbow was the statesman, as the Fitzgeralds were the soldiers, of the conquest. He is vividly described by Giraldus Cambrensis as a tall and fair man, of pleasing appearance, modest in his bearing, delicate in features, of a low voice, but sage in council and the idol of his soldiers. He was buried in the cathedral church of Dublin, where his effigy and that of his wife are still preserved.

See Giraldus Cambrensis, *Expugnatio hibernica*; and the *Song of Dermot*, edited by G. H. Orpen (1892).

Strongbow having died without male issue, his daughter ISABEL became countess of Pembroke in her own right, and the title was borne by her husband, SIR WILLIAM MARSHAL, or Le Maréchal, second son of John le Maréchal, by Sibylle, the sister of Patrick, earl of Salisbury. John le Maréchal was a partisan of the empress Matilda, and died about 1164.

The date of Sir William Marshal's birth is uncertain, but his parents were married not earlier than 1141, and he was a mere child in 1152, when he attracted the notice of King Stephen. In 1170 he was selected for a position in the household of Prince Henry, the heir-apparent, and remained there until the death of his young patron (1183). He undertook a pilgrimage to the Holy Land, where he served as a crusader with distinction for two years. Although he had abetted the prince in rebellion he was pardoned by Henry II. and admitted to the royal service about 1188. In 1189 he covered the flight of Henry II. from Le Mans to Chinon, and, in a skirmish, unhorsed the undutiful Richard Cœur de Lion. None the less Richard, on his accession, promoted Marshal and confirmed the old king's licence for his marriage with the heiress of Strigul and Pembroke. This match gave Marshal the rank of an earl, with great estates in Wales and Ireland, and he was included in the council of regency which the king appointed on his departure for the third crusade (1190). He took the side of Prince John when the latter expelled the justiciar, William Longchamp, from the kingdom, but he soon discovered that the interests of John were different from those of Richard. Hence in 1193 he joined with the loyalists in making war upon the prince. Richard forgave Marshal his first error of judgment, allowed him to succeed his brother, John Marshal, in the hereditary marshalship, and on his death-bed designated him as custodian of Rouen and of the royal treasure during the interregnum. Though he quarrelled more than once with John, Marshal was one of the few English laymen who clung to the royal side through the Barons' War. He was one of John's executors, and was subsequently elected regent of the king and kingdom by the royalist barons in 1216. In spite of his advanced age he prosecuted the war against Prince Louis and the rebels with remarkable energy. In the battle of Lincoln (May 1217) he charged and fought at the head of the young king's army, and he was preparing to besiege Louis in London when the war was terminated by the naval victory of Hubert de Burgh in the straits of Dover. He was criticized for the generosity of the terms he accorded to Louis and the rebels (September 1217); but his desire for an expeditious settlement was dictated by sound statesmanship. Self-restraint and compromise were the key-notes of Marshal's policy. Both before and after the peace of 1217 he reissued Magna Carta. He fell ill early in the year 1219, and died on the 14th of May at his manor of Caversham near Reading. He was succeeded in the regency by Hubert de Burgh, in his earldom by his five sons in succession.

See the metrical French life, *Histoire de Guillaume le Maréchal* (ed. P. Meyer, 3 vols., Paris, 1891–1901); the *Minority of Henry III.*, by G. J. Turner (*Trans. Royal Hist. Soc.*, new series, vol. xviii. pp. 245–295); and W. Stubbs, *Constitutional History*, chs. xii. and xiv. (Oxford, 1896–1897).

Marshal's eldest son, WILLIAM MARSHAL (d. 1231), 2nd earl of Pembroke of this line, passed some years in warfare in Wales and in Ireland, where he was justiciar from 1224 to 1226; he also served Henry III. in France. His second wife was the king's sister, Eleanor, afterwards the wife of Simon de Montfort, but he left no children. His brother RICHARD MARSHAL (d. 1234), 3rd earl, came to the front as the leader of the baronial party, and the chief antagonist of the foreign friends of Henry III. Fearing treachery he refused to visit the king at Gloucester in August 1233, and Henry declared him a traitor. He crossed to Ireland, where Peter des Roches had instigated his enemies to attack him, and in April 1234 he was overpowered and wounded, and died a prisoner. His brother GILBERT (d. 1241), who became the 4th earl, was a friend and ally of Richard, earl of Cornwall. When another brother, Anselm, the 6th earl, died in December 1245, the male descendants of the great earl marshal became extinct. The extensive family possessions were now divided among Anselm's five sisters and their descendants, the earldom of Pembroke reverting to the Crown.

The next holder of the lands of the earldom of Pembroke was William de Valence (d. 1296), a younger son of Hugh de Lusignan, count of La Marche, by his marriage with Isabella of Angoulême (d. 1246), widow of the English king John, and was born at Valence, near Lusignan. In 1247 William and his brothers, Guy and Aymer, crossed over to England at the invitation of their half-brother, Henry III. In 1250 Aymer (d. 1260) was elected bishop of Winchester, and in 1247 Henry arranged a marriage between William and Joan de Munchensi (d. 1307), a granddaughter of William Marshal, 1st earl of Pembroke. The custody of Joan's property, which included the castle and lordship of Pembroke, was entrusted to her husband, who in 1295 was summoned to parliament as earl of Pembroke. In South Wales

Valence tried to regain the palatine rights which had been attached to the earldom of Pembroke. But his energies were not confined to South Wales. Henry III. heaped lands and honours upon him, and he was soon thoroughly hated as one of the most prominent of the rapacious foreigners. Moreover, some trouble in Wales led to a quarrel between him and Simon de Montfort, and this soon grew more violent. He would not comply with the provisions of Oxford, and took refuge in Wolvesey Castle at Winchester, where he was besieged and compelled to surrender and leave the country. In 1259 he and Earl Simon were formally reconciled in Paris, and in 1261 he was again in England and once more enjoying the royal favour. He fought for Henry at the battle of Lewes, and then, after a stay in France, he landed in Pembrokeshire, and took part in 1265 in the siege of Gloucester and the battle of Evesham. After the royalist victory he was restored to his estates and accompanied Prince Edward, afterwards Edward I., to Palestine. He went several times to France on public business; he assisted in the conquest of North Wales; and he was one of Edward's representatives in the famous suit over the succession to the crown of Scotland in 1291 and 1292. He died at Bayonne on the 13th of June 1296, his body being buried in Westminster Abbey. His eldest surviving son, Aymer (*c.* 1265–1324), succeeded to his father's estates, but was not formally recognized as earl of Pembroke until after the death of his mother Joan about 1307. He was appointed guardian of Scotland in 1306, but with the accession of Edward II. to the throne and the consequent rise of Piers Gaveston to power, his influence sensibly declined; he became prominent among the discontented nobles and was one of those who were appointed to select the lord ordainers in 1311. In 1312 he captured Gaveston at Scarborough, giving the favourite a promise that his life should be spared. Ignoring this undertaking, however, Guy Beauchamp, earl of Warwick, put Gaveston to death, and consequently Pembroke left the allied lords and attached himself to Edward II. Valence was present at Bannockburn; in 1317, when returning to England from Rome, he was taken prisoner and was kept in Germany until a large ransom was paid. In 1318 he again took a conspicuous part in making peace between Edward and his nobles, and in 1322 assisted at the formal condemnation of Earl Thomas of Lancaster, and received some of his lands. His wife, Mary de Chatillon, a descendant of King Henry III., was the founder of Pembroke College, Cambridge.

In 1339 Laurence, Lord Hastings (d. 1348), a great-grandson of William de Valence, having inherited through the female line a portion of the estates of the Valence earls of Pembroke was created, or recognized as, earl of Pembroke. His son John (d. 1376) married Margaret Plantagenet, daughter of King Edward III., and on the death without issue of his grandson in 1389 the earldom of Pembroke reverted again to the Crown, while the barony of Hastings became dormant and so remained till 1840.

In 1414 Humphrey Plantagenet, fourth son of King Henry IV., was created duke of Gloucester and earl of Pembroke for life, these titles being subsequently made hereditary, with a reversion as regards the earldom of Pembroke, in default of heirs to Humphrey, to William de la Pole, earl of Suffolk. Accordingly, on the death of Humphrey, without issue, in 1447 this nobleman became earl of Pembroke. He was beheaded in 1450 and his titles were forfeited. In 1453 the title was given to Sir Jasper Tudor, half-brother of King Henry VI. Sir Jasper being a Lancastrian, his title was forfeited during the predominance of the house of York, but was restored on the accession of Henry VII. On his death without heirs in 1495, his title became extinct.

During his attainder Sir Jasper was taken prisoner by Sir William Herbert (d. 1469), a zealous Yorkist, who had been raised to the peerage as Baron Herbert by Edward IV., and for this service Lord Herbert was created earl of Pembroke in 1468. His son William (d. 1491) received the earldom of Huntingdon in lieu of that of Pembroke, which he surrendered to Edward IV., who thereupon conferred it (1479) on his son Edward, prince of Wales; and when this prince succeeded to the throne as Edward V., the earldom of Pembroke merged in the crown. Anne Boleyn, a few months previous to her marriage with Henry VIII., was created marchioness of Pembroke in 1532. It is doubted by authorities on peerage law whether the title merged in the royal dignity on the marriage of the marchioness to the king, or became extinct on her death in 1536.

The title of earl of Pembroke was next revived in favour of Sir William Herbert (*c.* 1501–1570), whose father, Richard, was an illegitimate son of the 1st earl of Pembroke of the house of Herbert. He had married Anne Parr, sister of Henry VIII.'s sixth wife, and was created earl in 1551. The title has since been held by his descendants.

An executor of Henry VIII.'s will and the recipient of valuable grants of land, Herbert was a prominent and powerful personage during the reign of Edward VI., both the protector Somerset and his rival, John Dudley, afterwards duke of Northumberland, angling for his support. He threw in his lot with Dudley, and after Somerset's fall obtained some of his lands in Wiltshire and a peerage. It has been asserted that he devised the scheme for settling the English crown on Lady Jane Grey; at all events he was one of her advisers during her short reign, but he declared for Mary when he saw that Lady Jane's cause was lost. By Mary and her friends Pembroke's loyalty was at times suspected, but he was employed as governor of Calais, as president of Wales and in other ways. He was also to some extent in the confidence of Philip II. of Spain. The earl retained his place at court under Elizabeth until 1569, when he was suspected of favouring the projected marriage between Mary, queen of Scots, and the duke of Norfolk. Among the monastic lands granted to Herbert was the estate of Wilton, near Salisbury, still the residence of the earls of Pembroke.

His elder son Henry (*c.* 1534-1601), who succeeded as 2nd earl, was president of Wales from 1586 until his death. He married in 1577 Mary Sidney, the famous countess of Pembroke (*c.* 1561–1621), third daughter of Sir Henry Sidney and his wife Mary Dudley. Sir Philip Sidney to whom she was deeply attached through life, was her eldest brother. Sir Philip Sidney spent the summer of 1580 with her at Wilton, or at Ivychurch, a favourite retreat of hers in the neighbourhood. Here at her request he began the *Countess of Pembroke's Arcadia*, which was intended for her pleasure alone, not for publication. The two also worked at a metrical edition of the Psalms. When the great sorrow of her brother's death came upon her she made herself his literary executor, correcting the unauthorized editions of the *Arcadia* and of his poems, which appeared in 1590 and 1591. She also took under her patronage the poets who had looked to her brother for protection. Spenser dedicated his *Ruines of Time* to her, and refers to her as Urania in *Colin Clout's come home againe*; in Spenser's *Astrophel* she is "Clorinda." In 1599 Queen Elizabeth was her guest at Wilton, and the countess composed for the occasion a pastoral dialogue in praise of Astraea. After her husband's death she lived chiefly in London at Crosby Hall, where she died.

The Countess's other works include: *A Discourse of Life and Death*, translated from the French of Plessis du Mornay (1593), and *Antoine* (1592), a version of a tragedy of Robert Garnier.

William Herbert, 3rd earl of Pembroke (1580–1630), son of the 2nd earl and his famous countess, was a conspicuous figure in the society of his time and at the court of James I. Several times he found himself opposed to the schemes of the duke of Buckingham, and he was keenly interested in the colonization of America. He was lord chamberlain of the royal household from 1615 to 1625 and lord steward from 1626 to 1630. He was chancellor of the university of Oxford in 1624 when Thomas Tesdale and Richard Wightwick refounded Broadgates Hall and named it Pembroke College in his honour. By some Shakespearian commentators Pembroke has been identified with the "Mr W. H." referred to as "the onlie begetter" of Shakespeare's sonnets in the dedication by Thomas Thorpe, the owner of the published manuscript, while his mistress, Mary Fitton (*q.v.*), has been identified with the "dark lady" of the sonnets. In both

cases the identification rests on very questionable evidence (see SHAKESPEARE, WILLIAM). He and his brother Philip are the "incomparable pair of brethren" to whom the first folio of Shakespeare is inscribed. The earl left no sons when he died in London on the 10th of April 1630. Clarendon gives a very eulogistic account of Pembroke, who appears, however, to have been a man of weak character and dissolute life. Gardiner describes him as the Hamlet of the English court. He had literary tastes and wrote poems; one of his closest friends was the poet Donne, and he was generous to Ben Jonson, Massinger and others.

His brother, PHILIP HERBERT, the 4th earl (1584-1650), was for some years the chief favourite of James I., owing this position to his comely person and his passion for hunting and for field sports generally. In 1605 the king created him earl of Montgomery and Baron Herbert of Shurland, and since 1630, when he succeeded to the earldom of Pembroke, the head of the Herbert family has carried the double title of earl of Pembroke and Montgomery. Although Philip's quarrelsome disposition often led him into trouble he did not forfeit the esteem of James I., who heaped lands and offices upon him, and he was also trusted by Charles I., who made him lord chamberlain in 1626 and frequently visited him at Wilton. He worked to bring about peace between the king and the Scots in 1639 and 1640, but when in the latter year the quarrel between Charles and the English parliament was renewed, he deserted the king who soon deprived him of his office of chamberlain. Trusted by the popular party, Pembroke was made governor of the Isle of Wight, and he was one of the representatives of the parliament on several occasions, notably during the negotiations at Uxbridge in 1645 and at Newport in 1648, and when the Scots surrendered Charles in 1647. From 1641 to 1643, and again from 1647 to 1650, he was chancellor of the university of Oxford; in 1648 he removed some of the heads of houses from their positions because they would not take the solemn league and covenant, and his foul language led to the remark that he was more fitted "by his eloquence in swearing to preside over Bedlam than a learned academy." In 1649, although a peer, he was elected and took his seat in the House of Commons as member for Berkshire, this "ascent downwards" calling forth many satirical writings from the royalist wits. The earl was a great collector of pictures and had some taste for architecture. His eldest surviving son, Philip (1621-1669), became 5th earl of Pembroke, and 2nd earl of Montgomery; he was twice married, and was succeeded in turn by three of his sons, of whom Thomas, the 8th earl (*c.* 1656-1733), was a person of note during the reigns of William III. and Anne. From 1690 to 1692 he was first lord of the admiralty; then he served as lord privy seal until 1699, being in 1697 the first plenipotentiary of Great Britain at the congress of Ryswick. On two occasions he was lord high admiral for a short period; he was also lord president of the council and lord-lieutenant of Ireland, while he acted as one of the lords justices seven times; and he was president of the Royal Society in 1689-1690. His son Henry, the 9th earl (*c.* 1689-1750), was a soldier, but was better known as the "architect earl." He was largely responsible for the erection of Westminster Bridge. The title descended directly to Henry, 10th earl (1734-1794), a soldier, who wrote the *Method of Breaking Horses* (1762); George Augustus, 11th earl (1759-1827), an ambassador extraordinary to Vienna in 1807; and Robert Henry, 12th earl (1791-1862), who died without issue. George Robert Charles, the 13th earl (1850-1895), was a grandson of the 11th earl and a son of Baron Herbert of Lea (*q.v.*), whose second son Sidney (b. 1853) inherited all the family titles at his brother's death.

See G. T. Clark, *The Earls, Earldom and Castle of Pembroke* (Tenby, 1880); J. R. Planché, "The Earls of Strigul" in vol. x. of the *Proceedings of the British Archaeological Association* (1855); and G. E. C(okayne), *Complete Peerage*, vol. vi. (London, 1895).

PEMBROKE, a town of Ontario, Canada, capital of Renfrew county, 74 m. W.N.W., of Ottawa by rail on the south shore of Allumette Lake, an expansion of the Ottawa River, and on the Canadian Pacific and Canada Atlantic railways. Pop. (1901), 5156. It is the seat of a Roman Catholic bishopric, an important centre in the lumber trade, and contains saw, grist and woollen mills, axe factory, &c. The Muskrat River affords excellent water-power.

PEMBROKE (*Penfro*), an ancient municipal borough, a contributory parliamentary borough and county-town of Pembrokeshire, Wales, situated on a narrow peninsula at the head of the Pennar tidal inlet or "pill" of Milford Haven. Pop. (1901), 4487; together with Pembroke Dock 15,853. Pembroke is a station on the South Wales system of the Great Western railway. The old-fashioned town, consisting chiefly of one long broad street, retains portions of its ancient walls. A large mill-dam is a conspicuous feature on the north of the town. St Mary's church in the centre of the town possesses a massive tower of the 12th century. Near the ruined West Gate is the entrance to Pembroke Castle, a splendid specimen of medieval fortified architecture. The circular vaulted keep erected by Earl William Marshal (*c.* 1200), remains almost intact. Close to the keep stands the ruined chamber wherein, according to local tradition, Henry VII. was born in 1457. Beneath the fine banqueting hall, a flight of steps descends into "the Wogan," a vast subterranean chamber giving access to the harbour. Facing the castle, on the western side of the pill, stand the considerable remains of Monkton Priory, a Benediction house founded by Earl William Marshal as a cell to the abbey of Séez or Sayes in Normandy, but under Henry VI. transferred to the abbey of St Albans. The priory church, now the parish church of the suburb of Monkton, contains monuments of the families of Meyrick of Bush and Owen of Orielton. St Daniel's chapel forms a prominent landmark on the ridge south of the town.

PEMBROKE DOCK (formerly known as Pater, or Paterchurch), a naval dockyard and garrison town, is situated close to Hobb's Point, at the eastern extremity of Milford Haven. It forms the Pater Ward of Pembroke, from which it is distant 2 m. to the north-west. The place owes its origin to the decision of the government in 1814 to form a naval dépôt on Milford Haven. The dockyard, enclosed by high walls and covering 80 acres, is protected by a powerful fort—the construction and repairing of ironclads are extensively carried on here. There is a submarine dépôt at Pennar Gut, and also accommodation for artillery and infantry. Ferry boats ply frequently between Pembroke Dock and Neyland on the opposite shore of the Haven.

Pembroke is probably an Anglo-Norman form of the Cymric *Penfro*, the territory lying between Milford Haven and the Bristol Channel, now known as the Hundred of Castlemartin. During the invasion of South Wales under William Rufus, Arnulf de Montgomeri, fifth son of Roger earl of Shrewsbury, seems to have erected a fortress of stone (*c.* 1090) on the site of the castle. The first castellan of this new stronghold was Giraldus de Windsor, husband of the Princess Nest of South Wales and grandfather of Giraldus Cambrensis. Throughout the 12th and 13th centuries the castle was strengthened and enlarged under successive earls palatine of Pembroke, who made this fortress their chief seat. As the capital of the palatinate and as the nearest port for Ireland, Pembroke was in Plantagenet times one of the most important fortified cities in the kingdom. The town, which had grown up under the shadow of the almost impregnable castle, was first incorporated by Henry I. in 1109 and again by Earl Richard de Clare in 1154 (who also encircled the town with walls), and these privileges were confirmed and extended under succeeding earls palatine and kings of England. In 1835 the corporation was remodelled under the Municipal Corporations Act. Henry II. occasionally visited Pembroke, notably in 1172, and until the close of the Wars of the Roses, both town and castle played a prominent part in the history of Britain. With the passing of the Act of Union of Wales and England in 1536 however the *jura regalia* of the county palatine of Pembroke were abolished, and the prosperity of the town began to decline. Although acknowledged as the county town of Pembrokeshire, Pembroke was superseded by Haverfordwest as the judicial and administrative centre of the shire on account of the more convenient position of the latter place. By the act of 1536 Pembroke was declared the leading borough in the

Pembroke parliamentary district, yet the town continued to dwindle until the settlement of the government dockyard and works on Milford Haven. At the outbreak of the Civil Wars the town and castle were garrisoned for parliament by the mayor, John Poyer, a leading Presbyterian, who was later appointed governor, with Rowland Laugharne of St Brides for his lieutenant. But at the time of the Presbyterian defection in 1647, Poyer and his lieutenant-governors, Laugharne and Powell, declared for Charles and held the castle in the king's name. In June 1648 Cromwell himself proceeded to invest Pembroke Castle, which resisted with great obstinacy. But after the water-supply of the garrison had been cut off, the besieged were forced to capitulate, on the 11th of July 1648, on the condition of surrendering up the three chief defenders of the castle. Poyer, Laugharne and Powell were accordingly brought to London, but finally only Poyer was executed. The magnificent ruin of Pembroke Castle is the nominal property of the Crown, but has been held on lease since the reign of James II. by the family of Pryse of Gogerddan in Cardiganshire.

PEMBROKESHIRE (*Sir Benfro, Dyfed*), the most westerly county of South Wales, bounded N.E. by Cardigan, E. by Carmarthen, S. by the Bristol Channel and W. and N.W. by St Bride's Bay and Cardigan Bay of St George's Channel. Area, 615 sq. m. The whole coast is extremely indented, extending over 140 m. in length. The principal inlets are Milford Haven, St Bride's Bay, Freshwater Bay, Fishguard Bay and Newport Bay. The chief promontories are Cemmaes, Dinas, Strumble, St David's, St Ann's and St Gowan's Heads. Five islands of moderate size lie off the coast, viz. Ramsey, Grassholm, Skomer and Skokholm in St Bride's Bay, and Caldy Island (Ynys Pyr) opposite Tenby; the last named having a population of about 70 persons. Rare birds, such as peregrine falcons, ravens and choughs are not uncommon, while guillemots, puffins and other sea-fowl breed in immense numbers on the Stack Rocks, on Ramsey Island and at various points of the coast. Seals are plentiful in the caves of St Bride's Bay and Cardigan Bay. The county is undulating, and large tracts are bare, but the valleys of the Cleddau, the Nevern, the Teifi and the Gwaun are well-wooded. The Preselley Mountains stretch from Fishguard to the border of Carmarthen, the principal heights being Preselley Top (1760 ft.) and Carn Englyn (1022 ft.). Treffgarn Rock in the Plumstone Mountains is popularly supposed to mark the northern limit of the ancient settlement of the Flemings. The principal rivers are the Teifi, forming the northern boundary of the county from Abercych to Cardigan Bay; the Nevern and the Gwaun, both falling into Cardigan Bay; and the Eastern and Western Cleddau, forming the Daugleddau after their junction below Haverfordwest. All these streams contain trout and salmon. There are no lakes, but the broad tidal estuaries of the Daugleddau and other rivers, which fall into Milford Haven and are locally called "pills," constitute a peculiar feature of south Pembrokeshire scenery.

Geology.—Pembrokeshire is divisible into a northern portion occupied mainly by Ordovician and Silurian strata, which have been subjected to pressures from the north, the strike of the beds being south-west-north-east; and a southern portion, the westerly continuation of the South Wales coalfield, with associated Lower Carboniferous, Old Red Sandstone and narrow belts of Silurian rocks, the whole having been considerably folded and faulted by pressure from the south, which has produced a general north-west-south-east strike. In the neighbourhood of St Davids are the Pre-Cambrian granitic rocks (Dimetian) and volcanic rocks (Pebedian). These are surrounded by belts of unconformable Cambrian strata (Lingula Flags, Tremadoc beds), followed by Ordovician (Arenig, Llandeilo and Bala beds) with associated igneous rocks. These comprise gabbros and diabases of Strumble Head, Fishguard, Llanwnda, Prescelly; diorites north-west of St Davids, bostonites and porphyrites about Abercastle and the basaltic laccolite of Pen Caer, besides various contemporaneous acid lavas and tuffs. The Ordovician and Silurian rocks extend southward to the neighbourhood of Narberth and Haverfordwest, where Arenig, Llandeilo and Bala beds (Slade and Red Hill beds; Sholeshook and Robeston Walthen Limestone) and Llandovery beds are recorded. The Coal Measures, highly inclined and anthracitic, stretch across from Carmarthen Bay to the shore of St Bride's Bay; they are bordered on the north and south-east by the Millstone Grits, Carboniferous Limestone series and Old Red Sandstone. On account of the folding the limestone appears again farther south at Pembroke, Caldy Island and St Gowan's Head; most of the remaining ground about Milford Haven being occupied by Old Red Sandstone with infolded strips of Silurian. A fairly large tract of blown-sand occurs in Freshwater Bay south of Milford Haven. Silver-bearing lead has been mined at Llanfyrnach.

Climate and Industries.—The climate is everywhere mild, and in the sheltered valleys near the coast sub-tropical vegetation flourishes in the open air. In the south the rainfall is small, and the districts round Pembroke suffer from occasional droughts. The chief industry is agriculture, wherein stock-raising is preferred to the growing of cereals. Of cattle the long-horned, jet-black Castlemartin breed is everywhere conspicuous. South Pembroke has long been celebrated for its horses, which are bred in great numbers by the farmers. The deep-sea fisheries of Tenby and Milford are valuable; and fresh fish of good quality is exported by rail to the large towns. Oysters are found at Langwm and near Tenby; lobsters and crabs abound on the western coast. The South Wales coalfield extends into south Pembroke, and coal is worked at Saundersfoot, Begelly, Templeton, Kilgetty and other places. There are slate quarries at Glogue, Cilgerran and elsewhere; copper has been worked near St Davids, and lead at Llanfyrnach.

Communications.—The South Wales branch of the Great Western railway enters Pembrokeshire from the east near Clynderwen Junction, whence the main line leads to Fishguard Harbour with its important Irish traffic. Other lines proceed to Neyland and Milford Haven by way of Haverfordwest, and a branch line from Clynderwen to Goodwick joins the main line at Letterston. The Whitland-Cardigan branch traverses the north-east by way of Crymmych and Cilgerran. Another line running south-west from Whitland proceeds by way of Narberth and Tenby to Pembroke Dock.

Population and Administration.—The area of Pembrokeshire is 395,151 acres with a population in 1891 of 89,138 and in 1901 of 88,732, showing a slight decrease. The municipal boroughs are Pembroke (pop. 15,853); Haverfordwest (6007); and Tenby (4400). The hamlet of Bridgend and a part of St Dogmell's parish are included within the municipal limits of Cardigan. Newport (Trêfdraeth) (1222), the chief town of the barony of Kemes, or Cemmaes, still possesses a mayor and corporation under a charter granted in 1215 by Sir Nicholas Martein, lord of Kemes, whose hereditary representative still nominates the mayor and aldermen, but its surviving municipal privileges are practically honorary. Milford Haven (5102), Narberth (1070) and Fishguard (2002) are urban districts. Other towns are St Davids (1710), St Dogmells (Llandudoch) (1286); and Cilgerran (1038). Pembrokeshire lies in the South Wales circuit, and assizes are held at Haverfordwest. Two members are returned to parliament; one for the county, and one for the united boroughs of Pembroke, Haverfordwest, Tenby, Fishguard, Narberth, Neyland, Milford and Wiston (Castell Gwys). Ecclesiastically, the county contains 153 parishes and lies wholly in the diocese of St Davids.

History.—Pembrokeshire, anciently known to the Welsh as Dyfed, was originally comprised in the territory of the Dimetae, conquered by the Romans. During the 6th century St David, or Dewi Sant, moved the chief seat of South Welsh monastic and ecclesiastical life from Caerleon-on-Usk to his native place Menevia, which, known in consequence as Tyddewi, or St Davids, continued a centre of religious and educational activity until the Reformation, a period of 1000 years. On the death of Rhodri Mawr in 877, Dyfed fell nominally under the sway of the princes of Deheubarth, or South Wales; but their hold was never very secure, nor were they able to protect the coast towns from the Scandinavian pirates. In 1081 William the Conqueror penetrated west as far as St Davids, where he is said to have visited St David's shrine as a devout pilgrim. In 1092 Arnulf de Montgomeri, son of Roger, earl of Shrewsbury, did homage to the king for the Welsh lands of Dyfed. With the building of Pembroke Castle, of which Gerald de Windsor was appointed castellan, the Normans began to spread over southern Dyfed; whilst Martin de Tours, landing in Fishguard

Bay and building the castle of Newport at Trêfdraeth, won for himself the extensive lordship of Kemes (Cemmaes) between the river Teifi and the Preselley Mountains. The systematic planting of Flemish settlers in the hundred of Rhôs, or Roose, in or about the years 1106, 1108 and 1111 with the approval of Henry I., and again in 1156 under Henry II., marks an all-important episode in the history of Pembrokeshire. The castles of Haverfordwest and Tenby were now erected to protect these aliens, and despite the fierce attacks of the Welsh princes their domain grew to be known as "Little England beyond Wales," a district whereof the language, customs and people still remain characteristic. In 1138 Gilbert de Clare, having previously obtained Henry I.'s permission to enjoy all lands he might win for himself in Wales, was created earl of Pembroke in Stephen's reign with the full powers of an earl palatine in Dyfed. The devolution of this earldom is dealt with in a separate article.

In 1536, by the Act of Union (27 Henry VIII.), the king abolished all special jurisdiction in Pembrokeshire, which he placed on an equal footing with the remaining shires of Wales, while its borders were enlarged by the addition of Kemes, Dewisland and other outlying lordships. By the act of 1536 the county returned to parliament one knight for the shire and two burgesses: one for the Pembroke boroughs and one for the town and county of Haverfordwest, both of which since 1885 have been merged in the Pembroke-and-Haverfordwest parliamentary division. The Reformation deprived the county of the presence of the bishops of St Davids, who on the partial dismantling of the old episcopal palace at St Davids removed their chief seat of residence to Abergwiliy, near Carmarthen. Meanwhile the manor of Lamphey was granted to the family of Devereux, earls of Essex, and other episcopal estates were alienated to court favourites, notably to Sir John Perrot of Haroldstone (1517–1592), afterwards lord-deputy of Ireland. During the Civil Wars the forces of the parliament, commanded by Colonel Laugharne and Captain Swanley, reduced the royal forts at Tenby, Milford and Haverfordwest. In February 1797 some French frigates appeared off Fishguard Bay and landed about 1400 Frenchmen at Llanwnda. The invaders soon capitulated to the local militia, practically without striking a blow. The 19th century saw the establishment of the naval dockyard at Paterchurch and the building of docks and quays at Neyland and Milford. In 1906 extensive works for cross-traffic with Ireland were opened at Fishguard Harbour.

Many of the old Pembrokeshire families, whose names appear prominent in the county annals, are extinct in the county itself. Amongst these may be mentioned Perrot of Haroldstone, Devereux of Lamphey, Barlow of Slebech, Barrett of Gilliswick, Wogan of Wiston, Elliot of Amroth and Owen of Henllys. Amongst ancient families still existing are Philipps of Lydstep and Amroth (descendants of the old Welsh lords of Cilsant); Philipps of Picton Castle (a branch of the same house in the female line); Lort of Stackpole Court, now represented by Earl Cawdor; Scourfield of Moate; Bowen of Llwyngwair; Edwardes, Lords Kensington, of St Brides; Meyrick of Bush; Lort-Philipps of Lawrenny; Colby of Ffynone; Stokes of Cuffern; Lloyd of Newport Castle (in which family is vested the hereditary lordship of the barony of Kemes); Saunders-Davies of Pentre; and Gower of Castle Malgwyn.

Antiquities.—There are few remaining traces in the county of the Roman occupation of Dimetia, but in British encampments, tumuli, cromlechs and monumental stones Pembrokeshire is singularly rich. Of the cromlechs the best preserved are those at Longhouse, near Mathry; at Pentre Evan in the Nevern Valley; and at Llech-y-dribedd, near Moylgrove; whilst of the many stone circles and alignments, that known as Parc-y-Marw, or "the Field of the Dead," near Fishguard, is the least injured. Stones inscribed in Ogam characters are not uncommon, and good examples exist at Caldy Island, Bridell, St Dogmells and Cilgerran. There are good specimens of Celtic floriated churchyard crosses at Carew, Penally and Nevern. Interesting examples of medieval domestic architecture are the ruins of the former episcopal mansions at Llawhaden, St Davids and Lamphey, the two latter of which were erected by Bishop Gower between the years 1328–1347. With the exception of the cathedral at St Davids and the principal churches of Haverfordwest and Tenby, the parish churches of Pembrokeshire are for the most part small, but many are ancient and possess fine monuments or other objects of interest, especially in "Little England beyond Wales." Amongst the more noteworthy are the churches at Stackpole Elidur, Carew, Burton Gumfreston, Nevern, St Petrox and Rudbaxton, the last-named containing a fine Jacobean monument of the Hayward family. Pembrokeshire has long been famous for its castles, of which the finest examples are to be observed at Pembroke; Manorbier, built in the 12th century and interesting as the birthplace and home of Giraldus Cambrensis; Carew, exhibiting many interesting features both of Norman and Tudor architecture; and Picton, owned and inhabited by a branch of the Philipps family. Other castles are the keep of Haverfordwest and the ruined fortresses at Narberth, Tenby, Newport, Wiston, Benton, Upton and Cilgerran. There are some remains of monastic houses at Tenby and Pembroke, but the most important religious communities were the priory of the Augustinian friars at Haverfordwest and the abbey of the Benedictines at St Dogmells. Of this latter house, which was founded by Martin de Tours, first lord of Kemes, at the close of the 11th century, and who owned the priories of Pill and Caldy, considerable ruins exist near the left bank of the Teifi about 1 m. below Cardigan. Of the ancient preceptory of the Knights of St John at Slebech scarcely a trace remains, but of the college of St Mary at St Davids founded by Bishop Houghton in 1377, the shell of the chapel survives in fair preservation. Pembrokeshire contains an unusually large number of county seats, particularly in the south, which includes Stackpole Court, the residence of Earl Cawdor, a fine mansion erected in the 18th century; Picton Castle; Slebech, once the seat of the Barlows; Orielton, formerly belonging to the Owens; and Ffynone, the residence of the Colby family.

Customs, &c.—The division of Pembrokeshire ever since the 12th century into well-defined Englishry and Welshry has produced two distinct sets of languages and customs within the county. Roughly speaking, the English division, the *Anglia Transwalliana* of Camden, occupies the south-eastern half and comprises the hundreds of Roose, Castlemartin, Narberth and Dungleddy. In the Welshry, which includes the hundreds of Dewisland and Cilgerran together with the old barony of Kemes, the language, customs, manners and folk-lore of the inhabitants are almost identical with those of Cardigan and Carmarthen. The old Celtic game of *Knappan*, a pastime partaking of the nature both of football and hockey, in which whole parishes and even hundreds were wont to take an active part, was prevalent in the barony of Kemes so late as the 16th century, as George Owen of Henllys, the historian and antiquary, records; and the playing of *knappan* lingered on after Owen's day. Amongst the settlers of the Englishry, who are of mingled Anglo-Saxon, Flemish, Welsh and perhaps Scandinavian descent, many interesting superstitions and customs survive. The English spoken by these dwellers in "Little England beyond Wales" contains many curious idioms and words and the pronunciation of some of the vowels is peculiar. Certain picturesque customs, many of them dating from pre-Reformation times, are still observed, notably in the neighbourhood of Tenby. Such are the sprinkling of persons with dewy evergreens on New Year's morning; the procession of the Cutty Wren on St Stephen's day, and the constructing of little huts at Lammastide by the farm boys and girls. As early as the opening years of the 19th century, cripples and ophthalmic patients were in the habit of visiting the ancient hermitage at St Gowan's Head to bathe in its sacred well; and Richard Fenton, the county historian alludes (*c.* 1808) to the many crutches left at St Gowan's chapel by grateful devotees. Belief in ghosts, fairies, witches, &c., is still prevalent in the more remote places, and the dress of the fishwives of Langwm near Haverfordwest is highly picturesque with its short skirt, scarlet shawl and buckled shoes.

Authorities.—Richard Fenton, *A Historical Tour through Pembrokeshire* (London, 1810); Edward Laws, *History of Little England beyond Wales* (London, 1888); Basil Jones and E. A. Freeman, *History and Antiquities of St David's* (London, 1856), &c.

PEMMICAN, a North American Indian (Cree) word for a meat prepared in such a way as to contain the greatest amount of nourishment in the most compact form. As made by the Indians it was composed of the lean parts of the meat, dried in the sun, and pounded or shredded and mixed into a paste with melted fat. It is flavoured with acid berries. If kept dry it will keep for an indefinite time, and is thus particularly serviceable in arctic or other explorations.

PEMPHIGUS (Gr. πέμφιξ, a bubble), a skin disease, in which large blebs appear, on a red base, containing a clear or yellowish fluid; the blebs occasion much irritation, and when they burst leave raw ulcerated surfaces. The disease is principally known in unhealthy or neglected children. A variety of the malady, *pemphigus foliaceous*, affects the whole body, and gradually proves fatal. Pemphigus of an acute septicaemic type occurs in butchers or those who handle hides, and a diplococcus has been isolated by William Bullock. The treatment is mainly constitutional, by means of good nourishment, warm baths, local sedatives and tonics. In chronic pemphigus, streptococci have been found in the blebs, and the opsonic index was low to streptococci. Improvement has been known to take place on the injection of a vaccine of streptococci.

PEN (Lat. *penna*, a feather, pen), an instrument for writing or for forming lines with an ink or other coloured fluid. The English word, as well as its equivalents in French (*plume*) and in German (*Feder*), originally means a wing-feather, but in ancient times the implements used for producing written characters were not quills. The earliest writing implement was probably the stilus (Gr. γραφίς), a pointed bodkin of metal, bone or ivory, used for producing incised or engraved letters on boxwood tablets covered with wax. The calamus (Gr. κάλαμος) or arundo, the hollow tubular stalk of grasses growing in marshy lands, was the true ancient representative of the modern pen; hollow joints of bamboo were similarly employed.

An early specific allusion to the quill pen occurs in the writings of St Isidore of Seville (early part of the 7th century),[1] but there is no reason to assume that it was not in use at a still more remote date. The quills still largely employed among Western communities as writing instruments are obtained principally from the wings of the goose (see Feather). In 1809 Joseph Bramah devised and patented a machine for cutting up the quill into separate nibs by dividing the barrel into three or even four parts, and cutting these transversely into "two, three, four and some into five lengths." Bramah's invention first familiarized the public with the appearance and use of the nib slipped into a holder. In 1818 Charles Watt obtained a patent for gilding and preparing quills and pens, which may be regarded as the precursor of the gold pen. But a more distinct advance was effected in 1822, when J. I. Hawkins and S. Mordan patented the application of horn and tortoise-shell to the formation of pen-nibs, the points of which were rendered durable by small pieces of diamond, ruby or other very hard substance, or by lapping a small piece of thin sheet gold over the end of the tortoise-shell.

Steel Pens.

Metallic pens, though not unknown in classical times—a bronze pen found at Pompeii is in the Naples Museum—were little used until the 19th century and did not become common till near the middle of that century. It is recorded that a Birmingham split-ring manufacturer, Samuel Harrison, made a steel pen for Dr Joseph Priestley in 1780. Steel pens made and sold in London by a certain Wise in 1803 were in the form of a tube or barrel, the edges of which met to form the slit, while the sides were cut away as in the case of an ordinary quill. Their price was about five shillings each, and as they were hard, stiff and unsatisfactory instruments they were not in great demand. A metallic pen patented by Bryan Donkin in 1808 was made of two separate parts, flat or nearly so, with the flat sides placed opposite each other to form the slit, or alternatively of one piece, flat and not cylindrical as in the usual form, bent to the proper angle for insertion in the tube which constituted the holder. To John Mitchell probably belongs the credit of introducing machine-made pens, about 1822, and James Perry is believed to have been the first maker of steel slip pens. In 1828 Josiah Mason, who had been associated with Samuel Harrison, in the manufacture of split rings, saw Perry's pens on sale in Birmingham, and after examining them saw his way both to improve and to cheapen the process of making them. He therefore put himself in communication with Perry, and the result was that he began to make barrel pens for him in 1828 and slip pens in 1829. Perry, who did much to popularize the steel pen and bring it into general use, in his patent of 1830 sought to obtain greater flexibility by forming a central hole between the points and the shoulders and by cutting one or more lateral slits on each side of the central slit; and Joseph Gillot, in 1831 described an improvement which consisted in forming elongated points on the nibs of the pens.

The metal used consists of rolled sheets of cast steel of the finest quality made from Swedish charcoal iron. These sheets, after being cut into strips of suitable width, annealed in a muffle-furnace and pickled in a bath of dilute sulphuric acid to free the surface from oxidized scale, are rolled between steel rollers till they are reduced to ribbons of an even thickness, about $\frac{1}{160}$ in. From these ribbons the pen blanks are next punched out, and then, after being embossed with the name of the maker or other marks, are pierced with the central perforation and the side or shoulder slits by which flexibility is obtained. After another annealing, the blanks, which up to this point are flat, are "raised" or rounded between dies into the familiar semi-cylindrical shape. The next process is to harden and temper them by heating them in iron boxes in a muffle-furnace, plunging them in oil, and then heating them over a fire in a rotating cylindrical vessel till their surfaces attain the dull blue tint characteristic of spring-steel elasticity. Subsequently they are "scoured" in a bath of dilute acid, and polished in a revolving cylinder. The grinding of the points with emery follows, and then the central slit is cut by the aid of two very fine-edged cutters. Finally the pens are again polished, are coloured by being heated over a fire in a revolving cylinder, and in some cases are coated with a varnish of shellac dissolved in alcohol. Birmingham was the first home of the steel-pen industry, and continues its principal centre. The manufacture on a large scale was begun in the United States about 1860 at Camden, N. J., where the Esterbrook Steel Pen Manufacturing Company was incorporated in 1866.

Gold Pens.

Metals other than steel have frequently been suggested by inventors, those most commonly proposed being gold, silver, zinc, German silver, aluminium and aluminium bronze. Dr W. H. Wollaston, it is recorded, had a gold pen composed of two thin strips of gold tipped with rhodium, apparently made on the principle patented by Donkin in 1808, and Lord Byron used one in 1810. Gold being extremely resistant to corrosion, pens made of it are very durable, but the metal is too soft for the points, which wear quickly unless protected by some harder material. For this purpose iridium is widely employed, by fusing the gold round it with a blowpipe.

Reservoir Pens.

Various devices have been adopted in order to increase the time for which a pen can be used without a fresh supply of ink. These fall into two main classes. In one, the form of the nib itself is modified, or some attachment is added, to enlarge the ink capacity; in the other, which is by far the more important, the holder of the pen is utilized as a cistern or reservoir from which ink is supplied to the nib. Pens of the second class, which have the further advantage of being portable, are heard of under the name of "fountain inkhorns" or "fountain pens" so far back as the beginning of the 18th century, but it was not till a hundred

[1] "Instrumenta scribae calamus et penna; ex his enim verba paginis infiguntur; sed calamus arboris est, penna avis, cujus acumen dividitur in duo."

years later that inventors applied themselves seriously to their construction. Joseph Bramah patented several plans; one was to employ a tube of silver or other metal so thin that it could be readily squeezed out of shape, the ink within it being thus forced out to the nib, and another was to fit the tube with a piston that could slide down the interior and thus eject ink. In modern fountain pens a feed bar conveys, by capillary action, a fresh supply of ink to replace that which has been left on the paper in the act of writing, means being also provided by which air can pass into the reservoir and fill the space left empty by the outflowing ink. In another form of reservoir pen, which is usually distinguished by the name stylograph, there is no nib, but the ink flows out through a minute hole at the end of the holder, which terminates in a conical point. An iridium needle, held in place by a fine spring, projects slightly through the hole and normally keeps the aperture closed; but when the pen is pressed on the paper, the needle is pushed back and allows a thin stream of ink to flow out.

See J. P. Maginnis, "Reservoir, Stylographic and Fountain Pens," *Cantor Lectures*, Society of Arts (1905).

PENALTY (Lat. *poena*, punishment), in its original meaning, a punishment inflicted for some violation of the law or rule of conduct. Although still freely used in its original sense in such phrases, for example, as "the death penalty," "the penalty of rashness," &c., the more usual meaning attached to the word is that of a pecuniary mulct. Penalty is used specifically for a sum of money recovered by virtue of a penal statute, or recoverable in a court of summary jurisdiction for infringement of a statute. A sum of money agreed upon to be paid in case of non-performance of a condition in a bond or in breach of a contract or any stipulation of it is also termed a penalty (see DAMAGES).

PENANCE (Old Fr. *penance*, fr. Lat. *poenitentia*, penitence), strictly, repentance of sins. Thus in the Douai version of the New Testament the Greek word μετάνοια is rendered "penance," where the Authorized Version has "repentance," The two words, similar in their derivation and original sense, have however come to be symbolical of conflicting views of the essence of repentance, arising out of the controversy as to the respective merits of "faith" and "good works." The Reformers, upholding the doctrine of justification by faith, held that repentance consisted in a change of the whole moral attitude of the mind and soul (*ἐπιστρέφεσθαι*, Matt. xiii. 15; Luke xxii. 32), and that the Divine forgiveness followed true repentance and confession to God without any reparation of "works." This is the view generally held by Protestants. In the Roman Catholic Church the sacrament of penance consists of three parts: *contritio, confessio, satisfactio. Contritio* is in fact repentance as Protestant theologians understand it, *i.e.* sorrow for sin arising from love of God, and long before the Reformation the schoolmen debated the question whether complete "contrition" was or was not in itself sufficient to obtain the Divine pardon. The Council of Trent, however, decided, that "reconciliation" could not follow such contrition without the other parts of the sacrament, which form part of it (*sine sacramenti voto, quod in illa includatur*). Contrition is also distinguished from "attrition" (*attritio*), *i.e.* repentance due to fear of punishment. It was questioned whether a state of mind thus produced would suffice for obtaining the benefits of the sacrament; this point was also set at rest by the Council of Trent, which decided that attrition, though not in itself capable of obtaining the justification of the sinner, is also inspired by God and thus disposes the soul to benefit by the grace of the sacrament.

The word "penance," applied to the whole sacrament, is also used of the works of satisfaction imposed by the priest on the penitent, *i.e.* the temporal punishment (*poena*). This varies with the character and heinousness of the offences committed. In the middle ages "doing penance" was often a process as terrible and humiliating to the penitent as it was possibly edifying to the Church. Public penances have, however, long been abolished in all branches of the Christian Church. (See CONFESSION.)

PENANG (*Pulau Pinang, i.e.* Areca-nut Island), the town and island which, after Singapore, form the most important portion of the Crown colony of the Straits Settlements. The island is situated in 5° 24′ N. and 100° 21′ E., and distant about 2½ m. from the west coast of the Malay Peninsula. The island is about 15½ m. long by 10½ m. wide at its broadest point. Its area is something over 107 sq. m. The town, which is built on a promontory at a point nearest to the mainland, is largely occupied by Chinese and Tamils, though the Malays are also well represented. Behind the town, Penang Hill rises to a height of some 2700 ft., and upon it are built several government and private bungalows. The town possesses a fine European club, a racecourse, and good golf links. Coco-nuts are grown in considerable quantities along the seashore, and rice is cultivated at Bālek Pūlau and in the interior, but the jungle still spreads over wide areas. Penang has an excellent harbour, but has suffered from its proximity to Singapore. There are a Church of England and a Roman Catholic church in the town, and a training college under the Roman Catholic missionaries of the Société des Missions Étrangères at Pūlau Tīkus, a few miles outside the town.

Administration.—Since 1867 Penang has been under the administrative control of a resident councillor who is responsible to the governor of the Straits. He is aided in his duties by officers of the Straits Civil Service. Two unofficial members of the legislative council of the colony, which holds its sittings in Singapore, are nominated by the governor, with the sanction of the secretary of state for the colonies, to represent Penang. Their term of office is for five years. The official name of the island is Prince of Wales Island and that of the town is Georgetown; neither of these names, however, is in general use. Among the Malays Penang is usually spoken of as *Tanjong* or "The Cape," on account of the promontory upon which the town is situated. The town is administered by a municipal council composed of *ex officio*, nominated, and elected members.

Population.—The population of Penang at the time of the census of 1901 was 128,830, of whom 85,070 were males (69,210 over and 15,860 under 15 years of age), and 43,760 were females (28,725 over and 15,035 under 15 years of age). The population was composed of 71,462 Chinese, 34,286 Malays, 18,740 Tamils and other natives of India, 1649 Eurasians, 993 Europeans and Americans, and 1699 persons of other nationalities. As in other parts of the Straits Settlements the men are far more numerous than the women. The total population of the settlement of Penang, which includes not only the island but Province Wellesley and the Dindings, was 248,207 in 1901.

Shipping.—The number of ships which entered and left the port of Penang during 1906 was 2324 with an aggregate tonnage of 2,868,459. Of these 1802 were British with an aggregate tonnage of 1,966,286. These figures reveal a considerable falling-off during the past decade, the number of vessels entering and leaving the port in 1898 being 5114 with an aggregate tonnage of 3,761,094. This is mainly due to the construction of the railway which runs from a point on the mainland opposite to Penang, through the Federated Malay States of Pĕrak, Selāngor and the Nĕgri Sĕmbilan to Malacca, and has diverted to other ports and eventually to Singapore much of the coastal traffic which formerly visited Penang.

Finance and Trade.—The revenue of Penang, that is to say, not only of the island but of the entire settlement, amounted in 1906 to $6,031,917, of which $2,014,033 was derived from the revenue farms for the collection of import duties on opium, wine and spirits; $160,047 from postal revenue; $119,585 from land revenue; $129,151 from stamps. The expenditure for 1906 amounted to $5,072,406, of which $836,097 was spent on administrative establishments, $301,252 on the upkeep of existing public works; $415,175 on the construction of works and buildings, and of new roads, streets, bridges, &c. The imports in 1906 were valued at $94,546,112; the exports at $90,709,225. Of the imports $57,880,889 worth came from the United Kingdom or from British possessions or protectorates; $23,937,737 worth came from foreign countries; and $3,906,241 from the Dindings, Malacca and Singapore. Of the exports, $23,122,947 went to the United Kingdom, or to British possessions or protectorates; $37,671,033 went to foreign countries; and $2,754,238 went to the Dindings, Malacca or Singapore.

History.—Penang was founded on the 17th of July 1786, having been ceded to the East India Company by the Sultan of Kēdah in 1785 by an agreement with Captain Light, for an annuity of $10,000 for eight years. In 1791 the subsidy was

changed to \$6000, in perpetuity; but some years later this was raised to \$10,000, and is still annually paid. This final addition was made when Province Wellesley was purchased by the East India Company for \$2000 in 1798. At the time of the cession Penang was almost uninhabited. In 1796 it was made a penal settlement, and 700 convicts were transferred thither from the Andaman Islands. In 1805 Penang was made a separate presidency, ranking with Bombay and Madras; and when in 1826 Singapore and Malacca were incorporated with it, Penang continued to be the seat of government. In 1829 Penang was reduced from the rank of a presidency, and eight years later the town of Singapore was made the capital of the Settlements. In 1867 the Straits Settlements were created a Crown colony, in which Penang was included.

See *Straits Settlements Blue Book 1906* (Singapore, 1907); *The Straits Directory* (Singapore, 1907); Sir Frank Swettenham, *British Malaya* (London, 1906). (H. Cl.)

PENARTH, an urban district and seaport in the southern parliamentary division of Glamorganshire, Wales, 166 m. by rail from London, picturesquely situated on rising ground on the south side of the mouth of the Ely opposite Cardiff, from which it is 4 m. distant by rail and 2 m. by steamer. Pop. (1901), 14,228. The place derives its name from two Welsh words, "pen," a head, and "garth," an enclosure. Penarth was a small and unimportant village until a tidal harbour at the mouth of the Ely was opened in 1859, and a railway, 6 m. long, was made about the same time, connecting the harbour with the Taff Vale railway at Radyr. A dock, authorized in 1857, was opened in 1865, when all three undertakings, which had cost £775,000, were leased in perpetuity to the Taff Vale Railway Company. The monopoly which the Bute Docks at Cardiff had previously enjoyed in shipping coal from the valleys of the Taff and Rhondda was thus terminated. The town is frequented in summer as a bathing-place, and the Rhaetic beds at the head are of special interest to geologists. On this head there stood an old church, probably Norman, which served as a landmark for sailors. The remains of an old chantry have been converted into a barn. Besides two Established and one Roman Catholic church, the principal buildings of Penarth are its various Nonconformist chapels, intermediate and technical school (1894), custom-house, dock offices, and Turner House with a private art gallery which is thrown open on certain days to the public. Three miles to the west is Dinas Powis Castle. In 1880–1883 gardens were laid out along the cliff, in 1894 a promenade and landing-pier with a length of 630 ft. were constructed, and in 1900 a marine subway open at all times for foot passsngers was made under the river Ely. The dock, as first constructed, comprised 17½ acres, was extended in 1884 at a cost of £250,000, and now covers 23 acres with a basin of 3 acres. It is 2900 ft. in length, has a minimum depth of 26 ft., and is furnished with every modern appliance for the export of coal, of which from 20,000 to 30,000 tons can be stored in the sidings near by. The Penarth—Ely tidal harbour has a water area of 55 acres with a minimum depth of 20 ft., and a considerable import trade is carried on here mainly by coasting vessels; but as only one of its sides has wharves (about 3000 ft. along) scarcely more than 5% of the total shipping of the port is done here. It has commodious warehouses, also tanks to hold about 6000 tons of oil.

PENATES (from Lat. *penus*, eatables, food), Roman gods of the store-room and kitchen. The store-room over which they presided was, in old times, beside the *atrium*, the room which served as kitchen, parlour, and bedroom in one; but in later times the store-room was in the back part of the house. It was sanctified by the presence of the Penates, and none but pure and chaste persons might enter it, just as with the Hindus the kitchen is sacred and inviolable. They had no individual names, but were always known under the general designation, Penates. Closely associated with the Penates were the Lares (*q.v.*) another species of domestic deity, who seem to have been the deified spirits of deceased ancestors. But while each family had two Penates it had but one Lar. In the household shrine the image of the Lar (dressed in a toga) was placed between the two images of the Penates, which were represented as dancing and elevating a drinking-horn in token of joy and plenty. The three images together were sometimes called Penates, sometimes Lares, and either name was used metaphorically for "home." The shrine stood originally in the *atrium*, but when the hearth and the kitchen were separated from the *atrium* and removed to the back of the house, and meals were taken in an upper storey, the position of the shrine was also shifted. In the houses at Pompeii it is sometimes in the kitchen, sometimes in the rooms. In the later empire it was placed behind the house-door, and a taper or lamp was kept burning before it. But the worship in the interior of the house was also kept up even into Christian times; it was forbidden by an ordinance of Theodosius (A.D. 392). The old Roman used, in company with his children and slaves, to offer a morning sacrifice and prayer to his household gods. Before meals the blessing of the gods was asked, and after the meal, but before dessert, there was a short silence, and a portion of food was placed on the hearth and burned. If the hearth and the images were not in the eating-room, either the images were brought and put on the table, or before the shrine was placed a table on which were set a salt-cellar, food and a burning lamp. Three days in the month, viz. the Calends, Nones and Ides (*i.e.* the first, the fifth or seventh, and the thirteenth or fifteenth), were set apart for special family worship, as were also the *Caristia* (Feb. 22) and the *Saturnalia* in December. On these days as well as on such occasions as birthdays, marriages, and safe returns from journeys, the images were crowned and offerings made to them of cakes, honey, wine, incense, and sometimes a pig. As each family had its own Penates, so the state, as a collection of families, had its public Penates. Intermediate between the worship of the public and private Penates were probably the rites (*sacra*) observed by each clan (*gens*) or collection of families supposed to be descended from a common ancestor. The other towns of Latium had their public Penates as well as Rome. The sanctuary of the whole Latin league was at Lavinium. To these Penates at Lavinium the Roman priests brought yearly offerings, and the Roman consuls, praetors and dictators sacrificed both when they entered on and when they laid down their office. To them, too, the generals sacrificed before departing for their province. Alba Longa, the real mother-city of Latium, had also its ancient Penates, and the Romans maintained the worship on the Alban mount long after the destruction of Alba Longa. The Penates had a temple of their own at Rome. It was on the Velia near the Forum, and has by some been identified with the round vestibule of the church of SS. Cosma e Damiano. In this and many other temples the Penates were represented by two images of youths seated holding spears. The Penates were also worshipped in the neighbouring temple of Vesta. To distinguish the two worships it has been supposed that the Penates in the former temple were those of Latium, while those in the temple of Vesta were the Penates proper of Rome. Certainly the worship of the Penates, whose altar was the hearth and to whom the kitchen was sacred, was closely connected with that of Vesta, goddess of the domestic hearth.

The origin and nature of the Penates was a subject of much discussion to the Romans themselves. They were traced to the mysterious worship of Samothrace; Dardanus, it was said, took the Penates from Samothrace to Troy, and after the destruction of Troy, Aeneas brought them to Italy and established them at Lavinium. From Lavinium Ascanius carried the worship to Alba Longa, and from Alba Longa it was brought to Rome. Equally unsatisfactory with this attempt to connect Roman religion with Greek legend are the vague and mystic speculations in which the later Romans indulged respecting the nature of the Penates. Some said they were the great gods to whom we owe breath, body and reason, viz. Jupiter representing the middle ether, Juno the lowest air and the earth, and Minerva the highest ether, to whom some added Mercury as the god of speech (Servius, on *Aen.* ii. 296; Macrobius, *Sat.* iii. 4, 8; Arnobius, *Adv. Nat.* iii. 40). Others identified them with Apollo

and Neptune (Macrob. iii. 4, 6; Arnob. *loc. cit.*; Servius, on *Aen.* iii. 119). The Etruscans held the Penates to be Ceres, Pales and Fortuna, to whom others added Genius Jovialis (Servius on *Aen.* ii. 325; Arnob. *loc. cit.*). The late writer Martianus Capella records the view that heaven was divided into sixteen regions, in the first of which were placed the Penates, along with Jupiter, the Lares, &c. More fruitful than these misty speculations is the suggestion, made by the ancients themselves, that the worship of these family gods sprang from the ancient Roman custom (common to many savage tribes) of burying the dead in the house. But this would account for the worship of the Lares rather than of the Penates. A comparison with other primitive religious beliefs suggests the conjecture that the Penates may be a remnant of fetishism or animism. The Roman genii seem certainly to have been fetishes and the Penates were perhaps originally a species of genii. Thus the Penates, as simple gods of food, are probably much more ancient than deities like Jupiter, Neptune, Apollo and Minerva.

With the Penates we may compare the kindly household gods of old Germany; they too had their home on the kitchen hearth and received offerings of food and clothing. In the castle of Hudemühlen (Hanover) there was a kobold for whom a cover was always set on the table. In Lapland each house had one or more spirits. The souls of the dead are regarded as house-spirits by the Russians; they are represented as dwarfs, and are served with food and drink. Each house in Servia has its patron-saint. In the mountains of Mysore every house has its bhuta or guardian deity, to whom prayer and sacrifices are offered. The Chinese god of the kitchen presents some curious analogies to the Penates: incense and candles are burnt before him on the first and fifteenth of the month; some families burn incense and candles before him daily; and on great festivals, one of which is at the winter solstice (nearly corresponding to the Saturnalia), he is served with cakes, pork, wine, incense, &c., which are placed on a table before him.

See ROMAN RELIGION. (J. G. FR.; X.)

PENCIL (Lat. *penicillus*, brush, literally little tail), a name originally applied to a small fine-pointed brush used in painting, and still employed to denote the finer camel's-hair and sable brushes used by artists, but now commonly signifying solid cones or rods of various materials used for writing and drawing. It has been asserted that a manuscript of Theophilus, attributed to the 13th century, shows signs of having been ruled with a black-lead pencil; but the first distinct allusion occurs in the treatise on fossils by Conrad Gesner of Zurich (1565), who describes an article for writing formed of wood and a piece of lead, or, as he believed, an artificial composition called by some *stimmi anglicanum* (English antimony). The famous Borrowdale mine in Cumberland having been discovered about that time, it is probable that we have here the first allusion to that great find of graphite. While the supply of the Cumberland mine lasted, the material for English pencils consisted simply of the native graphite as taken from the mine. The pieces were sawn into thin sheets, which again were cut into the slender square rods forming the "lead" of the pencil.

Strenuous efforts were made on the continent of Europe and in England to enable manufacturers to become independent of the product of the Cumberland mine. In Nuremberg, where the great pencil factory of the Faber family (*q.v.*) was established in 1760, pencils were made from pulverized graphite cemented into solid blocks by means of gums, resins, glue, sulphur and other such substances, but none of these preparations yielded useful pencils. In the year 1795 N. J. Conté (*q.v.*), of Paris, devised the process by which now all black-lead pencils, and indeed pencils of all sorts, are manufactured. In 1843 William Brockedon patented a process for compressing pure black-lead powder into solid compact blocks by which he was enabled to use the dust, fragments, and cuttings of fine Cumberland lead. Brockedon's process would have proved successful but the exhaustion of the Borrowdale supplies and the excellence of Conté's process rendered it more of scientific interest than of commercial value.

The pencil leads prepared by the Conté process consist of a mixture of graphite and clay. The graphite, having been pulverized and subjected to any necessary purifying processes, is "floated" through a series of settling tanks, in each of which the comparatively heavy particles sink, and only the still finer particles are carried over. That which sinks in the last of the series is in a condition of extremely fine division, and is used for pencils of the highest quality. The clay, which must be free from sand and iron, is treated in the same manner. Clay and graphite so prepared are mixed together in varying proportions with water to a paste, passed repeatedly through a grinding mill, then placed in bags and squeezed in a hydraulic press till they have the consistency of stiff dough, in which condition they are ready for forming pencil rods. For this purpose the plastic mass is placed in a strong upright cylinder, from which a plunger or piston, moved by a screw, forces it out through a perforated base-plate in a continuous thread. This thread is finally divided into suitable lengths, which are heated in a closed crucible for some hours. The two factors which determine the comparative hardness and blackness of pencils are the proportions of graphite and clay in the leads and the heat to which they are raised in the crucible. According as the proportion of graphite is greater and the heat lower the pencil is softer and of deeper black streak.

The wood in which the leads are cased is pencil cedar from *Juniperus virginiana* for the best qualities, and pine for the cheaper ones. A board of the selected wood, having a thickness about equal to half the diameter of the finished pencil and as wide as four or six pencils, is passed through a machine which smooths the surface and cuts round or square grooves to receive the leads. The leads being placed in the grooves the board is covered with another similarly grooved board, and the two are fastened together with glue. When dry they are taken to rapidly revolving cutters which remove the wood between the leads. The individual pencils thus formed only need to be finished by being dyed and varnished and stamped with name, grade, &c. Instead of wood, paper has been tried for the casings, rolled on in narrow strips which are torn off to expose fresh lead as the point becomes worn down by use.

Black pencils of an inferior quality are made from the dust of graphite melted up with sulphur and run into moulds. Such, with a little tallow added to give them softness, are the pencils commonly used by carpenters. Coloured pencils consist of a mixture of clay, with appropriate mineral colouring matter, wax, and tallow, treated by the Conté method, as in making lead pencils. In indelible and copying pencils the colouring matter is an aniline preparation mixed with clay and gum. The mixture not only makes a streak which adheres to the paper, but, when the writing is moistened with water, it dissolves and assumes the appearance and properties of an ink.

PENDA, king of Mercia (d. 654 or 655), son of Pybba, probably came to the throne in 626, but it is doubtful whether he actually became king of Mercia until 633, the year of the defeat and death of Edwin of Northumbria. According to the Anglo-Saxon Chronicle he was eighty years old at his death, but the energy of his administration and the evidence with regard to the ages of his children and relatives render it almost impossible. In 628 the Chronicle records a battle between him and the West Saxons at Cirencester in that year. In 633 Penda and Ceadwalla overthrew Edwin at Hatfield Chase; but after the defeat of the Welsh king by Oswald at "Hefenfelth" in 634, Mercia seems to have been for a time subject to Northumbria. In 642 Penda slew Oswald at a place called Maerfeld. He was continually raiding Northumbria and once almost succeeded in reducing Bamborough. He drove Cenwalh of Wessex, who had divorced his sister, from his throne. In 654 he attacked the East Angles, and slew their king Anna (see EAST ANGLIA). In 654 or 655 he invaded Northumbria in spite of the attempts of Oswio to buy him off, and was defeated and slain on the banks of the "Winwaed." In the reign of Penda the districts corresponding to Cheshire, Shropshire and Herefordshire were probably acquired, and he established his son Peada as a dependent prince in Middle Anglia. Although a pagan, he allowed his daughter Cyneburg to marry Alchfrith, the son of

Oswio, and it was in his reign that Christianity was introduced into Middle Anglia by his son Peada.

See Bede, *Hist. Eccl.* (ed. C. Plummer, Oxford, 1896); *Anglo-Saxon Chronicle* (ed. Earle and Plummer, Oxford, 1899).

PENDANT (through Fr. from Lat. *pendere*, to hang), any hanging object, such as a jewel or other ornament hanging from a brooch, bracelet, &c., or the loose end of a knight's belt left hanging after passing through the buckle, and terminating in an ornamental end. In architecture the word is applied to an elongated boss, either moulded or foliated, such as hangs down from the intersection of ribs, especially in fan tracery, or at the end of hammer beams. Sometimes long corbels, under the wall pieces, have been so called. The name has also been given to the large masses depending from enriched ceilings, in the later works of the Pointed style. "Pendants" or "Pendent posts" are those timbers which are carried down the side of the wall from the plate, and receive the hammer braces.

PENDENTIVE, the term given in architecture to the bridging across the angles of a square hall, so as to obtain a circular base for a dome or drain. This may be done by corbelling out in the angles, in which case the pendentive may be a portion of a hemisphere of which the half diagonal of the square hall is the radius; or by throwing a series of arches across the angle, each ring as it rises advancing in front of the one below and being carried by it during its construction; in this case the base obtained is octagonal, so that corbels or small pendentives are required for each angle of the octagon, unless as in the church of SS. Sergius and Bacchus at Constantinople a portion of the dome is set back; or again, by a third method, by sinking a semicircular niche in the angle. The first system was that employed in St Sophia at Constantinople, and in Byzantine churches generally, also in the domed churches of Perigord and Aquitaine. The second is found in the Sassanian palaces of Serbistan and Firuzabad, and in medieval architecture in England, France and Germany, where the arches are termed "squinches." The third system is found in the mosque at Damascus, and was often adopted in the churches in Asia Minor. There is still another method in which the pendentive and cupola are part of the same hemispherical dome, and in this case the ring courses lie in vertical instead of horizontal planes, examples of which may be found in the vault of Magnesia on Maeander in Asia Minor, and in the tomb at Valence known as *le pendentif de Valence.* The problem is one which has taxed the ingenuity of many builders in ancient times; the bas-reliefs found at Nimrud show that in the 9th century B.C. domes were evidently built over square halls, and must have been carried on pendentives of some kind.

PENDER, SIR JOHN (1816–1896), British cable pioneer, was born in the Vale of Leven, Scotland, on the 10th of September 1816, and after attending school in Glasgow became a successful merchant in textile fabrics in that city and in Manchester. His name is chiefly known in connexion with submarine cables, of which on the commercial side he was an important promoter. He was one of the 345 contributors who each risked a thousand pounds in the Transatlantic Cable in 1857, and when the Atlantic Cable Company was ruined by the loss of the 1865 cable he formed the Anglo-American Telegraph Company to continue the work, but it was not till he had given his personal guarantee for a quarter of a million pounds that the makers would undertake the manufacture of a new cable. But in the end he was justified, and telegraphic communication with America became a commercial success. Subsequently he fostered cable enterprise in all parts of the world, and at the time of his death, which occurred at Footscray Place, Kent, on the 7th of July 1896, he controlled companies having a capital of 15 millions sterling and owning 73,640 nautical miles of cables. He represented Wick Burghs in parliament from 1872 to 1885 and from 1892 to 1896. He was made a K.C.M.G. in 1888 and was promoted in 1892 to be G.C.M.G. His eldest son James (b. 1841), who was M.P. for Mid Northamptonshire in 1895–1900, was created a baronet in 1897; and his third son, John Denison (b. 1855), was created a K.C.M.G. in 1901.

PENDLESIDE SERIES, in geology, a series of shales between the upper division of the Carboniferous Limestone and the Millstone Grits occurring in the Midlands between Stoke-on-Trent and Settle. It consists of black limestones at the base, followed by black shales with calcareous nodules, which pass into sandy shales with ganister-like sandstones. In places the series attains a thickness of 1500–1000 ft., and where it is thickest the Millstone Grits also attain their maximum thickness. The peculiarities of the series, which is characterized by a rich fauna with *Productus giganteus, P. striatus, Dibunophyllum, Cyathaxonia cornu* and *Lonsdaleia floriformis*, can be best studied on the western slope of Pendle Hill, Lancashire, in the valley of the Hodder, dividing the counties of Lancashire and Yorkshire, at Mam Tor and the Edale valley in Derbyshire, and Morredge, the Dane valley in north Staffordshire, Bagillt and Teilia in North Wales, and Scarlett and Poolvash, Isle of Man. The limestones at the base are hard, compact and fissile, often cherty, and vary much in the amount of calcium carbonate which they contain, at times passing into calcareous shales.

These limestones and shales contain a distinct fauna which appears for the first time in the Midlands, characterized by *Pterinopecten papyraceus, Posidoniella laevis, Posidonomya Becheri, Posidonomya membranacea, Nomismoceras rotiforme* and *Glyphioceras striatus.* Immediately below beds with this fauna are thin limestones with *Prolecanites compressus, Stroboceras bisulcatus*, many trilobites, and corals referable to the genera *Cyathaxonia, Zaphrentis* and *Amplexizaphrentis.* The fauna characteristic of the Carboniferous Limestone becomes largely extinct and is replaced by a shale fauna, but the oncoming of the age of Goniatites is shown by the presence in the upper part of the Carboniferous Limestone of numerous species and genera of this group, *Glyphioceras crenestria* being the most common and having the wider horizontal range. The whole Pendleside series can be divided into zones by the different species of Goniatites. At the base *Prolecanites compressus* characterizes the passage beds between the Carboniferous Limestone and the Pendlesides; *Nomismoceras rotiforme* and *Glyphioceras striatus* are found in a narrow zone immediately above. Then *Glyphioceras reticulatum* appears and reaches its maximum, and is succeeded by *Glyphioceras diadema* and *Glyphioceras spirale,* while immediately below the Millstone Grits *Glyphioceras bilingue* appears and passes up in that series. The Millstone Grits are characterized by the presence of *Gastrioceras Listeri.* The Pendleside series is therefore characterized by an Upper Carboniferous fauna, *Pterinopecten papyraceus, Posidoniella laevis* and some other species which pass up right through the Coal Measures appearing for the first time, and the base of the series marks the division between Upper and Lower Carboniferous times.

The series passes eastward into Belgium and thence into Germany, when the same fossil zones are found in the basin of Namur and the valley of the Dill. Traced westward the series is well developed in Co. Dublin and on the west coast of Cos. Clare and Limerick. There can be no doubt that the Pendleside series of the Midlands represents the Lower Culm of Codden Hill, north Devon, and the Lower Culm of the continent of Europe. The faunas in these localities have the same biological succession as in the midlands.

See Wheelton Hind and J. Allen Howe, *Quart. Journ. Geog. Soc.* vol. lvii. (1901), and numerous other papers by the first-named author. (W. Hi.)

PENDLETON, EDMUND (1721–1803), American lawyer and statesman, was born, of English Royalist descent, in Caroline county, Virginia, on the 9th of September 1721. He was self-educated, but after reading law and being admitted to the bar (1744) his success was immediate. He served in the Virginia house of burgesses from 1752 until the organization of the state government in 1776, was the recognized leader of the Conservative Whigs, and took a leading part in opposing the British government. He was a member of the Virginia committee of correspondence in 1773, in 1774 was president of the Virginia provincial convention, and a member of the first

Continental Congress. In 1776, as president of the provincial convention, which adopted a state constitution for Virginia, he drew up the instructions to the Virginia members of Congress directing them to advocate the independence of the American colonies. In the same year he became president of the Virginia committee of safety, and in October was chosen the first speaker of the house of delegates. With Jefferson and Chancellor George Wythe he drew up a new law code for Virginia. He was president of the court of chancery in 1777–1788, and from 1779 until his death was president of the Virginia court of appeals. He was an enthusiastic advocate of the Federal constitution, and in 1788 exerted strong influence to secure its ratification by his native state. He was a leader of the Federalist party in Virginia until his death at Richmond, Va., on the 23rd of October 1803.

PENDLETON, GEORGE HUNT (1825–1889), American lawyer and legislator, was born in Cincinnati, Ohio, on the 25th of July 1825. He was educated at the university of Heidelberg, studied law, was admitted to the bar, and began to practise at Cincinnati. He was a member of the Ohio senate in 1854 and 1855, and from 1857 to 1865 was a Democratic member of the national House of Representatives, in which he opposed the war policy of Lincoln. In 1864 he was the Democratic candidate for vice-president. After leaving Congress he became one of the earliest champions of the "Ohio idea" (which he is said to have originated), demanding that the government should pay the principal of its 5–20-year 6 % bonds in the "greenback" currency instead of in coin. The agricultural classes of the West regarded this as a means of relief, and Pendleton became their recognized leader and a candidate for the Democratic nomination to the presidency in 1868, but he failed to receive the requisite two-thirds majority. In 1869 he was the Democratic candidate for governor of Ohio, but was defeated by Rutherford B. Hayes. For the next ten years he devoted himself to the practice of law and to the supervision of the Kentucky Railroad Company, of which he had become president in 1869. From 1879 to 1885 he was a Democratic member of the United States Senate, and introduced the so-called Pendleton Act of 1883 for reforming the civil service, hostility to which lost him his seat in 1885. He was minister to Germany from 1885 to the summer of 1889, and died at Brussels on the 24th of November 1889.

PENELOPE, in Greek legend, wife of Odysseus, daughter of Icarius and the nymph Periboea. During the long absence of her husband after the fall of Troy many chieftains of Ithaca and the islands round about became her suitors; and, to rid herself of the importunities of the wooers, she bade them wait till she had woven a winding-sheet for old Laërtes, the father of Odysseus. But every night she undid the piece which she had woven by day. This she did for three years, till her maids revealed the secret. She was relieved by the arrival of Odysseus, who returned after an absence of twenty years, and slew the wooers. The character of Penelope is less favourable in late writers than in the Homeric story. During her husband's absence she is said to have become the mother of Pan by Hermes, and Odysseus, on his return, repudiated her as unfaithful (Herodotus ii. 145 and schol.). She thereupon withdrew to Sparta and thence to Mantineia, where she died and where her tomb was shown. According to another account she married Telegonus the son of Odysseus and Circe, after he had killed his father, and dwelt with him in the island of Aeala or in the Islands of the Blest (Hyginus, *Feb.* 127).

PENGELLY, WILLIAM (1812–1894), English geologist and anthropologist, was born at East Looe in Cornwall on the 12th of January 1812, the son of the captain of a small coasting vessel. He began life as a sailor, after an elementary education in his native village, but in 1828 he abandoned a seafaring life. He had developed a passion for learning, and about 1836 he removed to Torquay and started a school; in 1846 he became a private tutor in mathematics and natural science. Geology had in early years attracted his attention, but it was not until he was about 30 years of age that he began seriously to cultivate the study. In 1837 he was instrumental in the reorganization of the Torquay Mechanics' Institute, in 1844 mainly owing to his energy the Torquay Natural History Society was founded, and in 1862 he assisted in founding the Devonshire Association for the Advancement of Literature, Science and Art. Meanwhile he had been occupied in collecting fossils from many parts of Devon and Cornwall, and in 1860 the Baroness Burdett-Coutts acquired and presented them to the Oxford Museum, where they form "The Pengelly Collection." Through the generosity of the same lady he was called upon to examine the lignites and clays of Bovey Tracey, in conjunction with Dr Oswald Heer, who undertook the determination of the plant-remains. Their report was published by the Royal Society (1862), and Pengelly was elected F.R.S. in 1863. He aided in the investigations of the Brixham bone-cavern from the date of its discovery in 1858, the full report being issued in 1873; and he was the main explorer of Kent's Hole, Torquay, and from 1864 for more than fifteen years he laboured with unflagging energy in examining and recording the exact position of the numerous organic remains that were disinterred during a systematic investigation of this cave, carried on with the aid of grants from the British Association. He first attended the British Association at the Cheltenham meeting in 1856, and was present at subsequent meetings (except that at Montreal in 1884) until 1889. His observations assisted in establishing the important fact of the contemporaneity of Palaeolithic man with various Pleistocene mammalia, such as the mammoth, cave-bear, cave-lion, &c. He was awarded the Lyell medal by the Geological Society of London in 1886. He died at Torquay on the 16th of March 1894.

See *Memoir of William Pengelly*, edited by his daughter Hester Pengelly, with a summary of his scientific work by the Rev. Professor T. G. Bonney (1897).

PENGUIN, the name of a flightless sea-bird,[1] but, so far as is known, first given to one inhabiting the seas of Newfoundland as in Hore's "Voyage to Cape Breton," 1536 (Hakluyt, *Researches*, iii. 168–170), which subsequently became known as the great auk or garefowl (*q.v.*); though the French equivalent *Pingouin*[2] preserves its old application, the word penguin is by English ornithologists always used for certain birds inhabiting the Southern Ocean, called by the French *Manchots*, the *Spheniscidae* of ornithologists. For a long while their position was very much misunderstood, some systematists having placed them with the *Alcidae* or Auks, to which they bear only a relationship of analogy, as indeed had been perceived by a few ornithologists, who recognized in the penguins a very distinct order, *Impennes*. L. Stejneger (*Standard Nat. Hist.* vol. iv., Boston, 1885) gave the *Impennes* independent rank equivalent to the rest of Carinate birds; M. A. Menzbier (*Vergl. Osteol. d. Penguine*, Moscow, 1887) took a similar view; M. Fürbringer was first to show their relation to *Procellariiformes*, and this view is now generally accepted.

[1] Of the three derivations assigned to this name, the first is by Drayton in 1613 (*Polyolbion*, Song 9), where it is said to be the Welsh *pen gwyn*, or "white head"; the second, which seems to meet with Littré's approval, deduces it from the Latin *pinguis* (fat), which idea has given origin to the German name, *Fettgänse*, for these birds; the third supposes it to be a corruption of "pin-wing" (*Ann. Nat. History*, 4th series, vol. iv. p. 133), meaning a bird that has undergone the operation of pinioning or, as in one part at least of England it is commonly called, "pin-winging." The first hypothesis has been supported on the ground that Breton sailors speaking a language closely allied to Welsh were acquainted with the great auk, and that the conspicuous white patches on the head of that bird justified the name "white head." To the second hypothesis Skeat (*Dictionary*, p. 433) objects that it "will not account for the suffix *-in*, and is therefore wrong; besides which the 'Dutchmen' [who were asserted to be the authors of the name] turn out to be Sir Francis Drake" and his men. In support of the third hypothesis Mr Reeks wrote (*Zoologist*, 2nd series, p. 1854) that the people in Newfoundland who used to meet with this bird always pronounced its name "pin wing." Skeat's inquiry (*loc. cit.*), whether the name may not after all be South American, is to be answered in the negative, since, so far as evidence goes, it was given to the North American bird before the South American was known in Europe.

[2] *Gorfou* has also been used by some French writers, being a corruption of *Geirfugl* or Garefowl.

There is a total want of quills in their wings, which are incapable of flexure, though they move freely at the shoulder-joint, and some at least of the species occasionally make use of them for progressing on land. In the water they are most efficient paddles. The plumage, which clothes the whole body, generally consists of small scale-like feathers, many of them consisting only of a simple shaft without the development of barbs; but several of the species have the head decorated with long cirrhous tufts, and in some the tail-quills, which are very numerous, are also long.[1] In standing these birds preserve an upright position, sometimes resting on the "tarsus"[2] alone, but in walking or running this is kept nearly vertical, and their weight is supported by the toes alone.

The most northerly limit of the penguins' range in the Atlantic is Tristan d'Acunha, and in the Indian Ocean Amsterdam Island, but they also occur off the Cape of Good Hope and along the coast of Australia, as well as on the south and east of New Zealand, while in the Pacific one species at least extends along the west coast of South America and to the Galapagos; but north of the equator none are found. In the breeding season they resort to the most desolate lands in higher southern latitudes, and indeed have been met with as far to the southward as navigators have penetrated. Possibly the Falkland Islands are richest in species, though, as individuals, they are not nearly so numerous there as in many other places. The food of penguins consists of crustaceans, cephalopods and other molluscs, varied by fish and vegetable matter. The birds form immense breeding colonies, known as "rookeries." The nest of grass, leaves, or where vegetation is scanty of stones or rubbish, is placed on the ground or in holes. Two chalky white or greenish eggs are laid. The young penguins, clad in thick down, are born blind and are fed by the parents for an unusually long time before taking to the water. Penguins bite savagely when molested, but are easily trained and display considerable intelligence.

King-Penguin (*Aptenodytes pennanti*).

The *Spheniscidae* have been divided into at least eight genera, but three, or at most four, seem to be all that are needed, and three can be well distinguished, as pointed out by E. Coues in *Proc. Acad. of Nat. Sci. of Philadelphia, 1872* (pp. 170–212), by anatomical as well as by external characters. They are: (1) *Aptenodytes*, easily recognized by its long and thin bill, slightly decurved, from which *Pygoscelis*, as M. Watson has shown, is hardly distinguishable; (2) *Eudyptes*, in which the bill is much shorter and rather broad; and (3) *Spheniscus*, in which the shortish bill is compressed and the maxilla ends in a conspicuous hook. *Aptenodytes* contains the largest species, among them those known as the "Emperor" and "King" penguins *A. patagonica* and *A. longirostris*. Three others belong also to this genus, if *Pygoscelis* be not recognized, but they seem not to require any particular remark. *Eudyptes*, containing the crested penguins, known to sailors as "Rock-hoppers" or "Macaronis," would appear to have five species, and *Spheniscus* four, among which *S. mendiculus*, which occurs in the Galapagos, and therefore has the most northerly range of the whole group, alone needs notice here. (A. N.)

The generic and specific distribution of the penguins is the subject of an excellent essay by Alphonse Milne-Edwards in the *Annales des sciences naturelles* for 1880 (vol. ix. art. 9, pp. 23–81); see also the Records of the Antarctic Expedition, 1901–1904.

[1] The pterylographical characters of the penguins are well described by A. Hyatt (*Proc. Boston Soc. Nat. History*, 1871). A. D. Bartlett has observed (*Proc. Zool. Soc.*, 1879, pp. 6–9) that, instead of moulting in the way that birds ordinarily do, penguins, at least in passing from the immature to the adult dress, cast off the short scale-like feathers from their wings in a manner that he compares to "the shedding of the skin in a serpent."

[2] The three metatarsals in the penguins are not, as in other birds, united for the whole of their length, but only at the extremities, thus preserving a portion of their originally distinct existence, a fact probably attributable to arrest of development, since the researches of C. Gegenbaur show that the embryos of all birds, so far as is known, possess these bones in an independent condition.

PENHALLOW, SAMUEL (1665–1726), American colonist and historian, was born at St Mabon, Cornwall, England, on the 2nd of July 1665. From 1683 to 1686 he attended a school at Newington Green (near London) conducted by the Rev. Charles Morton (1627–1698), a dissenting clergyman, with whom he emigrated to Massachusetts in 1686. He was commissioned by the Society for the Propagation of the Gospel in New England to study the Indian languages and to preach to the Indians; but he was soon diverted from this work. Removing to Portsmouth, New Hampshire, he there married a daughter of John Cutt (1625–1681), president of the province of New Hampshire in 1679–1680, a successful merchant and mill-owner, and thus came into possession of considerable property (including much of the present site of Portsmouth). In 1700 he was speaker of the Assembly and in 1702 became a member of the provincial council, but was suspended by Lieut.-Governor George Vaughan (1676–1724). Penhallow, however, was sustained by Governor Samuel Shute (1662–1742), and Vaughan was removed from office in 1716. In 1714 Penhallow was appointed a justice of the superior court of judicature, and from 1717 until his death was chief justice of that court; and he also served as treasurer of the province in 1699–1726, and as secretary of the province in 1714–1726. He died at Portsmouth on the 2nd of December 1726. He wrote a valuable *History of the War of New England with the Eastern Indians, or a Narrative of their Continued Perfidy and Cruelty* (1726; reprinted in the *Collections* of the New Hampshire Historical Society, vol. i., 1824, and again at Cincinnati in 1859), which covers the period from 1703 to 1726, and is a standard contemporary authority.

PENINGTON, SIR ISAAC (*c.* 1587–1661), lord mayor of London, eldest son of Robert Penington, a London fishmonger, was born probably in 1587. His father besides his London business had landed estates in Norfolk and Suffolk, which Isaac inherited in addition to a property in Buckinghamshire which he himself purchased. In 1638 Isaac became an alderman and high sheriff of London. In 1640 he was elected to the House of Commons as member for the city of London, and immediately took a prominent place among the Puritan party. In 1642 he was elected lord mayor of London, but retained his seat in parliament by special leave of the Commons; and he was elected lord mayor for a second term in the following year, continuing while in office to raise large sums of money for the opposition to the Court party. From 1642 to 1645 he was lieutenant of the Tower, in which capacity he was present at the execution of Laud; but, though one of the commissioners for the trial of Charles I., he did not sign the death warrant. After the king's death Penington served on Cromwell's council of state, and on several committees of government. His services were rewarded by considerable grants of land, and a

knighthood conferred in 1649. He was tried and convicted of treason at the Restoration, and died while a prisoner in the Tower on the 17th of December 1661. He was twice married, and had six children by his first wife, several of whom became Quakers.

Isaac Penington (1616–1679), Sir Isaac's eldest son, was one of the most notable of the 17th-century Quakers. He was early troubled by religious perplexities, which found expression in many voluminous writings. No less than eleven religious works, besides a political treatise in defence of democratic principles, were published by him in eight years. He belonged for a time to the sect of the Independents; but about 1657, influenced probably by the preaching of George Fox, whom he heard in Bedfordshire, Penington and his wife joined the Society of Friends. His wife was daughter and heiress of Sir John Proude, and widow of Sir William Springett, so that the worldly position of the couple made them a valuable acquisition to the Quakers. Isaac Penington was himself a man of very considerable gifts and sweetness of character. In 1661 he was imprisoned for refusing to take the oath of allegiance, and on several subsequent occasions he passed long periods in Reading and Aylesbury gaols. He died on the 8th of October 1679; his wife, who wrote an account of his imprisonments, survived till 1682. In 1681 Penington's writings were published in a collected edition, and several later editions were issued before the end of the 18th century. His son John Penington (1655–1710) defended his father's memory against attack, and published some controversial tracts against George Keith. Edward Penington (1667–1711), another of Isaac Penington's sons, emigrated to Pennsylvania, where he founded a family. Isaac Penington's stepdaughter, Gulielma Springett, married William Penn.

PENINSULA (Lat. *paeninsula*, from *paene*, almost, and *insula*, an island), in physical geography, a piece of land nearly surrounded by water. In its original sense it connotes attachment to a larger land-mass by a neck of land (isthmus) narrower than the peninsula itself, but it is often extended to apply to any long promontory, the coast-line of which is markedly longer than the landward boundary.

PENINSULAR WAR (1808–14). This important war, the conduct and result of which greatly enhanced the prestige of British arms, had for its main object the freedom of the Peninsula of Spain and Portugal from the domination of Napoleon; and hence it derives its name, though it terminated upon the soil of France.

Nelson having destroyed the French fleet at Trafalgar, Napoleon feared the possibility of a British army being landed on the Peninsular coasts, whence in conjunction with Portuguese and Spanish forces it might attack France from the south. He therefore called upon Portugal, in August 1807, to comply with his Berlin decree of the 21st of November 1806, under which continental nations were to close their ports to British subjects, and have no communication with Great Britain. At the same time he persuaded the weak king of Spain (Charles IV.) and his corrupt minister Godoy to permit a French army to pass through Spain towards Portugal; while under a secret treaty signed at Fontainebleau on the 27th of October 1807 Spanish troops were to support the French. Portugal was to be subsequently divided between Spain and France, and a new principality of the Algarve was to be carved out for Godoy. Portugal remonstrated against Napoleon's demands, and a French corps (30,000) under General Junot was instantly despatched to Lisbon. Upon its approach the prince regent fled, and the country was occupied by Junot, most of the Portuguese troops being disbanded or sent abroad. Napoleon induced the king of Spain to allow French troops to occupy the country and to send the flower of the Spanish forces (15,000) under the marquis of Romana[1] to assist the French on the Baltic. Then Dupont de l'Étang (25,000) was ordered to cross the Bidassoa on the 22nd of November 1807; and by the 8th of January 1808 he had reached Burgos and Valladolid. Marshal Moncey with a corps occupied Biscay and Navarre; Duhesme with a division entered Catalonia; and a little later Bessières with another corps had been brought up. There were now about 100,000 French soldiers in Spain, and Murat, grand duke of Berg, as "lieutenant for the emperor," entered Madrid. During February and March 1808 the frontier fortresses of Pampeluna, St Sebastian, Barcelona and Figueras were treacherously occupied and Spain lay at the feet of Napoleon. The Spanish people, in an outburst of fury against the king and Godoy, forced the former to abdicate in favour of his son Ferdinand; but the inhabitants of Madrid having (May 2, 1808) risen against the French, Napoleon refused to recognize Ferdinand; both he and the king were compelled to renounce their rights to the throne, and a mercenary council of regency having been induced to desire the French emperor to make his brother, Joseph Bonaparte, king, he acceded to their request.[2]

The mask was now completely thrown off, and Spain and Portugal rose against the French. Provincial "juntas" (committees of government) were organized; appeals for assistance made to the British government, which granted arms, money and supplies, and it was resolved to despatch a British force to the Peninsula. Before it landed, the French under Dupont, Moncey and Marshal Bessières (75,000) had occupied parts of Biscay, Navarre, Aragon and the Castiles, holding Madrid and Toledo, while General Duhesme (14,000) was in Catalonia. Moncey (7000) had marched towards the city of Valencia, but been repulsed in attempting to storm it (June 28); Bessières had defeated the Spanish general Joachim Blake at Medina de Rio Seco (June 14, 1808) and Dupont (13,000) had been detached (May 24) from Madrid to reduce Seville and Cadiz in Andalusia. Spanish levies, numbering nearly 100,000 regulars and militia, brave and enthusiastic, but without organization, sufficient training, or a commander-in-chief, had collected together; 30,000 being in Andalusia, a similar number in Galicia, and others in Valencia and Estremadura, but few in the central portion of Spain.

At this juncture Dupont, moving upon Cadiz, met with a reverse which greatly influenced the course of the Peninsular War. On the 7th of June 1808 he had sacked Cordova; but while he was laden with its spoils the Spanish general Castaños with the army of Andalusia (30,000), and also a large body of armed peasantry, approached. Falling back to Andujar, where he was reinforced to 22,000 strong, Dupont detached a force to hold the mountain passes in his rear, whereupon the Spaniards interposed between the detachment and the main body and seized Baylen. Failing to dislodge them, and surrounded by hostile troops and an infuriated peasantry, Dupont capitulated with over 20,000 men. This victory, together with the intrepid defence of Saragossa by the Spanish general José Palafox (June 15 to August 13, 1808), temporarily paralysed the French and created unbounded enthusiasm in Spain. Duhesme, having failed to take Gerona, was blockaded in Barcelona, Joseph fled from Madrid (Aug. 1, 1808), and the French forces closed to their rear to defend their communications with France. The British troops were directed towards Lisbon and Cadiz, in order to secure these harbours, to prevent the subjugation of Andalusia, and to operate up the basins of the Guadiana, Tagus and Douro into Spain. The British force consisted of 9000 men from Cork, under Sir Arthur Wellesley—at first in chief command; 5000 from Gibraltar, under General (Sir Brent) Spencer; and 10,000 under Sir John Moore coming from Sweden; Wellesley and Moore being directed towards Portugal, and Spencer to Cadiz. On the 1st of August 1808

Battle of Baylen, July 19, 1808.

[1] They subsequently escaped from Jutland, on British vessels, and reached Santander in October 1808.

[2] The king, the queen and Godoy were eventually removed to Rome, and Ferdinand to Valençay in France.

Wellesley began to land his troops, unopposed, near Figueira da Foz at the mouth of the Mondego; and the Spanish victory of Baylen having relieved Cadiz from danger, Spencer now joined him, and, without waiting for Moore the army, under 15,000 in all (which included some Portuguese)[1] with 18 guns, advanced towards Lisbon.

Campaign in Portugal, 1808.—The first skirmish took place at Obidos on the 15th of August 1808, against Delaborde's division (5000 men with 5 guns), which fell back to Roleia (Roriça or Roliça). A battle took place here (Aug. 17) in which Sir Arthur Wellesley attacked and drove him from two successive positions. The allied loss was about 500: the French 600 and three guns.[1] On the 20th of August the Allies, strengthened by the arrival of two more brigades (4000 men), occupied some heights north of Vimiera (Vimeira or Vimeiro) where the roads branch off to Torres Vedras and Mafra. Wellesley meant to turn the defile of Torres Vedras by Mafra at once if possible; but on this night Sir Harry Burrard, his senior, arrived off Vimiera, and though he did not land, gave instructions to wait for Sir John Moore. On the 21st of August the Allies were attacked by Junot at Vimiera, who, leaving a force at Lisbon, had come up to reinforce Delaborde. In this battle the Allies numbered about 18,000 with 18 guns, French nearly 14,000, with 20 guns. Junot, believing the allied left to be weakly held, attacked it without reconnoitring, but Wellesley's regiments, marched thither behind the heights, sprang up in line; and under their volleys and bayonet charge, supported by artillery fire, Junot's deep columns were driven off the direct road to Lisbon. The losses were: Allies about 800, French 2000 and 13 guns. It was now again Wellesley's wish to advance and seize Torres Vedras; but Sir Hew Dalrymple, having at this moment assumed command, decided otherwise. On the 2nd of August Junot, knowing of the approach of Moore with reinforcements, and afraid of a revolt in Lisbon, opened negotiations, which resulted in the Convention of Cintra[2] (Aug. 30, 1808), under which the French evacuated Portugal, on condition that they were sent with their artillery and arms to France. Thus this campaign had been rapidly brought to a satisfactory conclusion; and Sir Arthur Wellesley had already given proof of his exceptional gifts as a leader. In England however a cry was raised that Junot should have been forced to an absolutely unconditional surrender; and Sir Arthur Wellesley, Sir Hew Dalrymple and Sir Harry Burrard[3] were brought before a court of inquiry in London. This acquitted them of blame, and Sir John Moore in the meantime after the departure of Dalrymple (Oct. 6, 1808) had assumed command of the allied army in Portugal, now about 32,000 strong.

Battle of Vimiera, August 21, 1808.

Moore's Campaign in Spain, 1808–9.—The British government notified to Sir John Moore that some 10,000 men were to be sent to Corunna under Sir David Baird; that he, with 20,000, was to join him, and then both act in concert with the Spanish armies. As the conduct of this campaign was largely influenced by the operations of the Spanish forces, it is necessary to mention their positions, and also the fact that greater reliance had been placed, both in England and Spain, upon them than future events justified. On the 26th of October 1808, when Moore's troops had left Lisbon to join Baird, the French still held a defensive position behind the Ebro; Bessières being in the basin of Vitoria, Marshal Ney north-west of Logroño, and Moncey covering Pampeluna, and near Sanguessa. With the garrisons of Biscay, Navarre, and a reserve at Bayonne, their strength was about 75,000 men. Palafox (20,000) was near Saragossa and observing Sanguessa; Castaños with the victors of Baylen (34,000) west and south of Tudela and near Logroño; Blake (32,000) east of Reynosa, having captured Bilbao; Count de Belvedere (11,000) near Burgos; reserves (57,000) were assembling about Segovia, Talavera and Cordova; Catalonia was held by 23,000, and Madrid had been reoccupied.

Moore had to decide whether to join Baird by sea or land. To do so by sea at this season was to risk delay, while in moving by land he would have the Spanish armies between him and the French. For these reasons he marched by land; and as the roads north of the Tagus were deemed impassable for guns, while transport and supplies for a large force were also difficult to procure, he sent Sir John Hope, with the artillery, cavalry and reserve ammunition column, south of the river, through Badajoz to Almaraz, to move thence through Talavera, Madrid and the Escurial Pass, involving a considerable détour; while he himself with the infantry, marching by successive divisions, took the shorter roads north of the Tagus through Coimbra and Almeida, and also by Alcantara and Coria to Ciudad Rodrigo and Salamanca. Baird was to move south through Galicia to meet him, and the army was to concentrate at Valladolid, Burgos, or whatever point might seem later on to be best. But as Moore was moving forward, the whole situation in Spain changed. Napoleon's forces, now increased to some 200,000 men present and more following, were assuming the offensive, and he himself on the 30th of October—had left Paris to place himself at their head. Before them the Spaniards were routed in every direction: Castaños was defeated near Logroño (Oct. 27); Castaños and Palafox at Tudela (Nov. 23); Blake at Zornoza (Oct. 29), Espinosa (Nov. 11) and Reynosa (Nov. 13); and Belvedere at Gamonal, near Burgos (Nov. 10). Thus when Moore reached Salamanca (Nov. 28) Baird was at Astorga; Hope at the Escurial Pass; Napoleon himself at Aranda; and French troops at Valladolid, Arevalo and Segovia; so that the French were nearer than either Baird or Hope to Moore at Salamanca. Moore was ignorant of their exact position and strength, but he knew that Valladolid had been occupied, and so his first orders were that Baird should fall back to Galicia and Hope to Portugal. But these were soon changed, and he now took the important resolution of striking a blow for Spain, and for the defenders of Madrid, by attacking Napoleon's communications with France. Hope having joined him through Avila, and magazines having been formed at Benavente, Astorga and Lugo, in case of retreat in that direction, he moved forward, and on the 13th of December approached the Douro, at and near Rueda east of Toro. Here he learnt that Madrid had fallen to Napoleon (Dec. 3) after he had by a brilliant charge of the Polish lancers and chasseurs of the Guard forced the Somosierra Pass (Nov. 30) and in another action stormed the Retiro commanding Madrid itself (Dec. 3); that the French were pressing on towards Lisbon and Andalusia; that Napoleon was unaware of his vicinity, and that Soult's corps, isolated on the Carrion River, had been ordered towards Benavente. He then finally decided to attack Soult (intending subsequently to fall back through Galicia) and ordered up transports from Lisbon to Corunna and Vigo; thus changing his base from Portugal to the north-west of Spain; Blake's Spanish army, now rallying under the marquis de la Romaña near Leon, was to co-operate, but was able to give little effective aid.

On the 20th of December Baird joined Moore near Mayorga, and a brilliant cavalry combat now took place at Sahagun, in which the British hussar brigade distinguished itself. But on the 23rd of December, when Moore was at Sahagun and about to attack Soult, he learnt that overwhelming French forces were hastening towards him, so withdrew across the Esla, near Benavente (Dec. 28), destroying the bridge there. Napoleon, directly he realized Moore's proximity, had ordered Soult to Astorga to cut him off from Galicia; recalled his other troops from their march towards Lisbon and Andalusia, and, with 50,000 men and 150 guns, had left Madrid himself (Dec. 22). He traversed over 100 m. in less than five days across the snow-covered Escurial Pass, reaching Tordesillas on the Douro on the 26th of December. Hence he wrote to Soult, "If the English

[1] In this account of the war the losses and numbers engaged in different battles are given approximately only; and the former include killed, wounded and missing. Historians differ much on these matters.

[2] It was not, however, signed at Cintra, but at Lisbon, and was mainly negotiated near Torres Vedras.

[3] The two latter were recalled from the Peninsula; Sir Arthur Wellesley had proceeded to London upon leave, and had only signed the armistice with Junot, not the convention itself.

pass to-day in their position (which he believed to be Sahagun) they are lost." But Moore had passed Astorga by the 31st of December, where Napoleon arrived on the 1st of January 1809. Thence he turned back, with a large portion of his army towards France, leaving Soult with over 40,000 men to follow Moore.

On the "Retreat to Corunna" fatigue, wet and bitter cold, combined with the sense of an enforced retreat, shook the discipline of Moore's army; but he reached Corunna on the 11th of January 1809, where he took up a position across the road from Lugo, with his left on the river Mero. On the 14th of January the transports arrived; and on the 16th Soult attacked.

Battle of Corunna, January 16, 1809.

In this battle the French numbered about 20,000 with 40 guns; the British 15,000 with 9 very light guns. Soult failed to dislodge the British, and Moore was about to deliver a counter-attack when he himself fell mortally wounded. Baird was also wounded, and as night was approaching, Hope suspended the advance, and subsequently embarked the army, with scarcely any further loss. The British casualties were about 1000, the French 2000. When the troops landed in England, half clothed and half shod, their leader's conduct of the campaign was at first blamed, but his reputation as a general rests solidly upon these facts, that when Napoleon in person, having nearly 300,000 men in Spain, had stretched forth his hand to seize Portugal and Andalusia, Moore with 30,000, forced him to withdraw it, and follow him to Corunna, escaping at the same time from his grasp. Certainly a notable achievement.

Campaign in Portugal and Spain, 1809.—On the 22nd of April 1809 Sir Arthur Wellesley reached Lisbon. By this time, French armies, to a great extent controlled by Napoleon from a distance, had advanced—Soult from Galicia to capture Oporto and Lisbon (with General Lapisse from Salamanca moving on his left towards Abrantes) and Marshal Victor, still farther to the left, with a siege train to take Badajoz, Merida and subsequently Cadiz. Soult (over 20,000), leaving Ney in Galicia, had taken and sacked Oporto (March 29, 1809); but the Portuguese having closed upon his rear and occupied Vigo, he halted, detaching a force to Amarante to keep open the road to Braganza and asked for reinforcements. Victor had crossed the Tagus, and defeated Cuesta at Medellin (March 28, 1809); but, surrounded by insurgents, he also had halted; Lapisse had joined him, and together they were near Merida, 30,000 strong. On the allied side the British (25,000), including some German auxiliaries, were about Leiria: the Portuguese regular troops (16,000) near Thomar; and some thousands of Portuguese militia were observing Soult in the north of Portugal, a body under Silveira being at Amarante, which Soult was now approaching. Much progress had been made in the organization and training of the Portuguese levies; Major-General William Carr Beresford, with the rank of marshal, was placed at their head. Of the Spaniards, Palafox, after his defeat at Tudela had most gallantly defended Saragossa a second time (Dec. 20, 1808–Feb. 20, 1809); the Catalonians, after reverses at Molins de Rey (Dec. 21, 1808) and at Valls (Feb. 25, 1809) had taken refuge in Tarragona; and Rosas had fallen (Dec. 5, 1808) to the French general Gouvion St Cyr who, having relieved Barcelona, was besieging Gerona. Romaña's force was now near Orense in Galicia. A supreme junta had been formed which could nominally assemble about 100,000 men, but jealousy among its members was rife, and they still declined to appoint any commander-in-chief.

On the 5th of May 1809, Wellesley moved towards the river Douro, having detached Beresford to seize Amarante, from which the French had now driven Silveira. Soult

Passage of the Douro, May 12, 1809.

expected the passage of the Douro to be attempted, near its mouth, with fishing craft; but Wellesley, by a daring surprise, crossed (May 12) close above Oporto, and also by a ford higher up. After some fighting Oporto was taken, and Soult driven back. The Portuguese being in his rear, and Wellesley closing with him, the only good road of retreat available lay through Amarante, but he now learned that Beresford had taken this important point from Silveira; so he was then compelled, abandoning his guns and much baggage, to escape, with a loss of some 5000 men, over the mountains of the Sierra Catalina to Salamonde, and thence to Orense.

During the above operations, Victor, with Lapisse, had forced the passage of the Tagus at Alcantara but, on Wellesley returning to Abrantes, he retired. News having been received that Napoleon had suffered a serious check at the battle of Aspern, near Vienna (May 22, 1809), Wellesley next determined—leaving Beresford (20,000) near Ciudad Rodrigo—to move with 22,000 men, in conjunction with Cuesta's Spanish army (40,000) towards Madrid against Victor, who, with 25,000, supported by King Joseph (50,000) covering the capital, was near Talavera. Sir Robert Wilson with 4000 Portuguese from Salamanca, and a Spanish force under Venegas (25,000) from Carolina, were to co-operate and occupy Joseph, by closing upon Madrid. Cuesta, during the advance up the valley of the Tagus, was to occupy the pass of Baños on the left flank; the Spanish authorities were to supply provisions, and Venegas was to be at Arganda, near Madrid, by the 22nd or 23rd of July; but none of these arrangements were duly carried out, and it was on this that the remainder of the campaign turned. Writing to Soult from Austria, Napoleon had placed the corps of Ney and Mortier under his orders, and said: "Wellesley will most likely advance by the Tagus against Madrid; in that case, pass the mountains, fall on his flank and rear, and crush him."

By the 20th of July Cuesta had joined Wellesley at Oropesa; and both then moved forward to Talavera, Victor falling back before them: but Cuesta, irritable and jealous, would not work cordially with Wellesley; Venegas—counter-ordered it is said by the Spanish junta—did not go to Arganda, and Wilson, though he advanced close to Madrid, was forced to retire, so that Joseph joined Victor, and the united force attacked the Allies at Talavera de la Reina on the Tagus. The battle lasted for two days, and ended in the defeat of the French, who fell back towards Madrid.[1] Owing to want of supplies, the British had fought in a half-starved condition; and Wellesley now learnt to his surprise that Soult had passed the mountains and was in his rear. Having turned about, he was on the march to attack him, when he heard (Aug. 23) that not Soult's corps alone, but three French corps, had come through the pass of Baños without opposition; that Soult himself was at Naval Moral, between him and the bridge of Almaraz on the Tagus, and that Cuesta was retreating from Talavera. Wellesley's force was now in a dangerous position: but by withdrawing at once across the Tagus at Arzobispo, he reached Jaraicejo and Almaraz (by the south bank) blowing up the bridge at Almaraz, and thence moved, through Merida, northwards to the banks of the Agueda, commencing to fortify the country around Lisbon.

Battle of Talavera, July 27, 28, 1809.

Elsewhere in the Peninsula during this year, Blake, now in Catalonia, after routing Suchet at Alcaniz (May 23, 1809), was defeated by him at Maria (June 15) and at Belchite (June 18); Venegas, by King Joseph and Sébastiani, at Almonacid on the 11th of August; Del Parque (20,000), after a previous victory near Salamanca (Oct. 18), was overthrown at Alba de Tormes by General Marchand (Nov. 28); the old forces of Venegas and Cuesta (50,000), now united under Areizaga, were decisively routed by King Joseph at Ocaña (Nov. 19); and Gerona, after a gallant defence, had surrendered to Augereau (Dec. 10).

Sir Arthur Wellesley was for this campaign created Baron Douro and Viscount Wellington. He was made captain-general by Spain, and marshal-general by Portugal. But his experience after Talavera had been akin to that of Moore; his expectations from the Spaniards had not been realized; he had been almost intercepted by the French, and he had narrowly escaped from a critical position. Henceforth he resisted all proposals for joint operations, on any large scale, with Spanish armies not under his own direct command.

[1] After the battle the Light Division, under Robert Craufurd, joined Wellesley. In the endeavour to reach the field in time it had covered, in heavy marching order, over 50 m. in 26 hours, in hot July weather.

Campaign in Portugal, 1810.—Napoleon, having avenged Aspern by the victory of Wagram (July 6, 1809), despatched to Spain large reinforcements destined to increase his army there to about 370,000 men. Marshal Masséna with 120,000, including the corps of Ney, Junot, Reynier and some of the Imperial Guard, was to operate from Salamanca against Portugal; but first Soult, appointed major-general of the army in Spain (equivalent to chief of the staff), was, with the corps of Victor, Mortier and Sébastiani (70,000), to reduce Andalusia. Soult (Jan. 31, 1810) occupied Seville and escaping thence to Cadiz, the Supreme Junta resigned its powers to a regency of five members (Feb. 2, 1810). Cadiz was invested by Victor's corps (Feb. 4), and then Soult halted, waiting for Masséna, who arrived at Valladolid on the 15th of May.

In England a party in parliament were urging the withdrawal of the British troops, and any reverse to the allied arms would have strengthened its hands. Wellington's policy was thus cautious and defensive, and he had already commenced the since famous lines of Torres Vedras round Lisbon. In June 1810 his headquarters were at Celorico. With about 35,000 British, 30,000 Portuguese regular troops and 30,000 Portuguese militia, he watched the roads leading into Portugal past Ciudad Rodrigo to the north, and Badajoz to the south of the Tagus, as also the line of the Douro and the country between the Elga and the Ponsul.

Battle of Busaco, September 27, 1810.

Soult having been instructed to co-operate by taking Badajoz and Elvas, Masséna, early in June 1810, moved forward, and Ciudad Rodrigo surrendered to him (June 10). Next pushing back a British force under Craufurd, he invested Almeida, taking it on the 27th of August. Then calling up Reynier, who during this had moved on his left towards Alcantara, he marched down the right bank of the Mondego, and entered Viseu (Sept. 21). Wellington fell back before him down the left bank, ordering up Rowland Hill's force from the Badajoz road, the peasantry having been previously called upon to destroy their crops and retire within the lines of Torres Vedras. A little north of Coimbra, the road which Masséna followed crossed the Sierra de Bussaco (Busaco), a very strong position where Wellington resolved to offer him battle. Masséna, superior in numbers and over-confident, made a direct attack upon the heights on the 27th of September 1810: his strength being about 60,000, while that of the Allies was about 50,000, of whom nearly half were Portuguese. After a stern conflict the French were repulsed, the loss being five generals and nearly 5000 men, while the Allies lost about 1300. The next day Masséna turned the Sierra by the Boyalva Pass and Sardao, which latter place, owing to an error, had not been occupied by the Portuguese, and Wellington then retreated by Coimbra and Leiria to the lines, which he entered on the 11th of October, having within them fully 100,000 able-bodied men.

Lines of Torres Vedras 1810-11.

The celebrated "Lines of Torres Vedras" were defensive works designed to resist any army which Napoleon could send against them. They consisted of three great lines, strengthened by about 150 redoubts, and earthworks of various descriptions, mounting some 600 cannon; the outer line, nearly 30 m. long, stretching over heights north of Lisbon, from the Tagus to the sea. As Masséna advanced, the Portuguese closing upon his rear retook Coimbra (Oct. 7), and when he neared the lines, astounded at their strength, he sent General Foy to the emperor to ask for reinforcements. After an effort, defeated by Hill, to cross the Tagus, he withdrew (Nov. 15) to Santarem. This practically closed Wellington's operations for the year 1810, his policy now being not to lose men in battle, but to reduce Masséna by hunger and distress.

In other parts of Spain, Augereau had taken Hostalrich (May 10); captured Lerida (May 14); Mequinenza (June 8); and invested Tortosa (Dec. 15). The Spanish levies had been unable to contribute much aid to the Allies; the French having subdued almost all Spain, and being now in possession of Ciudad Rodrigo and Almeida. On the other hand Wellington still held Lisbon with parts of Portugal, Elvas and Badajoz, for Soult had not felt disposed to attempt the capture of the last two fortresses.

Battle of Barrosa, March 5, 1811.

Campaign of 1811.—Napoleon, whose attention was now directed towards Russia, refused to reinforce Masséna, but enjoined Soult to aid him by moving against Badajoz. Soult, therefore, leaving Victor before Cadiz, invested Badajoz (Jan. 26, 1811) and took it from the Spaniards (March 10). With the hope of raising the blockade of Cadiz, a force under Sir Thomas Graham (afterwards Lord Lynedoch [*q.v.*]) left that harbour by sea, and joining with Spanish troops near Tarifa, advanced by land against Victor's blockading force, a Spanish general, La Peña, being in chief command. As they neared Barrosa, Victor attacked them, the Allies numbering in the battle about 13,000 with 24 guns, 4000 being British; the French 9000, actually engaged, with 14 guns; but with 5000 more a few miles off and others in the French lines. Hard fighting, chiefly between the French and British, now ensued, and at one time the Barrosa ridge, the key of the position left by La Peña's orders, practically undefended, fell into the French hands: but Graham by a resolute counter-attack regained it, and Victor was in the end driven back. La Peña, who had in the battle itself failed to give proper support to Graham, would not pursue, and Graham declining to carry on further operations with him, re-entered Cadiz. The French afterwards resumed the blockade, so that although Barrosa was an allied victory, its object was not attained. The British loss was about 1200; the French 2000, 6 guns and an eagle.

Massena's Retreat.

On the day of the above battle Masséna, having destroyed what guns he could not horse, and skilfully gained time by a feint against Abrantes, began his retreat from before the lines, through Coimbra and Espinhal. His army was in serious distress; he was in want of food and supplies; most of his horses were dead, and his men were deserting. Wellington followed, directing the Portuguese to remove all boats from the Mondego and Douro, and to break up roads north of the former river. Beresford was detached to succour Badajoz, but was soon recalled, as it had fallen to Soult. Ney, commanding Masséna's rearguard, conducted the retreat with great ability. In the pursuit, Wellington adhered to his policy of husbanding his troops for future offensive operations, and let sickness and hunger do the work of the sword. This they effectually did. Nothing could well exceed the horrors of Masséna's retreat. Rearguard actions were fought at Pombal (March 10), Redinha (March 12) and Condeixa (March 13). Here Ney was directed to make a firm stand; but, ascertaining that the Portuguese were at Coimbra and the bridge there broken, and fearing to be cut off also from Murcella, he burnt Condeixa, and marched to Cazal Nova. An action took place here (March 14) and at Foz d'Arouce (March 15). Wellington now sent off Beresford with a force to retake Badajoz; and Masséna, sacrificing much of his baggage and ammunition, reached Celorico and Guarda (March 21). Here he was attacked by Wellington (March 29) and, after a further engagement at Sabugal (April 3, 1811), he fell back through Ciudad to Salamanca, having lost in Portugal nearly 30,000 men, chiefly from want and disease, and 6000 in the retreat alone.

Battle of Fuentes d'Onor, May 5, 1811.

The key to the remaining operations of 1811 lies in the importance attached by both Allies and French to the possession of the fortresses which guarded the two great roads from Portugal into Spain—Almeida and Ciudad Rodrigo on the northern, and Badajoz and Elvas on the southern road; all these except Elvas were in French hands. Wellington, on the 9th of April 1811, directed General Spencer to invest Almeida; he then set off himself to join Beresford before Badajoz, but after reconnoitring the fortress with his lieutenant he had at once to return north on the news that Masséna was moving to relieve Almeida. On the 3rd of May, Loison attacked him at Fuentes d'Onor near Almeida, and Masséna coming up himself made a more serious attack on the 5th of May. The Allies numbered about 33,000, with 42 guns; the French 45,000 with 30 guns. The battle is chiefly notable for the steadiness with which the allied right, covered by the Light Division in squares, changed position in presence of the French

cavalry; and for the extraordinary feat of arms of Captain Norman Ramsay, R.H.A., in charging through the French cavalry with his guns. Masséna failed to dislodge the Allies, and on the 8th of May withdrew to Salamanca, Almeida falling to Wellington on the 11th of May 1811. The allied loss in the fighting on both days at Fuentes d'Onor was about 1500: the French 3000.

In the meantime Soult (with 23,000 men and 50 guns), advancing to relieve Badajoz, compelled Beresford to suspend the siege, and to take up a position with about 30,000 men (of whom 7000 were British) and 38 guns behind the river Albuhera (or Albuera). Here Soult attacked him on the 16th of May. An unusually bloody battle ensued, in which the French efforts were chiefly directed against the allied right, held by the Spaniards. At one time the right appeared to be broken, and 6 guns were lost, when a gallant advance of Sir Lowry Cole's division restored the day, Soult then falling back towards Seville. The allied loss was about 7000 (including about half the British force); the French about 8000.

Battle of Albuera, May 16, 1811.

After this Wellington from Almeida rejoined Beresford and the siege of Badajoz was continued: but now Marshal Marmont, having succeeded Masséna, was marching southwards to join Soult, and, two allied assaults of Badajoz having failed, Wellington withdrew. Subsequently, leaving Hill in the Alemtejo, he returned towards Almeida, and with 40,000 men commenced a blockade of Ciudad Rodrigo, his headquarters being at Fuente Guinaldo. Soult and Marmont now fell back, the former to Seville, the latter to the valley of the Tagus, south of the pass of Baños.

In September, Marmont joined with the army of the north under General Dorsenne, coming from Salamanca—their total force being 60,000, with 100 guns—and succeeded (Sept. 25) in introducing a convoy of provisions into Ciudad Rodrigo. Before so superior a force, Wellington had not attempted to maintain the blockade; but on Marmont afterwards advancing towards him, he fought a rearguard action with him at El Bodon (Sept. 25), notable, as was Fuentes d'Onor, for the coolness with which the allied squares retired amidst the enemy's horsemen; and again at Fuente Guinaldo (Sept. 25 and 26) he maintained for 30 hours, with 15,000 men, a bold front against Marmont's army of 60,000, in order to save the Light Division from being cut off. At Aldea de Ponte there was a further sharp engagement (Sept. 27), but Wellington taking up a strong position near Sabugal, Marmont and Dorsenne withdrew once more to the valley of the Tagus and Salamanca respectively, and Wellington again blockaded Ciudad Rodrigo.

Thus terminated the main operations of this year. On the 28th of October 1811, Hill, by a very skilful surprise, captured Arroyo de los Molinos (between Badajoz and Trujillo), almost annihilating a French corps under Gérard; and in December 1811 the French were repulsed in their efforts to capture Tarifa near Cadiz. In the east of Spain Suchet took Tortosa (Jan. 1, 1811); Tarragona (June 28); and Murviedro (Oct. 26), defeating Blake's relieving force, which then took refuge in Valencia. Macdonald also retook Figueras which the Spaniards had taken on the 9th of April 1811 (Aug. 19). Portugal had now been freed from the French, but they still held Ciudad Rodrigo and Badajoz, the two main gates into Spain.

Campaign in Spain, 1812.—The campaign of 1812 marks an important stage in the war. Napoleon, with the Russian War in prospect, had early in the year withdrawn 30,000 men from Spain; and Wellington had begun to carry on what he termed a war of "magazines." Based on rivers (the navigation of which greatly improved) and the sea, he formed dépôts or magazines of provisions at many points, which enabled him always to take and keep the field. The French, on the other hand, had great difficulty in establishing any such reserves of food, owing to their practice of depending for sustenance entirely upon the country in which they were quartered. Wellington assumed the offensive, and by various movements and feints, aided the guerrilla bands by forcing the French corps to assemble in their districts, which not only greatly harassed them but also materially hindered the combination of their corps for concerted action. Having secretly got a battering train into Almeida and directed Hill, as a blind, to engage Soult by threatening Badajoz, he suddenly (Jan. 8, 1812) besieged Ciudad Rodrigo.

The French, still numbering nearly 200,000, now held the following positions: the Army of the North—Dorsenne (48,000)—was about the Pisuerga, in the Asturias, and along the northern coast; the Army of Portugal—Marmont (50,000)—mainly in the valley of the Tagus, but ordered to Salamanca; the Army of the South—Soult (55,000)—in Andalusia; the Army of the Centre—Joseph (19,000)—about Madrid.

The siege of Ciudad Rodrigo was calculated in the ordinary course to require twenty-four days: but on it becoming known that Marmont was moving northward, the assault was delivered after twelve days only (Jan. 19). The gallantry of the troops made it successful, though with the loss of Generals Craufurd and McKinnon, and 1300 men, and Marmont's battering train of 150 guns here fell into the allied hands. Then, after a feint of passing on into Spain, Wellington rapidly marched south and, with 22,000 men, laid siege to Badajoz (March 17, 1812), Hill with 30,000 covering the siege near Merida. Wellington was hampered by want of time, and had to assault prematurely. Soult and Marmont having begun to move to relieve the garrison, the assault was delivered on the night of the 7th of April, and though the assailants failed at the breaches, the carnage at which was terrible, a very daring escalade of one of the bastions and of the castle succeeded, and Badajoz fell, Soult's pontoon train being taken in it. After the assault, some deplorable excesses were committed by the victorious troops. The allied loss was 3600 in the assault alone and 5000 in the entire siege.

Siege of Ciudad Rodrigo, January 8-19, 1812.

Siege of Badajoz, March 17 to April 7, 1812.

The Allies had now got possession of the two great gates into Spain: and Hill, by an enterprise most skilfully carried out, destroyed (May 19) the Tagus bridge at Almaraz, by which Soult to the south of the river chiefly communicated with Marmont to the north. Wellington then, ostentatiously making preparations to enter Spain by the Badajoz line, once more turned northward, crossed the Tormes (June 17, 1812), and advanced to the Douro, behind which the French were drawn up. Marmont had erected at Salamanca some strong forts, the reduction of which occupied Wellington ten days, and cost him 600 men. The Allies and French now faced each other along the Douro to the Pisuerga. The river was high, and Wellington hoped that want of supplies would compel Marmont to retire, but in this he was disappointed.

On the 15th of July 1812, Marmont, after a feint against Wellington's left, suddenly, by a forced march, turned his right, and made rapidly towards the fords of Huerta and Alba on the Tormes. Some interesting manœuvres now took place, Wellington moving parallel and close to Marmont, but more to the north, making for the fords of Aldea Lengua and Santa Marta on the Tormes nearer to Salamanca, and being under the belief that the Spaniards held the castle and ford at Alba on that river. But Marmont's manœuvring and marching power had been underestimated, and on the 21st of July while Wellington's position covered Salamanca, and but indirectly his line of communications through Ciudad Rodrigo, Marmont had reached a point from which he hoped to interpose between Wellington and Portugal, on the Ciudad Rodrigo road. This he endeavoured to do on the 22nd of July 1812, which brought on the important battle of Salamanca (*q.v.*) in which Wellington gained a decisive victory, the French falling back to Valladolid and thence to Burgos. Wellington entered Valladolid (July 30), and thence marched against Joseph, who (July 21) had reached Blasco Sancho with reinforcements for Marmont. Joseph retired before him, and Wellington entered Madrid (Aug. 12, 1812), where, in the Retiro, 1700 men, 180 cannon, two eagles, and a quantity of stores were captured. Soult now raised the siege of Cadiz (Aug. 26), and evacuating Andalusia joined Suchet

Battle of Salamanca, July 22, 1812.

with some 55,000 men. Wellington then brought up Hill to Madrid.

On the 1st of September 1812, the French armies having begun once more to collect together, Wellington marched against the Army of the North, now under General Clausel, and laid siege to the castle of Burgos (Sept. 19) to secure the road towards Santander on the coast. But the strength of the castle had been underrated; Wellington had insufficient siege equipment and transport for heavy guns; five assaults failed, and Soult (having left Suchet in Valencia) and also the Army of Portugal were both approaching, so Wellington withdrew on the night of the 21st of October, and, directing the evacuation of Madrid, commenced the "Retreat from Burgos." In this retreat, although military operations were skilfully conducted, the Allies lost 7000 men, and discipline, as in that to Corunna, became much relaxed.

Siege of the Castle of Burgos, Sept. 19 to Oct. 21.

Retreat from Burgos.

By November 1812, Hill having joined him at Salamanca, Wellington once more had gone into cantonments near Ciudad Rodrigo, and the French armies had again scattered for convenience of supply. In spite of the failure before Burgos, the successes of the campaign had been brilliant. In addition to the decisive victory of Salamanca, Madrid had been occupied, the siege of Cadiz raised, Andalusia freed, and Ciudad Rodrigo and Badajoz stormed. Early in January also the French had abandoned the siege of Tarifa, though Valencia had surrendered to them (Jan. 9). One important result of the campaign was that the Spanish Cortes nominated Wellington (Sept. 22, 1812) to the unfettered command of the Spanish armies. For the operations of this campaign Wellington was created earl, and subsequently marquess of Wellington; duke of Ciudad Rodrigo by Spain, and marquis of Torres Vedras by Portugal.

Campaign in Spain and the South of France, 1813.—At the opening of 1813, Suchet, with 63,000 men, had been left to hold Valencia, Aragon and Catalonia; and the remainder of the French (about 137,000) occupied Leon, the central provinces and Biscay, guarding also the communications with France. Of these about 60,000 under Joseph were more immediately opposed to Wellington, and posted, in scattered detachments, from Toledo and Madrid behind the Tormes to the Douro, and along that river to the Esla. Wellington had further organized the Spanish forces—Castaños (40,000) with the guerrilla bands of Mina, Longa and others, was in Galicia, the Asturias and northern Spain; Copons (10,000) in Catalonia; Elio (20,000) in Murcia; Del Parque (12,000) in the Sierra Morena, and O'Donell (15,000) in Andalusia. More Portuguese troops had been raised, and reinforcements received from England, so that the Allies, without the Spaniards above alluded to, now numbered some 75,000 men, and from near the Coa watched the Douro and Tormes, their line stretching from their left near Lamego to the pass of Baños, Hill being on the right. The district of the Tras-os-Montes, north of the Douro, about the Tamega, Tua and Sabor, was so rugged that Wellington was convinced that Joseph would expect him to advance by the south of the river. He therefore, moving by the south bank himself with Hill, to confirm Joseph in this expectation, crossed the Tormes near and above Salamanca, having previously—which was to be the decisive movement—detached Graham, with 40,000 men, to make his way, through the difficult district above mentioned, towards Braganza, and then, joining with the Spaniards, to turn Joseph's right. Graham, crossing the Douro near Lamego, carried out his laborious march with great energy, and Joseph retired precipitately from the Douro, behind the Pisuerga. The allied army, raised by the junction of the Spanish troops in Galicia to 90,000, now concentrated near Toro, and moved towards the Pisuerga, when Joseph, blowing up the castle of Burgos, fell back behind the Ebro. Once more Wellington turned his right, by a sweeping movement through Rocamunde and Puente Arenas near the source of the Ebro, when he retreated behind the Zadorra near the town of Vitoria.

Santander was now evacuated by the French, and the allied line of communications was changed to that port. On the 20th of June Wellington encamped along the river Bayas, and the next day attacked Joseph. For a description of the decisive battle of Vitoria (June 21, 1813), see VITORIA. In it King Joseph met with a crushing defeat, and, after it, the wreck of his army, cut off from the Vitoria-Bayonne road, escaped towards Pampeluna. Within a few days Madrid was evacuated, and all the French forces, with the exception of the garrisons of San Sebastian (3000), Pampeluna (3000), Santona (1500), and the troops under Suchet holding posts in Catalonia and Valencia, had retired across the Pyrenees into France. The Spanish peninsula was, to all intents and purposes, free from foreign domination, although the war was yet far from concluded. The French struggled gallantly to the close: but now a long succession of their leaders—Junot, Soult, Victor, Masséna, Marmont, Joseph—had been in turn forced to recoil before Wellington; and while their troops fought henceforward under the depressing memory of many defeats, the Allies did so under the inspiriting influence of great successes, and with that absolute confidence in their chief which doubled their fighting power.

Battle of Vitoria, June 21, 1813.

For this decisive campaign, Wellington was made a field marshal in the British army, and created duke of Victory[1] by the Portuguese government in Brazil. He now, with about 80,000 men, took up a position with his left (the Spaniards) on the Bidassoa near San Sebastian. Thence his line stretched along the Pyrenees by the passes of Vera, Echallar, Maya and Roncesvalles, to Altobiscar; his immediate object now being to reduce the fortresses of San Sebastian and Pampeluna. Not having sufficient *matériel* for two sieges, he laid siege to San Sebastian only, and blockaded Pampeluna. Sir Thomas Graham commenced the active siege of San Sebastian on the 10th of July 1813, but as Soult was approaching to its relief, the assault was ordered for daylight on the 24th. Unfortunately a conflagration breaking out near the breaches caused it to be postponed until nightfall, when, the breaches in the interval having been strengthened, it was delivered unsuccessfully and with heavy loss. Wellington then suspended the siege in order to meet Soult, who endeavoured (July 25) to turn the allied right, and reach Pampeluna. Attacking the passes of Maya and Roncesvalles, he obliged their defenders to retire, after sharp fighting, to a position close to Sorauren, which, with 25,000 men, he attempted to carry (July 28). By this time Wellington had reached it from the allied left; reinforcements were pressing up on both sides, and about 12,000 allied troops faced the French. A struggle, described by Wellington as "bludgeon work," now ensued, but all efforts to dislodge the Allies having failed, Soult, withdrawing, manœuvred to his right towards San Sebastian. Wellington now assumed the offensive, and, in a series of engagements, drove the French back (Aug. 2) beyond the Pyrenees. These included Roncesvalles and Maya (July 25); Sorauren (July 28 and 30); Yanzi (Aug. 1); and Echallar and Ivantelly (Aug. 2), the total losses in them being about—Allies under 7000, French 10,000. After this, Wellington renewing the siege of San Sebastian carried the place, excepting the castle, after a heavy expenditure of life (Aug. 31). Upon the day of its fall Soult attempted to relieve it, but in the combats of Vera and St Marcial was repulsed. The castle surrendered on the 9th of September, the losses in the entire siege having been about—Allies 4000, French 2000. Wellington next determined to throw his left across the river Bidassoa to strengthen his own position, and secure the port of Fuenterrabia.

Siege of San Sebastian, July 10-24, 1813.

Battles of the Pyrenees, July 25 to August 2, 1813.

Storm of San Sebastian, August 31, 1813.

Now commenced a series of celebrated river passages, which had to be effected prior to the further invasion of France. At daylight on the 7th of October 1813 he crossed the Bidassoa in seven columns, and attacked the entire French position, which stretched in two heavily entrenched lines from north

[1] *Duque da Victoria*, often incorrectly duke of Vitoria. The coincidence of the title with the place-name of the battle which had not yet been fought when the title was conferred, is curious, but accidental.

Passage of the Bidassoa, October 7, 1813.

of the Irun-Bayonne road, along mountain spurs to the Great Rhune, 2800 ft. high. The decisive movement was a passage in strength near Fuenterrabia, to the astonishment of the enemy, who in view of the width of the river and the shifting sands, had thought the crossing impossible at that point. The French right was then rolled back, and Soult was unable to reinforce his right in time to retrieve the day. His works fell in succession after hard fighting, and he withdrew towards the river Nivelle. The loss was about—Allies, 1600; French, 1400. The passage of the Bidassoa "was a general's not a soldiers' battle" (Napier).

On the 31st of October Pampeluna surrendered, and Wellington was now anxious to drive Suchet from Catalonia before further invading France. The British government, however, in the interests of the continental powers, urged an immediate advance, so on the night of the 9th of November 1813 he brought up his right from the Pyrenean passes to the northward of Maya and towards the Nivelle. Soult's army (about 79,000), in three entrenched lines, stretched from the sea in front of St Jean de Luz along commanding ground to Amotz and thence, behind the river, to Mont Mondarin near the Nive. Each army had with it about 100 guns; and, during a heavy cannonade, Wellington on the 10th of November 1813 attacked this extended position of 16 m. in five columns, these being so directed that after carrying Soult's advanced works a mass of about 50,000 men converged towards the French centre near Amotz, where, after hard fighting, it swept away the 18,000 of the second line there opposed to it, cutting Soult's army in two. The French right then fell back to St Jean de Luz, the left towards points on the Nive. It was now late and the Allies, after moving a few miles down both banks of the Nivelle, bivouacked, while Soult, taking advantage of the respite, withdrew in the night to Bayonne. The allied loss was about 2700; that of the French 4000, 51 guns, and all their magazines. The next day Wellington closed in upon Bayonne from the sea to the left bank of the Nive.

Passage of the Nivelle, Nov. 10, 1813.

After this there was a period of comparative inaction, though during it the French were driven from the bridges at Urdains and Cambo. The weather had become bad, and the Nive unfordable; but there were additional and serious causes of delay. The Portuguese and Spanish authorities were neglecting the payment and supply of their troops. Wellington had also difficulties of a similar kind with his own government, and also the Spanish soldiers, in revenge for many French outrages, had become guilty of grave excesses in France, so that Wellington took the extreme step of sending 25,000 of them back to Spain and resigning the command of their army, though his resignation was subsequently withdrawn. So great was the tension at this crisis that a rupture with Spain seemed possible. These matters, however, having been at length adjusted, Wellington, who in his cramped position between the sea and the Nive could not use his cavalry or artillery effectively, or interfere with the French supplies coming through St Jean Pied de Port, determined to occupy the right as well as the left bank of the Nive. He could not pass to that bank with his whole force while Soult held Bayonne, without exposing his own communications through Irun. Therefore, on the 9th of December 1813, after making a demonstration elsewhere, he effected the passage with a portion of his force only under Hill and Beresford, near Ustaritz and Cambo, his loss being slight, and thence pushed down the river towards Villefranque, where Soult barred his way across the road to Bayonne. The allied army was now divided into two portions by the Nive; and Soult from Bayonne at once took advantage of his central position to attack it with all his available force, first on the left bank and then on the right. On the morning of the 10th of December he fell, with 60,000 men and 40 guns, upon Hope, who with 30,000 men and 24 guns held a position from the sea, 3 m. south of Biarritz on a ridge behind two lakes (or tanks) through Arcangues towards the Nive. Desperate fighting now ensued, but fortunately, owing to the intersected ground, Soult was compelled to advance slowly, and in the end, Wellington coming up with Beresford from the right bank, the French retired baffled. On the 11th and 12th of December there were engagements of a less severe character, and finally on the 13th of December Soult with 35,000 men made a vehement attack up the right bank of the Nive against Hill, who with about 14,000 men occupied some heights from Villefranque past St Pierre (Lostenia) to Vieux Moguerre. The conflict about St Pierre (Lostenia) was one of the most bloody of the war; but for hours Hill maintained his ground, and finally repulsed the French before Wellington, delayed by his pontoon bridge over the Nive having been swept away, arrived to his aid. The losses in the four days' fighting in the battles before Bayonne (or battles of the Nive) were—Allies about 5000, French about 7000. Both the British and Portuguese artillery, as well as infantry, greatly distinguished themselves in these battles.

Passage of the Nive, Dec. 9, 1813.

Battles before Bayonne, or Battles of the Nive, Dec. 10-13, 1813.

In eastern Spain Suchet (April 11, 1813) had defeated Elio's Murcians at Yecla and Villena, but was subsequently routed by Sir John Murray[1] near Castalla (April 13), who then besieged Tarragona. The siege was abandoned after a time, but was later on renewed by Lord W. Bentinck. Suchet, after the battle of Vitoria, evacuated Tarragona (Aug. 17) but defeated Bentinck in the combat of Ordal (Sept. 13).

Campaign in the South of France, 1814.—When operations recommenced in February 1814 the French line extended from Bayonne up the north bank of the Adour to the Pau, thence bending south along the Bidouze to St Palais, with advanced posts on the Joyeuse and at St Jean Pied de Port. Wellington's left, under Hope, watched Bayonne, while Beresford, with Hill, observed the Adour and the Joyeuse, the right trending back till it reached Urcuray on the St Jean Pied de Port road. Exclusive of the garrison of Bayonne and other places, the available field force of Soult numbered about 41,000, while that of the Allies, deducting Hope's force observing Bayonne, was of much the same strength. It had now become Wellington's object to draw Soult away from Bayonne, in order that the allied army might, with less loss, cross the Adour and lay siege to the place on both banks of the river.

At its mouth the Adour was about 500 yds. wide, and its entrance from the sea by small vessels, except in the finest weather, was a perilous undertaking, owing to the shifting sands and a dangerous bar. On the other hand, the deep sandy soil near its banks made the transport of bridging *matériel* by land laborious, and almost certain of discovery. Wellington, convinced that no effort to bridge below Bayonne would be expected, decided to attempt it there, and collected at St Jean Pied de Port and Passages a large number of country vessels (termed *chasse-marées*). Then, leaving Hope with 30,000 men to watch Bayonne, he began an enveloping movement round Soult's left. Hill on the 14th and 15th of February, after a combat at Garris, drove the French posts beyond the Joyeuse; and Wellington then pressed these troops back over the Bidouze and Gave[2] de Mauleon to the Gave d'Oleron. Wellington's object in this was at once attained, for Soult, leaving only 10,000 men in Bayonne, came out and concentrated at Orthes on the Pau. Then Wellington (Feb. 19) proceeded to St Jean de Luz to superintend the despatch of boats to the Adour. Unfavourable weather, however, compelled him to leave this to Sir John Hope and Admiral Penrose, so returning to the Gave d'Oleron he crossed it, and faced Soult on the Pau (Feb. 25). Hope in the meantime, after feints higher up the Adour, succeeded (Feb. 22 and 23) in passing 600 men across the river in boats. The nature of the ground, and there being no suspicion of an attempt at this point, led to the French coming out very tardily to oppose them; and when they did, some Congreve rockets (then a novelty) threw them into confusion, so that the right bank was held until, on the morning of the 24th, the flotilla of

Passage of the Adour, Feb. 22 to 26, 1814.

[1] Commander of a British expedition from the Mediterranean islands.

[2] "Gave" in the Pyrenees means a mountain stream or torrent.

chasse-marées appeared from St Jean de Luz, preceded by men-of-war boats. Several men and vessels were lost in crossing the bar; but by noon on the 26th of February the bridge of 26 vessels had been thrown and secured; batteries and a boom placed to protect it, 8000 troops passed over, and the enemy's gunboats driven up the river. Bayonne was then invested on both banks as a preliminary to the siege.

On the 27th of February Wellington, having with little loss effected the passage of the Pau below Orthes, attacked Soult. In this battle the Allies and French were of about equal strength 37,000): the former having 48 guns, the latter 40. Soult held a strong position behind Orthes on heights commanding the roads to Dax and St Sever. Beresford was directed to turn his right, if possible cutting him off from Dax, and Hill his left towards the St Sever road. Beresford's attack, after hard fighting over difficult ground, was epulsed, when Wellington, perceiving that the pursuing French had left a central part of the heights unoccupied, thrust up the Light Division into it, between Soult's right and centre. At the same time Hill, having found a ford above Orthes, was turning the French left, when Soult retreated just in time to save being cut off, withdrawing towards St Sever, which he reached on the 28th of February. The allied loss was about 2000; the French 4000 and 6 guns.

Battle of Orthes, Feb. 27, 1814.

From St Sever Soult turned eastwards to Aire, where he covered the roads to Bordeaux and Toulouse. Beresford, with 12,000 men, was now sent to Bordeaux, which opened its gates as promised to the Allies. Driven by Hill from Aire on the 2nd of March 1814, Soult retired by Vic Bigorre, where there was a combat (March 19), and Tarbes, where there was a severe action (March 20), to Toulouse behind the Garonne. He endeavoured also to rouse the French peasantry against the Allies, but in vain, for Wellington's justice and moderation afforded them no grievances. Wellington wished to pass the Garonne above Toulouse in order to attack the city from the south—its weakest side—and interpose between Soult and Suchet. But finding it impracticable to operate in that direction, he left Hill on the west side and crossed at Grenade below Toulouse (April 3). When Beresford, who had now rejoined Wellington, had passed over, the bridge was swept away, which left him isolated on the right bank. But Soult did not attack; the bridge (April 8) was restored; Wellington crossed the Garonne and the Ers, and attacked Soult on the 10th of April. In the battle of Toulouse the French numbered about 40,000 (exclusive of the local National Guards) with 80 guns; the Allies under 52,000 with 64 guns. Soult's position to the north and east of the city was exceedingly strong, consisting of the canal of Languedoc, some fortified suburbs, and (to the extreme east) the commanding ridge of Mont Rave, crowned with redoubts and earthworks. Wellington's columns, under Beresford, were now called upon to make a flank march of some two miles, under artillery, and occasionally musketry, fire, being threatened also by cavalry, and then, while the Spanish troops assaulted the north of the ridge, to wheel up, mount the eastern slope, and carry the works. The Spaniards were repulsed, but Beresford gallantly took Mont Rave and Soult fell back behind the canal. On the 12th of April Wellington advanced to invest Toulouse from the south, but Soult on the night of the 11th had retreated towards Villefranque, and Wellington then entered the city. The allied loss was about 5000; the French 3000. Thus, in the last great battle of the war, the courage and resolution of the soldiers of the Peninsular army were conspicuously illustrated.

Battle of Toulouse, April 10, 1814.

On the 13th of April 1814 officers arrived with the announcement to both armies of the capture of Paris, the abdication of Napoleon, and the practical conclusion of peace; and on the 18th a convention, which included Suchet's force, was entered into between Wellington and Soult. Unfortunately, after Toulouse had fallen, the Allies and French, in a sortie from Bayonne on the 14th of April, each lost about 1000 men: so that some 10,000 men fell after peace had virtually been made.

In the east, during this year (1814), Sir W. Clinton had, on the 16th of January, attacked Suchet at Molins de Rey and blockaded Barcelona (Feb. 7); the French posts of Lerida, Mequinenza and Monzon had also been yielded up, and Suchet, on the 2nd of March, had crossed the Pyrenees into France. Figueras surrendered to Cuesta before the end of May; and peace was formally signed at Paris on the 30th of May.

Thus terminated the long and sanguinary struggle of the Peninsular War. The British troops were partly sent to England, and partly embarked at Bordeaux for America, with which country war had broken out (see American War of 1812–15): the Portuguese and Spanish recrossed the Pyrenees: the French army was dispersed throughout France: Louis XVIII. was restored to the French throne: and Napoleon was permitted to reside in the island of Elba, the sovereignty of which had been conceded to him by the allied powers. For the operations of this campaign Wellington was created marquess of Douro and duke of Wellington, and peerages were conferred upon Beresford, Graham and Hill.

The events of the Peninsular War, especially as narrated in the Wellington Despatches, are replete with instruction not only for the soldier, but also for the civil administrator. Even in a brief summary of the war one salient fact is noticeable, that all Wellington's reverses were in connexion with his sieges, for which his means were never adequate. In his many battles he was always victorious, his strategy eminently successful, his organizing and administrative power exceptionally great, his practical resource unlimited, his soldiers most courageous; but he never had an army fully complete in its departments and warlike equipment. He had no adequate corps of sappers and miners, or transport train. In 1812 tools and material of war for his sieges were often insufficient. In 1813, when he was before San Sebastian, the ammunition ran short; a battering train, long demanded, reached him not only some time after it was needed, but even then with only one day's provision of shot and shell. For the siege of Burgos heavy guns were available in store on the coast; but he neither had, nor could procure, the transport to bring them up. By resource and dogged determination Wellington rose superior to almost every difficulty, but he could not overcome all; and the main teaching of the Peninsular War turns upon the value of an army that is completely organized in its various branches before hostilities break out. (C. W. R.)

PEÑISCOLA, a town of eastern Spain, in the province of Castellón de la Plana, and on the Mediterranean Sea, 5 m. by road S. of Benicarló. Pop. (1900), 3142. Peñiscola, often called the Gibraltar of Valencia, is a fortified seaport, with a lighthouse, built on a rocky headland about 220 ft. high, and only joined to the mainland by a narrow strip of sand. Originally a Moorish stronghold, it was captured in 1233 by James I. of Aragon, who entrusted it to the Knights Templar. In the 14th century it was garrisoned by the knights of Montesa, and in 1420 it reverted to the Crown. From 1415 it was the home of the schismatic pope Benedict XIII. (Pedro de Luna), whose name is commemorated in the Bufador de Papa Luna, a curious cavern with a landward entrance through which the sea-water escapes in clouds of spray.

PENITENTIAL (Lat. *poenitentiale, libellus poenitentialis,* &c.), a manual used by priests of the Catholic Church for guidance in assigning the penance due to sins. Such manuals played a large rôle in the early middle ages, particularly in Ireland, England and Frankland, and their influence in the moral education of the barbarian races has not received sufficient attention from historians. They were mainly composed of canons drawn from various councils and of *dicta* from writings of some of the fathers. Disciplinary regulations in Christian communities are referred to from the very borders of the apostolic age, and a system of careful oversight of those admitted to the mysteries developed steadily as the membership grew and dangers of contamination with the outside world increased. These were the elaborate precautions of the catechumenate, and —as a bulwark against the persecutions—the rigid system known as the Discipline of the Secret (*disciplina arcani*). The treatment of the lapsed, which produced the Novatian heresy, was also responsible for what has frequently been referred to as the first penitential. This is the *libellus* in which, according to Cyprian (*Ep.* 51), the decrees of the African synods of 251 and 255 were embodied for the guidance of the clergy in dealing with their repentant and returning flocks. This manual, which has been lost, was evidently not like the code-like compilations of the 8th century, and it is somewhat misleading to speak of it as a penitential. Jurisdiction in penance was still too closely limited to the upper ranks of the clergy to call forth such literature. Besides the bishop an official well versed in the penitential regulations of the Church, called the *poenitentiarius,* assigned due penalties for sins. For their guidance there was considerable conciliar legislation (*e.g.* Ancyra, Nicaea, Neocaesarea, &c.), and certain patristic letters which had acquired almost the force of decretals. Of the latter the most important were the three letters of St Basil of Caesarea (d. 379) to Bishop Amphilochus of Iconium containing over eighty headings.

Three things tended to develop these rules into something like a system of penitential law. These were the development of auricular confession and private penance; the extension of the penitential jurisdiction among the clergy owing to the growth of a parochial priesthood; and the necessity of adapting the penance to the primitive ideas of law prevailing among the newly converted barbarians, especially the idea of compensation by the *wergild.* In Ireland in the middle of the 5th century appeared the "canons of St Patrick." In the first half of the next century these were followed by others, notably those of St Finian (d. 552). At the same time the Celtic British Church produced the penitentials of St David of Menevia (d. 544) and of Gildas (d. 583) in addition to synodal legislation. These furnished the material to Columban (d. 615) for his *Liber de poenitentia* and his monastic rule, which had a great influence upon the continent of Europe. The Anglo-Saxon Church was later than the Irish, but under Theodore of Tarsus (d. 690), archbishop of Canterbury, the practice then in force was made the basis of the most important of all penitentials. The *Poenitentiale Theodori* became the authority in the Church's treatment of sinners for the next four centuries, both in England and elsewhere in Europe. The original text, as prepared by a disciple of Theodore, and embodying his decisions, is given in Haddan and Stubbs's *Councils and Ecclesiastical Documents relating to Great Britain and Ireland* (iii. 173 seq.). A *Penitentiale Commeani* (St Cumian), dating apparently from the early 8th century, was the third main source of Frankish penitentials. The extent and variety of this literature led the Gallican Church to exercise a sort of censorship in order to secure uniformity. After numerous synods, Bishop Haltigar of Cambrai was commissioned by Ebo of Reims in 829 to prepare a definitive edition. Haltigar used, among his other materials, a so-called *poenitentiale romanum,* which was really of Frankish origin. The canons printed by David Wilkins in his *Concilia* (1737) as being by Ecgbert of York (d. 767) are largely a translation into Anglo-Saxon of three books of Haltigar's penitentials. In 841 Hrabanus Maurus undertook a new *Liber poenitentium* and wrote a long letter on the subject to Heribald of Auxerre about 853. Then followed the treatise of Reginon of Prum in 906, and finally the collection made by Burchard, bishop of Worms, between 1012 and 1023. The codification of the canon law by Gratian and the change in the sacramental position of penance in the 12th century closed the history of penitentials.

Much controversy has arisen over the question whether there was an official papal penitential. It is claimed that (quite apart from Haltigar's *poenitentiale romanum*) such a set of canons existed early in Rome, and the attempt has been made by H. J. Schmitz in his learned treatise on penitentials (*Buszbücher und das kanonische Buszverfahren,* 1883 and 1898) to establish their pontifical character. The matter is still in dispute, Schmitz's thesis not having met with universal acceptance.

In addition to the works mentioned above the one important work on the penitentials was L. W. H. Wasserschleben's epoch-making study and collection of texts, *Die Bussordnungen der abendländischen Kirche nebst einer rechtsgeschichtlichen Einleitung* (Halle, 1851). See articles in Wetzer and Welte's *Kirchenlexikon,* Hauck's *Realencyklopädie,* and Haddan and Stubbs's *Councils.* See also Seebasz in *Zeitschrift für Kirchengeschichte,* xviii. 58. On the canons of St Patrick see the *Life of St Patrick* by J. B. Bury (pp. 233–275).

PENITENTIARY (med. Lat. *poenitentiarius,* from *poenitentia,* penance, *poena,* punishment, a term used both as adjective and substantive, referring either to the means of repentance or that of punishment. In its ecclesiastical use the word is used as the equivalent both of the Latin *poenitentiarius,* "penitentiary priest," and *poenitentiaria,* the dignity or office of a *poenitentiarius.* By an extension of the latter sense the name is applied to the department of the Roman Curia known as the apostolic penitentiary (*sacra poenitentiaria apostolica*), presided over by the cardinal grand penitentiary (*major poenitentiarius,* Ital. *penitenzier maggiore*) and having jurisdiction more particularly in all questions *in foro interno* reserved for the Holy See (see Curia Romana). In general, the *poenitentiarius,* or penitentiary priest, is in each diocese what the grand penitentiary is at Rome, *i.e.* he is appointed to deal with all cases of conscience reserved for the bishop. In the Eastern Church there are very early notices of such appointments; so far as the West is concerned, Hinschius (*Kirchenrecht,* i. 428, note 2) quotes from the chronicle of Bernold, the monk of St Blase (*c.* 1054–1100), as the earliest record of such appointment, that made by the papal legate Odo of Ostia in 1054. In 1215 the fourth Lateran Council, by its 10th canon, ordered suitable men to be ordained in all cathedral and conventual churches, to act as coadjutors and assistants to the bishops in hearing confessions and imposing penances. The rule was not immediately nor universally obeyed, the bishops being slow to delegate their special powers. Finally, however, the Council of Trent (Sess. xxiv. cap. viii. *de reform.*) ordered that, "wherever it could conveniently be done," the bishop should appoint in his cathedral a *poenitentiarius,* who should be a doctor or licentiate in theology or canon law and at least forty years of age.

See P. Hinschius, *Kirchenrecht*, i. 427, &c. (Berlin, 1869); Du Cange, *Glossarium*, *s.v.* "Poenitentiarius"; Herzog-Hauck, *Realencyklopädie* (ed. 1904), *s.v.* "Pönitentiarius."

PENKRIDGE, a town in the western parliamentary division of Staffordshire, England; 134 m. N.W. from London by the London & North-Western railway, on the small river Penk. Pop. (1901), 2347. Trade is chiefly agricultural and there are stone-quarries in the vicinity. The church of St Michael and All Angels, formerly collegiate and dedicated to St Mary, is a fine building principally Perpendicular, but with earlier portions. The Roman Watling Street passes from east to west 3 m. south of Penkridge. In the neighbourhood is Pillaton Hall, retaining a picturesque chapel of the 15th century.

PENLEY, WILLIAM SYDNEY (1852–), English actor, was born at Broadstairs, and educated in London, where his father had a school. He first made his mark as a comedian by his exceedingly amusing performance as the curate in *The Private Secretary*, a part in which he succeeded Beerbohm Tree; but he is even more associated with the title-rôle in Brandon Thomas's *Charley's Aunt* (1892), a farce which had an unprecedentedly long run and was acted all over the world.

PENMARC'H, a village of western France in the department of Finistère, 18 m. S.W. of Quimper by road. Pop. (1906), of the village, 387; of the commune, 5702. On the extremity of the peninsula on which it is situated are fortified remains of a town which was of considerable importance from the 14th to the 16th centuries and included, besides Penmarc'h, St Guénolé and Kerity. It owed its prosperity to its cod-banks, the disappearance of which together with the discovery of the Newfoundland cod-banks and the pillage of the place by the bandit La Fontenelle in 1595 contributed to its decadence. The church of St Nouna, a Gothic building of the early 16th century at Penmarc'h, and the church of St Guénolé, an unfinished tower of the 15th century and the church of Kerity (15th century) are of interest. The coast is very dangerous. On the Point de Penmarc'h stands the Phare d'Eckmuhl, with a light visible for 60 miles. There are numerous megalithic monuments in the vicinity.

PENN, WILLIAM (1621–1670), British admiral, was the son of Giles Penn, merchant and seaman of Bristol. He served his apprenticeship at sea with his father. In the first Civil War he fought on the side of the parliament, and was in command of a ship in the squadron maintained against the king in the Irish seas. The service was arduous and called for both energy and good seamanship. In 1648 he was arrested and sent to London, but was soon released, and sent back as rear admiral in the "Assurance" (32). The exact cause of the arrest is unknown, but it may be presumed to have been that he was suspected of being in correspondence with the king's supporters. It is highly probable that he was, for until the Restoration he was regularly in communication with the Royalists, while serving the parliament, or Cromwell, so long as their service was profitable, and making no scruple of applying for grants of the confiscated lands of the king's Irish friends. The character of "mean fellow" given him by Pepys is borne out by much that is otherwise known of him. But it is no less certain that he was an excellent seaman and a good fighter. After 1650 he was employed in the Ocean, and in the Mediterranean in pursuit of the Royalists under Prince Rupert. He was so active on this service that when he returned home on the 18th of March 1651 he could boast that he had not put foot on shore for more than a year. When the first Dutch War broke out Penn was appointed vice-admiral to Blake, and was present at the battle of the 28th of September off the Kentish Knock. In the three days' battle off Portland, February 1653, he commanded the Blue squadron, and he also served with distinction in the final battles of the war in June and July. In December he was included in the commission of admirals and generals at sea, who exercised the military command of the fleet, as well as "one of the commissioners for ordering and managing the affairs of the admiralty and navy." In 1654 he offered to carry the fleet over to the king, but in October of the same year he had no scruple in accepting the naval command in the expedition to the West Indies sent out by Cromwell, which conquered Jamaica. He was not responsible for the shameful repulse at San Domingo, which was due to a panic among the troops. On their return he and his military colleague Venables were sent to the Tower. He made humble submission, and when released retired to the estate he had received from confiscated land in Ireland. He continued in communication with the Royalists, and in 1660 had a rather obscure share in the Restoration. He was reappointed commissioner of the navy by the king, and in the second Dutch War served as "great captain commander" or captain of the fleet, with the duke of York (afterwards King James II.) at the battle of Lowestoft (June 3, 1665). When the duke withdrew from the command, Penn's active service ceased. He continued however to be a commissioner of the navy. His death occurred on the 16th of September 1670, and he was buried in the church of St Mary Redcliffe, Bristol. His portrait by Lely is in the Painted Hall at Greenwich. By his wife Margaret Jasper, he was the father of William Penn, the founder of Pennsylvania. Though Sir William Penn was not a high-minded man, he is a figure of considerable importance in British naval history. As admiral and general for the parliament he helped in 1653 to draw up the first code of tactics provided for the navy. It was the base of the "Duke of York's Sailing and Fighting Instructions," which continued for long to supply the orthodox tactical creed of the navy.

See the *Memorials of the Professional Life and Times of Sir William Penn*, by Granville Penn. (D. H.)

PENN, WILLIAM (1644–1718), English Quaker and founder of Pennsylvania, son of Admiral Sir William Penn (1621–1670) and Margaret Jasper, a Dutch lady, was born at Tower Hill, London, on the 14th of October 1644. During his father's absence at sea he lived at Wanstead in Essex, and went to school at Chigwell close by, in which places he was brought under strong Puritan influences. Like many children of sensitive temperament, he had times of spiritual excitement; when about twelve he was "suddenly surprised with an inward comfort, and, as he thought, an external glory in the room, which gave rise to religious emotions, during which he had the strongest conviction of the being of a God, and that the soul of man was capable of enjoying communication with Him." Upon the death of Cromwell, Penn's father, who had served the Protector because there was no other career open, remained with his family on the Irish estates which Cromwell had given him, of the value of £300 a year. On the resignation of Richard Cromwell he at once declared for the king and went to the court in Holland, where he was received into favour and knighted; and at the elections for the convention parliament he was returned for Weymouth. Meanwhile young Penn studied under a private tutor on Tower Hill until, in October 1660, he was entered as a gentleman commoner at Christ Church. He appears in the same year to have contributed to the *Threnodia*, a collection of elegies on the death of the young duke of Gloucester.

The rigour with which the Anglican statutes were revived, and the Puritan heads of colleges supplanted, roused the spirit of resistance at Oxford to the uttermost. With this spirit Penn, who was on familiar terms with John Owen (1616–1683), and who had already fallen under the influence of Thomas Loe the Quaker, then at Oxford, actively sympathized. He and others refused to attend chapel and church service, and were fined in consequence. How far his leaving the university resulted from this cannot be clearly ascertained. Anthony Wood has nothing regarding the cause of his leaving, but says that he stayed at Oxford for two years, and that he was noted for proficiency in manly sports. There is no doubt that in January 1662 his father was anxious to remove him to Cambridge, and consulted Pepys on the subject; and in later years he speaks of being "banished" the college, and of being whipped, beaten and turned out of doors on his return to his father, in the anger of the latter at his avowed Quakerism. A reconciliation, however, was effected; and Penn was sent to France to forget this

folly. The plan was for a time successful. Penn appears to have entered more or less into the gaieties of the court of Louis XIV., and while there to have become acquainted with Robert Spencer, afterwards earl of Sunderland, and with Dorothy, sister to Algernon Sidney. What, however, is more certain is that he somewhat later placed himself under the tuition of Moses Amyraut, the celebrated president of the Protestant college of Saumur, and at that time the exponent of liberal Calvinism, from whom he gained the patristic knowledge which is so prominent in his controversial writings. He afterwards travelled in Italy, returning to England in August 1664, with "a great deal, if not too much, of the vanity of the French garb and affected manner of speech and gait."[1]

Until the outbreak of the plague Penn was a student of Lincoln's Inn. For a few days also he served on the staff of his father—now great captain commander—and was by him sent back in April 1665 to Charles with despatches. Returning after the naval victory off Lowestoft in June, Admiral Penn found that his son had again become settled in seriousness and Quakerism. To bring him once more to views of life not inconsistent with court preferment, the admiral sent him in February 1666 with introductions to Ormonde's pure but brilliant court in Ireland, and to manage his estate in Cork round Shannangarry Castle, his title to which was disputed. Penn appears also later in the year to have been "clerk of the cheque" at Kinsale, of the castle and fort of which his father had the command. When the mutiny broke out in Carrickfergus Penn volunteered for service, and acted under Arran so as to gain considerable reputation. The result was that in May 1666 Ormonde offered him his father's company of foot, but, for some unexplained reason, the admiral demurred to this arrangement. It was at this time that the well-known portrait was painted of the great Quaker in a suit of armour; and it was at this time, too, that the conversion, begun when he was a boy by Thomas Loe in Ireland, was completed at the same place by the same agency.[2]

On the 3rd of September 1667 Penn attended a meeting of Quakers in Cork, at which he assisted to expel a soldier who had disturbed the meeting. He was in consequence, with others present, sent to prison by the magistrates. From prison he wrote to Lord Orrery, the president of Munster, a letter, in which he first publicly makes a claim for perfect freedom of conscience. He was immediately released, and at once returned to his father in London, with the distinctive marks of Quakerism strong upon him. Penn now became a minister of the denomination, and at once entered upon controversy and authorship. His first book, *Truth Exalted*, was violent and aggressive in the extreme. The same offensive personality is shown in *The Guide Mistaken*, a tract written in answer to John Clapham's *Guide to the True Religion*. It was at this time, too, that he appealed, not unsuccessfully, to Buckingham, who on Clarendon's fall was posing as the protector of the Dissenters, to use his efforts to procure parliamentary toleration.

Penn's first public discussion was with Thomas Vincent, a London Presbyterian minister, who had reflected on the "damnable" doctrines of the Quakers. The discussion, which had turned chiefly upon the doctrine of the Trinity, ended uselessly, and Penn at once published *The Sandy Foundation Shaken*, a tract of ability sufficient to excite Pepys's astonishment, in which orthodox views were so offensively attacked that Penn was placed in the Tower, where he remained for nearly nine months. The imputations upon his opinions and good citizenship, made as well by Dissenters as by the Church, he repelled in *Innocency with her Open Face*, in which he asserts his full belief in the divinity of Christ, the atonement, and justification through faith, though insisting on the necessity of good works. It was now, too, that he published the most important of his books, *No Cross, No Crown*, which contained an able defence of the Quaker doctrines and practices, and a scathing attack on the loose and unchristian lives of the clergy.

[1] Pepys, August 30, 1664.
[2] Webb, *The Penns and Peningtons* (1867), p. 174.

While completely refusing to recant Penn addressed a letter to Arlington in July 1669, in which, on grounds of religious freedom, he asked him to interfere. It is noteworthy, as showing the views then predominant, that he was almost at once set at liberty.

An informal reconciliation now took place with his father, who had been impeached through the jealousy of Rupert and Monk (in April 1668), and whose conduct in the operations of 1665 he had publicly vindicated; and Penn was again sent on family business to Ireland. At the desire of his father, whose health was fast failing, Penn returned to London in 1670. Having found the usual place of meeting in Gracechurch Street closed by soldiers, Penn, as a protest, preached to the people in the open street. With William Mead he was at once arrested and indicted at the Old Bailey on the 1st of September for preaching to an unlawful, seditious and riotous assembly, which had met together with force and arms. The Conventicle Act not touching their case, the trial which followed, and which may be read at length in Penn's *People's Ancient and Just Liberties Asserted*, was a notable one in the history of trial by jury. With extreme courage and skill Penn exposed the illegality of the prosecution, while the jury, for the first time, asserted the right of juries to decide in opposition to the ruling of the court. They brought in a verdict declaring Penn and Mead "guilty of speaking in Gracechurch Street," but refused to add "to an unlawful assembly"; then, as the pressure upon them increased, they first acquitted Mead, while returning their original verdict upon Penn, and then, when that verdict was not admitted, returned their final answer "not guilty" for both. The court fined the jurymen 40 marks each for their contumacy, and, in default of payment, imprisoned them, whereupon they vindicated and established for ever the right they had claimed in an action (known as Bushell's case from the name of one of the jurymen) before the court of common pleas, when all twelve judges unanimously declared their imprisonment illegal.

Penn himself had been fined for not removing his hat in court, had been imprisoned on his refusal to pay, and had earnestly requested his family not to pay for him. The fine, however, was settled anonymously, and he was released in time to be present at his father's death on the 16th of September 1670, at the early age of forty-nine. Penn now found himself in possession of a fortune of £1500 a year, and a claim on the Crown for £16,000, lent to Charles II. by his father. Upon his release Penn at once plunged into controversy, challenging a Baptist minister named Jeremiah Ives, at High Wycombe, to a public dispute and, according to the Quaker account, easily defeating him. No account is forthcoming from the other side. Hearing at Oxford that students who attended Friends' meetings were rigorously used, he wrote a vehement and abusive remonstrance to the vice-chancellor in defence of religious freedom. This found still more remarkable expression in the *Seasonable Caveat against Popery* (Jan. 1671).

In the beginning of 1671 Penn was again arrested for preaching in Wheeler Street meeting-house by Sir J. Robinson, the lieutenant of the Tower, formerly lord mayor, and known as a brutal and bigoted churchman. Legal proof being wanting of any breach of the Conventicle Act, and the Oxford or Five Mile Act also proving inapplicable, Robinson, who had some special cause of enmity against Penn, urged upon him the oath of allegiance. This, of course, the Quaker would not take, and consequently was imprisoned for six months. During this imprisonment Penn wrote several works, the most important being *The Great Case of Liberty of Conscience* (Feb. 1671), a noble defence of complete toleration. Upon his release he started upon a missionary journey through Holland and Germany; at Emden he founded a Quaker society, and established an intimate friendship with the princess palatine Elizabeth.

Upon his return home in the spring of 1672 Penn married Gulielma Springett, daughter of Mary Penington by her first husband, Sir William Springett; she appears to have been

equally remarkable for beauty, devotion to her husband, and firmness to the religious principles which she had adopted when little more than a child.[1] He now settled at Rickmansworth in Hertfordshire, and gave himself up to controversial writing. To this year, 1672, belong the *Treatise on Oaths* and *England's Present Interest Considered*. In the year 1673 Penn was still more active. He secured the release of George Fox, addressed the Quakers in Holland and Germany, carried on public controversies with Thomas Hicks, a Baptist, and John Faldo, an Independent, and published his treatise on the *Christian Quaker and his Divine Testimony Vindicated*, the *Discourse of the General Rule of Faith and Practice*,[2] *Reasons against Railing* (in answer to Hicks), *Counterfeit Christianity Detected*, and a *Just Rebuke to One-and-twenty Learned Divines* (an answer to Faldo and to *Quakerism no Christianity*). His last public controversy was in 1675 with Richard Baxter, in which, of course, each party claimed the victory.

At this point Penn's connexion with America begins. The province of New Jersey, comprising the country between the Hudson and Delaware rivers on the east and west, had been granted in March 1663–1664 by Charles II. to his brother; James in turn had in June of the same year leased it to Lord Berkeley and Sir G. Carteret in equal shares. By a deed, dated 18th of March 1673–1674, John Fenwick, a Quaker, bought one of the shares, that of Lord Berkeley (Stoughton erroneously says Carteret's) in trust for Edward Byllinge, also a Friend, for £1000. This sale was confirmed by James, after the second Dutch War, on the 6th of August 1680. Disputes having arisen between Fenwick and Byllinge, Penn acted as arbitrator; and then, Byllinge being in money difficulties, and being compelled to sell his interest in order to satisfy his creditors, Penn was added, at their request, to two of themselves, as trustee. The disputes were settled by Fenwick receiving ten out of the hundred parts into which the province was divided,[3] with a considerable sum of money, the remaining ninety parts being afterwards put up for sale. Fenwick sold his ten parts to two other Friends, Eldridge and Warner, who thus, with Penn and the other two, became masters of West Jersey, West New Jersey, or New West Jersey, as it was indifferently called.[4] The five proprietors appointed three commissioners, with instructions dated from London the 6th of August 1676, to settle disputes with Fenwick (who had bought fresh land from the Indians, upon which Salem was built, Penn being himself one of the settlers there) and to purchase new territories, and to build a town—New Beverley, or Burlington, being the result. For the new colony Penn drew up a constitution, under the title of "Concessions." The greatest care is taken to make this constitution "as near as may be conveniently to the primitive, ancient and fundamental laws of the nation of England." But a democratic element is introduced, and the new principle of perfect religious freedom stands in the first place (ch. xvi.). With regard to the liberty of the subject, no one might be condemned in life, liberty or estate, except by a jury of twelve, and the right of challenging was granted to the uttermost (ch. xvii.). Imprisonment for debt was not abolished (as Dixon states), but was reduced to a minimum (ch. xviii.), while theft was punished by twofold restitution either in value or in labour to that amount (ch. xxviii.). The provisions of ch. xix. deserve special notice. All causes were to go before three justices, with a jury. "They, the said justices, shall pronounce such judgment as they shall receive from, and be directed by the said twelve men, in whom only the judgment resides, and not otherwise. And in case of their neglect and refusal, that then one of the twelve, by consent of the rest, pronounce their own judgment as the justices should have done." The justices and constables, moreover, were elected by the people, the former for two years only (ch. xli.). Suitors might plead in person, and the courts were public (ch. xxii.). Questions between Indians and settlers were to be arranged by a mixed jury (ch. xxv.). An assembly was to meet yearly, consisting of a hundred persons, chosen by the inhabitants, freeholders and proprietors, one for each division of the province. The election was to be by ballot, and each member was to receive a shilling a day from his division, "that thereby he may be known to be the servant of the people." The executive power was to be in the hands of ten commissioners[5] chosen by the assembly. Such a constitution soon attracted large numbers of Quakers to West Jersey.

It was shortly before these occurrences that Penn inherited through his wife the estate of Worminghurst in Sussex, whither he removed from Rickmansworth. He now (July 25, 1677) undertook a second missionary journey to the Continent along with George Fox, Robert Barclay and George Keith. He visited particularly Rotterdam and all the Holland towns, renewed his intimacy with the princess Elizabeth at Herwerden, and, under considerable privations, travelled through Hanover, Germany, the lower Rhine and the electorate of Brandenburg, returning by Bremen and the Hague. It is worthy of recollection that the Germantown (Philadelphia) settlers from Kirchheim, one of the places which responded in an especial degree to Penn's teaching, are noted as the first who declared it wrong for Christians to hold slaves. Penn reached England again on the 24th of October. He tried to gain the insertion in the bill for the relief of Protestant Dissenters of a clause enabling Friends to affirm instead of taking the oath, and twice addressed the House of Commons' committee with considerable eloquence and effect. The bill, however, fell to the ground at the sudden prorogation.

In 1678 the popish terror came to a head, and to calm and guide Friends in the prevailing excitement Penn wrote his *Epistle to the Children of Light in this Generation*. A far more important publication was *An Address to Protestants of all Persuasions*, by William Penn, Protestant, in 1679; a powerful exposition of the doctrine of pure tolerance and a protest against the enforcement of opinions as articles of faith. This was succeeded, at the general election which followed the dissolution of the pensionary parliament, by an important political manifesto, *England's Great Interest in the Choice of this New Parliament*, in which he insisted on the following points: the discovery and punishment of the plot, the impeachment of corrupt ministers and councillors, the punishment of "pensioners," the enactment of frequent parliaments, security from popery and slavery, and ease for Protestant Dissenters. Next came *One Project for the Good of England*, perhaps the most pungent of all his political writings. But he was not merely active with his pen. He was at this time in close intimacy with Algernon Sidney, who stood successively for Guildford and Bramber. In each case, owing in a great degree to Penn's eager advocacy, Sidney was elected, only to have his elections annulled by court influence. Toleration for Dissenters seemed as far off as ever. Encouraged by his success in the West Jersey province, Penn again turned his thoughts to America. In repayment of the debt mentioned above he now asked from the Crown, at a council held on the 24th of June 1680, for "a tract of land in America north of Maryland, bounded on the east by the Delaware, on the west limited as Maryland [*i.e.* by New Jersey], northward as far as plantable"; this latter limit Penn explained to be "three degrees northwards." This formed a tract 300 m. by 160, of extreme fertility, mineral wealth and richness of all kinds. Disputes with James, duke of York, and with Lord Baltimore, who had rights over Maryland, delayed the matter until the 14th of March 1681, when the grant received the royal signature, and Penn was made master of the province of Pennsylvania. His own account of the name is that he suggested "Sylvania," that the king added the "Penn" in honour of his father, and that, although he

[1] For a very charming account of her, and the whole Pennington connexion, see Maria Webb's *The Penns and Penningtons*.

[2] See on this Stoughton's *Penn*, p. 113.

[3] The deed by which Fenwick and Byllinge conveyed West New Jersey to Penn, Lawry and Nicholas Lucas is dated the 10th of February 1674–1675.

[4] The line of partition was "from the east side of Little Egg Harbour, straight north, through the country, to the utmost branch of Delaware River."

[5] Penn's letter of the 26th of August 1676 says twelve, and Clarkson has followed this; but the Concessions, which were not assented to by the inhabitants until the 3rd of March 1676–1677, say ten.

strenuously objected and even tried to bribe the secretaries, he could not get the name altered. It should be added that early in 1682 Carteret, grandson of the original proprietor, transferred his rights in East Jersey to Penn and eleven associates, who soon afterwards conveyed one-half of their interest to the earl of Perth and eleven others. It is uncertain to what extent Penn retained his interest in West and East Jersey, and when it ceased. The two provinces were united under one governor in 1699, and Penn was a proprietor in 1700. In 1702 the government of New Jersey was surrendered to the Crown.

By the charter for Pennsylvania Penn was made proprietary of the province. He was supreme governor; he had the power of making laws with the advice, assent and approbation of the freemen, of appointing officers, and of granting pardons. The laws were to contain nothing contrary to English law, with a saving to the Crown and the privy council in the case of appeals. Parliament was to be supreme in all questions of trade and commerce; the right to levy taxes and customs was reserved to England; an agent to represent Penn was to reside in London; neglect on the part of Penn was to lead to the passing of the government to the Crown (which event actually took place in 1692); no correspondence might be carried on with countries at war with Great Britain. The importunity of the bishop of London extorted the right to appoint Anglican ministers, should twenty members of the colony desire it, thus securing the very thing which Penn was anxious to avoid—the recognition of the principle of an establishment.

Having appointed Colonel (Sir William) Markham, his cousin, as deputy, and having in October sent out three commissioners to manage his affairs until his arrival, Penn proceeded to draw up proposals to adventurers, with an account of the resources of the colony. He negotiated, too, with James and Lord Baltimore with the view, ultimately successful, of freeing the mouth of the Delaware, wrote to the Indians in conciliatory terms, and encouraged the formation of companies to work the infant colony both in England and Germany, especially the "Free Society of Traders in Pennsylvania," to whom he sold 20,000 acres, absolutely refusing, however, to grant any monopolies. In July he drew up a body of "conditions and concessions." This constitution, savouring strongly of Harrington's *Oceana*, was framed, it is said, in consultation with Sidney, but the statement is doubtful. Until the council of seventy-two (chosen by universal suffrage every three years, twenty-four retiring each year) and the assembly (chosen annually) were duly elected, a body of provisional laws was added.

It was in the midst of this extreme activity that Penn was made a Fellow of the Royal Society. Leaving his family behind him, Penn sailed with a hundred comrades from Deal in the "Welcome" on the 1st of September 1682. His *Last Farewell to England* and his letter to his wife and children contain a beautiful expression of his pious and manly nature. He landed at Newcastle on the Delaware on the 27th of October, his company having lost one-third of their number by small-pox during the voyage. After receiving formal possession, and having visited New York, Penn ascended the Delaware to the Swedish settlement of Upland, to which he gave the name of Chester. The assembly at once met, and on the 7th of December passed the "Great Law of Pennsylvania." The idea which informs this law is that Pennsylvania was to be a Christian state on a Quaker model. Philadelphia was now founded, and within two years contained 300 houses and a population of 2500. At the same time an act was passed, uniting under the same government the territories which had been granted by feoffment by James in 1682. Realistic and entirely imaginative accounts (*cf.* Dixon, p. 270), inspired chiefly by Benjamin West's picture, have been given of the treaty which there seems no doubt Penn actually made in November 1683 with the Indians. His connexion with them was one of the most successful parts of his management, and he gained at once and retained through life their intense affection.

Penn now wrote an account of Pennsylvania from his own observation for the "Free Society of Traders," in which he shows considerable power of artistic description. Tales of violent persecution of the Quakers, and the necessity of settling disputes which had arisen with Lord Baltimore, his neighbour in Maryland, brought Penn back to England (Oct. 2, 1684) after an absence of two years. In the spring of 1683 he had modified the original charter at the desire of the assembly, but without at all altering its democratic character.[1] He was, in reference to this alteration, charged with selfish and deceitful dealing by the assembly. Within five months after his arrival in England Charles II. died, and Penn found himself at once in a position of great influence. Penn now took up his abode at Kensington in Holland House, so as to be near the court. His influence there was great enough to secure the pardon of John Locke, who had been dismissed from Oxford by Charles, and of 1200 Quakers who were in prison. At this time, too, he was busy with his pen once more, writing a further account of Pennsylvania, a pamphlet in defence of Buckingham's essay in favour of toleration, in which he is supposed to have had some share, and his *Persuasive to Moderation to Dissenting Christians*, very similar in tone to the *One Project for the Good of England*. When Monmouth's rebellion was suppressed he appears to have done his best to mitigate the horrors of the western commission, opposing Jeffreys to the uttermost.[2] Macaulay has accused Penn of being concerned in some of the worst actions of the court at this time. His complete refutation by Forster, Paget, Dixon and others renders it unnecessary to do more than allude to the cases of the Maids of Taunton, Alderman Kiffin, and Magdalen College (Oxford).

In 1686, when making a third missionary journey to Holland and Germany, Penn was charged by James with an informal mission to the prince of Orange to endeavour to gain his assent to the removal of religious tests. Here he met Burnet, from whom, as from the prince, he gained no satisfaction, and who greatly disliked him. On his return he went on a preaching mission through England. His position with James was undoubtedly a compromising one, and it is not strange that, wishing to tolerate Papists, he should, in the prevailing temper of England, be once more accused of being a Jesuit, while he was in constant antagonism to their body. Even Tillotson took up this view strongly, though he at once accepted Penn's vehement disavowal. In 1687 James published the Declaration of Indulgence, and Penn probably drew up the address of thanks on the part of the Quakers. It fully reflects his views, which are further ably put in the pamphlet *Good Advice to the Church of England, Roman Catholics, and Protestant Dissenters*, in which he showed the wisdom and duty of repealing the Test Acts and Penal Laws. At the Revolution he behaved with courage. He was one of the few friends of the king who remained in London, and, when twice summoned before the council, spoke boldly in his behalf. He admitted that James had asked him to come to him in France; but at the same time he asserted his perfect loyalty. During the absence of William in 1690 he was proclaimed by Mary as a dangerous person, but no evidence of treason was forthcoming. It was now that he lost by death two of his dearest friends, Robert Barclay and George Fox. It was at the funeral of the latter that, upon the information of the notorious informer William Fuller (1670–1717 ?), an attempt was made to arrest him, but he had just left the ground; the fact that no further steps were then taken shows how little the government believed in his guilt. He now lived in retirement in London, though his address was perfectly well known to his friends in the council. In 1691, again on Fuller's evidence, a proclamation was issued for the arrest of Penn and two others as being concerned in Preston's plot. In 1692 he began to write again, both on questions of Quaker discipline and in defence of the sect. *Just Measures in an Epistle of Peace and Love, The New Athenians* (in reply to the attacks of the *Athenian Mercury*), and *A Key opening the Way to every Capacity* are the principal publications of this year.

Meantime matters had been going badly in Pennsylvania

[1] Dixon, p. 276.
[2] Burnet, iii. 66; Dalrymple, i. 282.

Penn had, in 1686, been obliged to make changes in the composition of the executive body, though in 1689 it reverted to the original constitution; the legislative bodies had quarrelled; and Penn could not gain his rents. The chief difficulty in Pennsylvania was the dispute between the province—*i.e.* the country given to Penn by the charter—and the "territories," or the lands granted to him by the duke of York by feoffment in August 1682, which were under the same government but had differing interests. The difficulties which Quaker principles placed in the way of arming the colony—a matter of grave importance in the existing European complications—fought most hardly against Penn's power. On the 21st of October 1692 an order of council was issued depriving Penn of the governorship of Pennsylvania and giving it to Colonel Benjamin Fletcher, the governor of New York. To this blow were added the illness of his wife and a fresh accusation of treasonable correspondence with James. In his enforced retirement he wrote the most devotional and most charming of his works—the collection of maxims of conduct and religion entitled *The Fruits of Solitude.* In December, thanks to the efforts of his friends at court, among whom were Buckingham, Somers, Rochester, and Henry Sidney, he received an intimation that no further steps would be taken against him. The accusation, however, had been public, and he insisted on the withdrawal being equally public. He was therefore heard in full council before the king, and honourably acquitted of all charge of treason. It was now that he wrote an *Essay towards the Present and Future Peace of Europe,* in which he puts forth the idea of a great court of arbitration, a principle which he had already carried out in Pennsylvania.

In 1694 (Feb. 23) his wife Gulielma died, leaving two sons, Springett and William, and a daughter Letitia, afterwards married to William Aubrey. Two other daughters, Mary and Hannah, died in infancy. He consoled himself by writing his *Account of the Rise and Progress of the People called Quakers.* The coldness and suspicion with which he had been regarded by his own denomination had now ceased, and he was once more regarded by the Quaker body as their leader. About the same time (Aug. 20) he was restored to the governorship of Pennsylvania; and he promised to supply money and men for the defence of the frontiers. In 1695 he went on another preaching mission in the west, and in March 1696 he formed a second marriage, with Hannah Callowhill, his son Springett dying five weeks later. In this year he wrote his work *On Primitive Christianity,* in which he argues that the faith and practice of the Friends were those of the early Church. In 1697 Penn removed to Bristol, and during the greater part of 1698 was preaching with great success against oppression in Ireland, whither he had gone to look after the property at Shannangarry.

In 1699 he was back in Pennsylvania, landing near Chester on the 30th of November, where the success of Colonel Robert Quary, judge of the admiralty in Pennsylvania—who was in the interests of those who wished to make the province an imperial colony—and the high-handed action of the deputy Markham in opposition to the Crown, were causing great difficulties. Penn carried with him particular instructions to put down piracy, which the objections of the Quakers to the use of force had rendered audacious and concerning which Quary had made strong representations to the home government, while Markham and the inhabitants apparently encouraged it. Penn and Quary, however, came at once to a satisfactory understanding on this matter, and the illegal traffic was vigorously and successfully attacked. In 1696 the Philadelphian Yearly Meeting had passed a resolution declaring slavery contrary to the first principles of the gospel. Penn, however, did not venture upon emancipation; but he insisted on the instruction of negroes, permission for them to marry, repression of polygamy and adultery, and proposed regulations for their trial and punishment. The assembly, however, a very mixed body of all nations, now refused to accept any of these proposals except the last-named. His great success was with the Indians; by their treaty with him in 1700 they promised not to help any enemy of England, to traffic only with those approved by the governor, and to sell furs or skins to none but inhabitants of the province. At the same time he showed his capacity for legislation by the share he took with Lord Bellomont at New York in the consolidation of the laws in use in the various parts of America.

Affairs now again demanded his presence in England. The king had in 1701 written to urge upon the Pennsylvania government a union with other private colonies for defence, and had asked for money for fortifications. The difficulty felt by the Crown in this matter was a natural one. A bill was brought into the lords to convert private into Crown colonies. Penn's son appeared before the committee of the house and managed to delay the matter until his father's return. On the 15th of September Penn called the assembly together, in which the differences between the province and the territories again broke out. He succeeded, however, in calming them, appointed a council of ten to manage the province in his absence, and gave a borough charter to Philadelphia. In May 1700, experience having shown that alterations in the charter were advisable, the assembly had, almost unanimously, requested Penn to revise it. On the 28th of October 1701 he handed it back to them in the form in which it afterwards remained. An assembly was to be chosen yearly, of four persons from each county, with all the self-governing privileges of the English House of Commons. Two-thirds were to form a quorum. The nomination of sheriffs, coroners, and magistrates for each county was given to the governor, who was to select from names handed in by the freemen. Moreover, the council was no longer elected by the people, but nominated by the governor, who was thus practically left single in the executive. The assembly, however, who, by the first charter, had not the right to propound laws, but might only amend or reject them, now acquired that privilege. In other respects the original charter remained, and the inviolability of conscience was again emphatically asserted. Penn reached England in December 1701. He once more assumed the position of leader of the Dissenters and himself read the address of thanks for the promise from the Throne to maintain the Act of Toleration. He now took up his abode again at Kensington, and published while here his *More Fruits of Solitude.*

In 1703 he went to Knightsbridge, where he remained until 1706, when he removed to Brentford, his final residence being taken up in 1710 at Field Ruscombe, near Twyford. In 1704 he wrote his *Life of Bulstrode Whitelocke.* He had now much trouble from America. The territorialists were openly rejecting his authority, and doing their best to obstruct all business in the assembly; and matters were further embarrassed by the injudicious conduct of Governor John Evans in 1706. Moreover, pecuniary troubles came heavily upon him, while the conduct of his son William, who became the ringleader of all the dissolute characters in Philadelphia, was another and still more severe trial. This son was married, and had a son and daughter, but appears to have been left entirely out of account in the settlement of Penn's proprietary rights on his death.

Whatever were Penn's great qualities, he was deficient in judgment of character. This was especially shown in the choice of his steward Ford, from whom he had borrowed money, and who, by dexterous swindling, had managed, at the time of his death, to establish, and hand down to his widow and son, a claim for £14,000 against Penn. Penn, however, refused to pay, and spent nine months in the Fleet rather than give way. He was released at length by his friends, who paid £7500 in composition of all claims. Difficulties with his government of Pennsylvania continued to harass him. Fresh disputes took place with Lord Baltimore, the owner of Maryland, and Penn also felt deeply what seemed to him the ungrateful treatment which he met with at the hands of the assembly. He therefore in 1710 wrote, in earnest and affectionate language, an address to his "old friends," setting forth his wrongs. So great was the effect which this produced that the assembly which met in October of that year was entirely in his interests; revenues were properly paid; the disaffected were silenced and complaints

were hushed; while an advance in moral sense was shown by the fact that a bill was passed prohibiting the importation of negroes. This, however, when submitted to the British parliament, was cancelled. Penn now, in February 1712, being in failing health, proposed to surrender his powers to the Crown. The commission of plantations recommended that Penn should receive £12,000 in four years from the time of surrender, Penn stipulating only that the queen should take the Quakers under her protection; and £1000 was given him in part payment. Before, however, the matter could go further he was seized with apoplectic fits, which shattered his understanding and memory. A second attack occurred in 1713. He died on the 30th of May 1718, leaving three sons by his second wife, John, Thomas and Richard, and was buried along with his first and second wives at Jourdans meeting-house, near Chalfont St Giles in Buckinghamshire. In 1790 the proprietary rights of Penn's descendants were bought up for a pension of £4000 a year to the eldest male descendant by his second wife, and this pension was commuted in 1884 for the sum of £67,000.

Penn's *Life* was written by Joseph Besse, and prefixed to the collected edition of Penn's *Works* (1726); see also the bibliographical note to the article in *Dict. Nat. Biog.* W. Hepworth Dixon's biography, refuting Macaulay's charges, appeared in 1851. In 1907 Mrs Colquhoun Grant, one of Penn's descendants, brought out a book, *Quaker and Courtier: the Life and Work of William Penn.* (O. A.)

PENNANT, THOMAS (1726–1798), British naturalist and antiquary, was descended from an old Welsh family, for many generations resident at Downing, Flintshire, where he was born on the 14th of June 1726. He received his early education at Wrexham, and afterwards entered Queen's College, Oxford, but did not take a degree. At twelve years of age he was inspired with a passion for natural history through being presented with Francis Willughby's *Ornithology*; and a tour in Cornwall in 1746–1747 awakened his strong interest in minerals and fossils. In 1750 his account of an earthquake at Downing was inserted in the *Philosophical Transactions*, where there also appeared in 1756 a paper on several coralloid bodies he had collected at Coalbrookdale, Shropshire. In the following year, at the instance of Linnaeus, he was elected a member of the Royal Society of Upsala. In 1766 he published the first part of his *British Zoology*, a work meritorious rather as a laborious compilation than as an original contribution to science. During its progress he visited the continent of Europe and made the acquaintance of Buffon, Voltaire, Haller and Pallas. In 1767 he was elected F.R.S. In 1771 was published his *Synopsis of Quadrupeds*, afterwards extended into a *History of Quadrupeds*. At the end of the same year he published *A Tour in Scotland in 1769*, which proving remarkably popular was followed in 1774 by an account of another journey in Scotland, in two volumes. These works have proved invaluable as preserving the record of important antiquarian relics which have now perished. In 1778 he brought out a similar *Tour in Wales*, which was followed by a *Journey to Snowdon* (pt. i. 1781; pt. ii. 1783), afterwards forming the second volume of the *Tour*. In 1782 he published a *Journey from Chester to London*. He brought out *Arctic Zoology* in 1785–1787. In 1790 appeared his *Account of London*, which went through a large number of editions, and three years later he published the *Literary Life of the late T. Pennant, written by himself*. In his later years he was engaged on a work entitled *Outlines of the Globe*, vols. i. and ii. of which appeared in 1798, and vols. iii. and iv., edited by his son David Pennant, in 1800. He was also the author of a number of minor works, some of which were published posthumously. He died at Downing on the 16th of December 1798.

PENNAR, or PENNER, two rivers of southern India, distinguished as North and South. The native name is Pinakini. Both rise near the hill of Nandidrug in Mysore state, and flow eastward into the Bay of Bengal. The northern is the more important and has a total length of 355 m., that of the southern being 245 m. This latter bears the alternative name of the Ponniar. The Pennar (northern) river canal system comprises more than 30 m. of canals, irrigating 155,500 acres.

PENNE, a town and episcopal see of Italy, in the province of Teramo, 26 m. S.E. of Teramo, and 16 m. inland from the Adriatic, 1437 ft. above sea-level. Pop. (1901), 10,394. The cathedral has been much altered; in its treasury is some fine 13th-century (?) silversmiths' work; the church of S. Giovanni has a fine cross by Nicola di Guardiagrele, and that of S. Maria in Colleromano, outside the town, a Romanesque portal. Many of the houses have fine terra-cotta friezes. It occupies the site of the ancient Pinna, the chief city of the Vestini, who entered into alliance with Rome in 301 B.C. and remained faithful to her through the Hannibalic wars and even during the revolt of the Italian allies in 90 B.C. No remains of the Roman period exist, even the city walls being entirely medieval.

See G. Colasanti, *Pinna* (Rome, 1907); V. Bindi, *Monumenti degli Abruzzi* (Naples, 1889, pp. 565 sqq.).

PENNELL, JOSEPH (1860–), American artist and author, was born in Philadelphia on the 4th of July 1860, and first studied there, but like his compatriot and friend, J. M. Whistler, he afterwards went to Europe and made his home in London. He produced numerous books (many of them in collaboration with his wife, Elizabeth Robins Pennell), but his chief distinction is as an original etcher and lithographer, and notably as an illustrator. Their close acquaintance with Whistler led to Mr and Mrs Pennell undertaking a biography of that artist in 1906, and, after some litigation with his executrix on the right to use his letters, the book was published in 1908.

PENNI, GIANFRANCESCO (1488–1528), Italian painter, surnamed "Il Fattore," from the relation in which he stood to Raphael, whose favourite disciple he was after Giulio Romano, was a native of Florence, but spent the latter years of his life in Naples. He painted in oil as well as in fresco, but is chiefly known for his work in the Loggie of the Vatican.

PENNINE CHAIN, an extensive system of hills in the north of England. The name is probably derived from the Celtic *pen*, high, appearing in the Apennines of Italy and the Pennine Alps. The English system is comprised within the following physical boundaries. On the N. a well-marked depression, falling below 500 ft. in height, between the upper valleys of the Irthing and the south Tyne, from which it is known as the Tyne Gap, separates the Pennines from the system of the Cheviots. On the N.E., in Northumberland, the foothills extend to the North Sea. On the N.W. the Eden valley forms part of the boundary between the Pennines and the hills of the Lake District, and the division is continued by the upper valley of the Lune. For the rest the physical boundaries consist of extensive lowlands—on the E. the vale of York, on the W. the coastal belt of Lancashire and the plain of Cheshire, and on the S. and S.E. the valley of the river Trent. The Pennines thus cover parts of Cumberland, Westmorland and Northumberland, Lancashire and Yorkshire, Cheshire and Derbyshire, while the southern foothills extend into Staffordshire and Nottinghamshire.

The Pennine system is hardly a range, but the hills are in effect broken up into numerous short ranges by valleys cut back into them in every direction, for the Pennines form a north and south watershed which determines the course of all the larger rivers in the north of England. The chain is divided into two sections by a gap formed by the river Aire flowing east, a member of the Humber basin, and the Ribble flowing west and entering the Irish Sea through a wide estuary south of Morecambe Bay.

The northern section of the Pennine system is broader and generally higher than the southern. Its western slope is generally short and steep, the eastern long and gradual; this distinction applying to the system at large. In the north-west a sharp escarpment overlooks the Eden valley. This is the nearest approach to a true mountain range in the Pennine system and indeed in England. It is known as the Cross Fell Edge from its highest point, Cross Fell (2930 ft.), to the south-east of which a height of 2780 ft. is reached in Milburn Forest, and of 2591 ft. in Mickle Fell. This range is marked off eastward by the upper valleys of the south Tyne and the Tees, and, from the divide between these two, branch ranges spring eastward, separated by the valley of the Wear, at the head of which are Burnhope Seat (2452 ft.) and Dead Stones (2326 ft.). In the northern range the highest point is Middlehope Moor (2206 ft.), and in the southern, Chapel Fell Top (2294 ft.). It is thus seen that the

higher elevations, like the steeper slopes, lie towards the west. Cross Fell Edge terminates southward at a high pass (about 1400 ft.) between the head of the Belah, a tributary of the Eden, and the Greta, a tributary of the Tees. This pass is followed by the Tebay and Barnard Castle line of the North Eastern railway. The hills between the Lune valley on the west and the headstream of the Eden and the Ribble on the east are broken into masses by the dales of tributaries to the first-named river—here the chief elevations are Wild Boar Fell (2323 ft.), Whernside (2414 ft.), and Ingleborough (2373 ft.). The Ribble and Eden valleys afford a route for the main line of the Midland railway. Well-marked eastward ranges occur here between Swaledale and the river Ure, which traverses the celebrated Wensleydale (*q.v.*), and between the Ure and Wharfe. In the first the highest points are High Seat (2328 ft.) and Great Shunner Fell (2340 ft.); and in the second Buckden Pike (2302 ft.) and Great Whernside (2310 ft.). There is then a general southerly slope to the Aire gap.

The southern section of the system calls for less detailed notice. Heights exceeding 2000 ft. are rare. The centre of the section is the well-known Peak (*q.v.*) of Derbyshire. Both here and throughout the system the summits of the hills are high uplands, rounded or nearly flat, consisting of heathery, peaty moorland or hill pasture. The profile of the Pennines is thus not striking as a rule, but much fine scenery is found in the narrow dales throughout; Wensleydale, Wharfedale and other Yorkshire dales being no less famous than the dales of Derbyshire. In the parts about Settle below Ingleborough, in Derbyshire, and elsewhere, remarkable caverns and subterranean watercourses in the limestone have been explored to great depths. In Ingleborough itself are the Ingleborough cave, near Clapham; the chasm of Gaping Ghyll, over 350 ft. deep; Helln or Hellan Pot, a vast swallow-hole 359 ft. deep, only exceeded by Rowten Pot (365 ft.) near Whernside; and many others. Malham Tarn, near the head of the Aire, is drained by a stream which quickly disappears below ground, and the Aire itself is fed by a brook gushing forth in full stream at the foot of the cliffs of Malham Cove. A notable example in Derbyshire is the disappearance of the Wye into Plunge Hole, after which it traverses Poole's Cave, close to Buxton. There may also be noted the remarkable series of caverns near Castleton (*q.v.*). Lakes are few and small in the Pennine district, but in some of the upland valleys, such as those of the Nidd and the Etherow, reservoirs have been formed for the supply of the populous manufacturing districts of Lancashire and the West Riding of Yorkshire, which lie on either flank of the system between the Aire gap and the Peak. (For geology see ENGLAND and articles on the several counties.)

PENNSYLVANIA, a North Atlantic state of the United States of America and one of the original thirteen, lying for the most part between latitudes 39° 43′ 26·3″ and 42° N. and between longitudes 74° 40′ and 80° 31′ 36″ W. The state is in the form of a rectangle, except in the north-west where a triangular projection, extending to 42° 15′ N. lat., gives it a shoreline of almost 40 m. on Lake Erie, on the east where the Delaware river with two large bends separates it from New York and New Jersey, and in the south-east where the arc of a circle which was described with a 12-m. radius from New Castle, Delaware, forms the boundary between it and Delaware. The forty-second parallel of N. latitude forms the boundary between it and New York on the N.; Mason and Dixon's line is the border between it and Maryland and West Virginia on the south and a north and south line marks the boundary between it and West Virginia and Ohio on the west. The total area is 45,126 sq. m. and of this 294 sq. m. are water surface.

Physical Features.—Pennsylvania skirts the coastal plain in the south-east below Philadelphia, is traversed from north-east to south-west by the three divisions of the Appalachian province—Piedmont or older Appalachian belt, younger Appalachian ridges and valleys and Alleghany plateau—and in the north-west corner is a small part of the Erie plain. The entire surface has a mean elevation of about 1100 ft. above the sea. It rises from 20 ft. or less on the bank of the Delaware between Philadelphia and Chester to 2000–3000 ft. on the higher ridges in the middle section (3136 ft. on Blue Knob in Bedford county), and falls again to 900–1000 ft. on the Ohio border and to 750 ft. or less on the Erie plain; in the south-east is an area of about 6100 sq. m. that is less than 500 ft. above the sea, while on the ridges in the middle of the state is an aggregate area of about 2000 sq. m. that everywhere exceeds 2000 ft. in elevation. The area below 500 ft. is mostly in the Triassic lowland of the Piedmont region, or, as the Pennsylvania portion of it is called, the south-east province. This is an undulating plain which has been produced by the wearing away of weak sandstones, &c. On the north and west borders of this plain are two parts of a chain of semi-detached and usually rounded hills, known as the South Mountains. The north-east part is a south-westward arm of the New England uplands, is known as the Reading Prong, and extends from New Jersey through Easton to Reading. The south-west part is a north-eastern prolongation of the Virginia Piedmont, is known as the Cumberland Prong, and extends N.N.E. through the south part of Cumberland county. In the Reading Prong most of the hills rise 900–1000 ft. above the sea and about one-half that height above the surrounding country; in the Cumberland Prong their height increases to the southward until, on the Maryland border, they rise 2100 ft. above the sea and 1400 ft. above the adjoining plain. Another range of hills, known as the Trenton Prong, extends from the northern suburbs of Philadelphia both westward and southward through Chester, Delaware, Lancaster and York counties, but these rise only 400–600 ft. above the sea and have few steep slopes. Both of these ranges of hills are composed of hard crystalline rocks, and between them lies the lowland eroded on the weaker sandstones and sediments. In Bucks and Montgomery counties is a large sandstone area; traversing Chester county is the narrow Chester valley with a limestone bottom, and in Lancaster county is the most extensive limestone plain. The Pennsylvania portion of the younger Appalachian ridges and valleys, known as the central province of the state, embraces the region between the South Mountains, on the south-east, and the crest of the Alleghany plateau or Alleghany Front, on the north-west. It extends from south-west to north-east about 230 m. and has a nearly uniform width of 50 m. except that it narrows rapidly as it approaches the north-east corner of the state. The ridges and intervening valleys, long parts of which have an approximately parallel trend from south-west to north-east, were formed by the erosion of folded sediments of varying hardness, the weak belts of rock being etched out to form valleys and the hard belts remaining as mountain ridges. After the folding the whole region was worn down nearly to sea-level, forming a low plain which bevelled across the geological structure of the entire state, including the Piedmont area to the south-east and the plateau area to the north-west. Then came a broad uplift followed by the erosion which carved out the valleys, leaving hard rocks as mountain ridges which rise about to the level of the old erosion plain. In Bedford county and elsewhere the ridges rise to 2400 ft. or more above the sea, but their more usual height is 1400 to 2000 ft. above the sea and 500 to 1000 ft. above the intervening valleys. Their crest lines are often of nearly uniform height for miles and generally are little broken except by an occasional V-shaped wind gap, a narrow water gap or a rounded knob. The valleys rarely exceed more than a few miles in width, are usually steep-sided, and frequently are traversed by longitudinal ranges of hills and cross ridges; but the Pennsylvania portion of the Appalachian or Great Valley, which forms a distinct division of the central province and lies between the South Mountains and the long rampart of Blue Mountain, is about 10 m. in width on the Maryland border and to the north-east its width increases to 20 m. The north-west part of it is a slate belt that has been much dissected by eroding streams, but the south-east part is a gently rolling belt of limestone to which occasionally a steep hill descends from the slate belt. The Pocono plateau, into which the central province merges at its north-east extremity, is a continuation of the Catskill plateau southward from New York and covers Wayne, Pike and Monroe counties and the east portion of Carbon county. Its surface is underlaid by a hard sandstone and conglomerate which erode slowly, and the general upland level, which is 1400–1800 ft. above the sea, is little broken except by shallow valleys and occasional knobs. The Alleghany plateau, which extends from the crest of the Alleghany Front to and beyond the west and north borders of Pennsylvania and covers more than one-half of the state, is much more dissected. In Tioga and Potter counties on the north middle border, it rises 2400–2500 ft. above the sea, but from this height the general upland level falls gradually to 1200–1300 ft. in the south-west and 900–1000 ft. along the Ohio border, and in Erie county there is a sudden fall of about 200 ft. to the Erie plain. In the northern, middle and south-west portions of this plateau province the upland is cut by an intricate network of narrow valleys and ravines that are commonly 300–600 ft. deep and occasionally 800–1000 ft. deep, but west of the Allegheny river, where harder rocks have resisted such deep dissection and glacial drift has filled depressions or smoothed rough surfaces, the uplands are broader and the valleys wider and shallower. Most of the Pennsylvania shore of Lake Erie is lined with a wall of sand and clay 50–100 ft. in height and along the foot of this is only a narrow beach, but in front of the city of Erie the shore currents have formed a spit, known as Presque Isle, which affords a good harbour.

The Pocono plateau, nearly all of the central and south-east provinces and the north-east portion of the Alleghany plateau are drained by the Susquehanna and Delaware river-systems into the Chesapeake and Delaware Bays; the greater part of the Alleghany plateau is drained by the Allegheny and Monongahela rivers into the Ohio river; the extreme southern portion of the central province and the extreme western portion of the south-east province are drained by tributaries of the Potomac; the Erie plain is drained by short streams into Lake Erie; and a very small section of the Alleghany plateau, in the northern part of Potter county, is drained by the Genesee river into Lake Ontario. The Susquehanna drains about 21,000 sq. m. of the state; the Ohio, Allegheny and Monongahela

14,747 sq. m.; and the Delaware 6443 sq. m. The Susquehanna is a wide and shallow stream with a zigzag course and numerous islands, but both the Susquehanna and the Delaware, together with their principal tributaries, flow for the most part transverse to the geological structure, and in the gorges and water-gaps through which they pass ridges in the mountain region, is some of the most picturesque scenery in the state; a number of these gorges, too, have been of great economic importance as passages for railways. The lower portion of the Delaware river has been entered by the sea as the result of the depression of the land, giving a harbour, at the head of which developed the city of Philadelphia. The present course of the Upper Allegheny river is the result of the glacier which blocked the northward drainage of the region through which it flows and turned it southward. The Monongahela is an older stream, but like the Allegheny, it meanders much, and both rivers now flow in deeply intrenched valleys. The few small lakes of the state are mostly on the Pocono plateau, where they were formed by glaciation; here, too, are some streams with picturesque cascades.

Fauna.—Under the protection of a game commission which was created in 1895, of some game preserves which have been established by this commission, and of various laws affecting wild animals and birds, the numbers of Virginia deer, black bear, rabbits, ruffed grouse, quail and wild turkeys have increased until in some of the wilder sections they are quite plentiful, while the numbers of weasels, minks, lynx and foxes have been diminished. Squirrels, racoons, woodchucks and skunks are common, and musk-rats, porcupines and opossums are found in some sections. Two species of venomous snakes—the rattlesnake and the copper-head—occur in the sparsely settled regions. The avifauna include—among the birds of prey—the red-shouldered hawk, red-tailed hawk, marsh hawk, Cooper's hawk, sharp-shinned hawk and sparrow hawk; the great horned owl, the barn owl and the screech owl; and bald eagles are not uncommon in the mountainous regions along the larger rivers. The "turkey-buzzard"—turkey-vulture—(very valuable as a scavenger) is seen occasionally, especially in the south and south-west. The game birds include the ruffed grouse, quail and English pheasant which have increased rapidly under protection), besides woodcock, snipe, many species of ducks and a few Canada geese. The song and insectivorous birds—thrushes, flycatchers, vireos and woodpeckers—of this latitude, are well represented, and the high plateaus (particularly the Pocono plateau) have especial ornithological interest as the tarrying-places, during the migratory seasons, of many species of birds whose natural breeding ground is much farther north. Perch, sunfish, trout, bass, pike and pickerel abound in many of the streams. Yellow perch are especially plentiful in the lakes on the Pocono plateau. Pike-perch and a few blue pike are taken in the Susquehanna, where shad are no longer plentiful since work was begun on McCall's Ferry dam, and in 1908 the entire catch for the river was valued at about $20,000, but in the Delaware there are valuable shad and herring fisheries. The blue pike, whitefish and herring, obtained on Lake Erie are of considerable commercial importance. In 1908 the total catch on Lake Erie was valued at $200,869, the principal items being herring ($90,108), blue pike ($13,657) and whitefish ($31,580). The catch of herring was twice as much in 1908 as in 1907 and that of whitefish nearly four times as much in 1908 as in 1907; this increase was attributed to the work of the state hatcheries. There were eight hatcheries in 1910 and the number of fish distributed from these during 1908 was about 662,000,000; they consisted chiefly of pickerel, yellow perch, wall-eyed pike, whitefish, herring, blue pike, trout and shad.

Flora.—Except on some portions of the Pocono plateau, Pennsylvania was originally well forested, and, although most of the merchantable timber has been cut, about one-half of the state is still woodland. On the higher elevations the trees are mostly white pine, yellow pine and hemlock, but in the valleys and lower levels are oaks, hickories, maples, elms, birches, locusts, willows, spruces, gums, buckeyes, the chestnut, black walnut, butternut, cedar, ash, linden, poplar, buttonwood, hornbeam, holly, catalpa, magnolia, tulip-tree, Kentucky coffee tree, sassafras, wild cherry, pawpaw, crab-apple and other species. The flora is most varied in the Susquehanna Valley below Harrisburg, and on Presque Isle are some plants peculiar to the Lake region. The state has forest reserves (918,066 acres in 1910) in 26 counties, the largest areas being in Potter, Clinton, Center, Cameron, Lycoming, Huntingdon, Union and Mifflin counties; and there is an efficient department of forestry under a state commissioner of forestry. A state forest academy (the only one in the United States) is at Mont Alto, where there is one of the three state nurseries; its first class graduated in 1906. In 1909 the state legislature passed an act authorizing any city, borough or township of the first class to acquire, subject to the approval of the commissioner of forestry, a municipal forest; and it authorized the distribution of seedling forest trees, at cost, to those who would plant and protect them, for growing private forests.

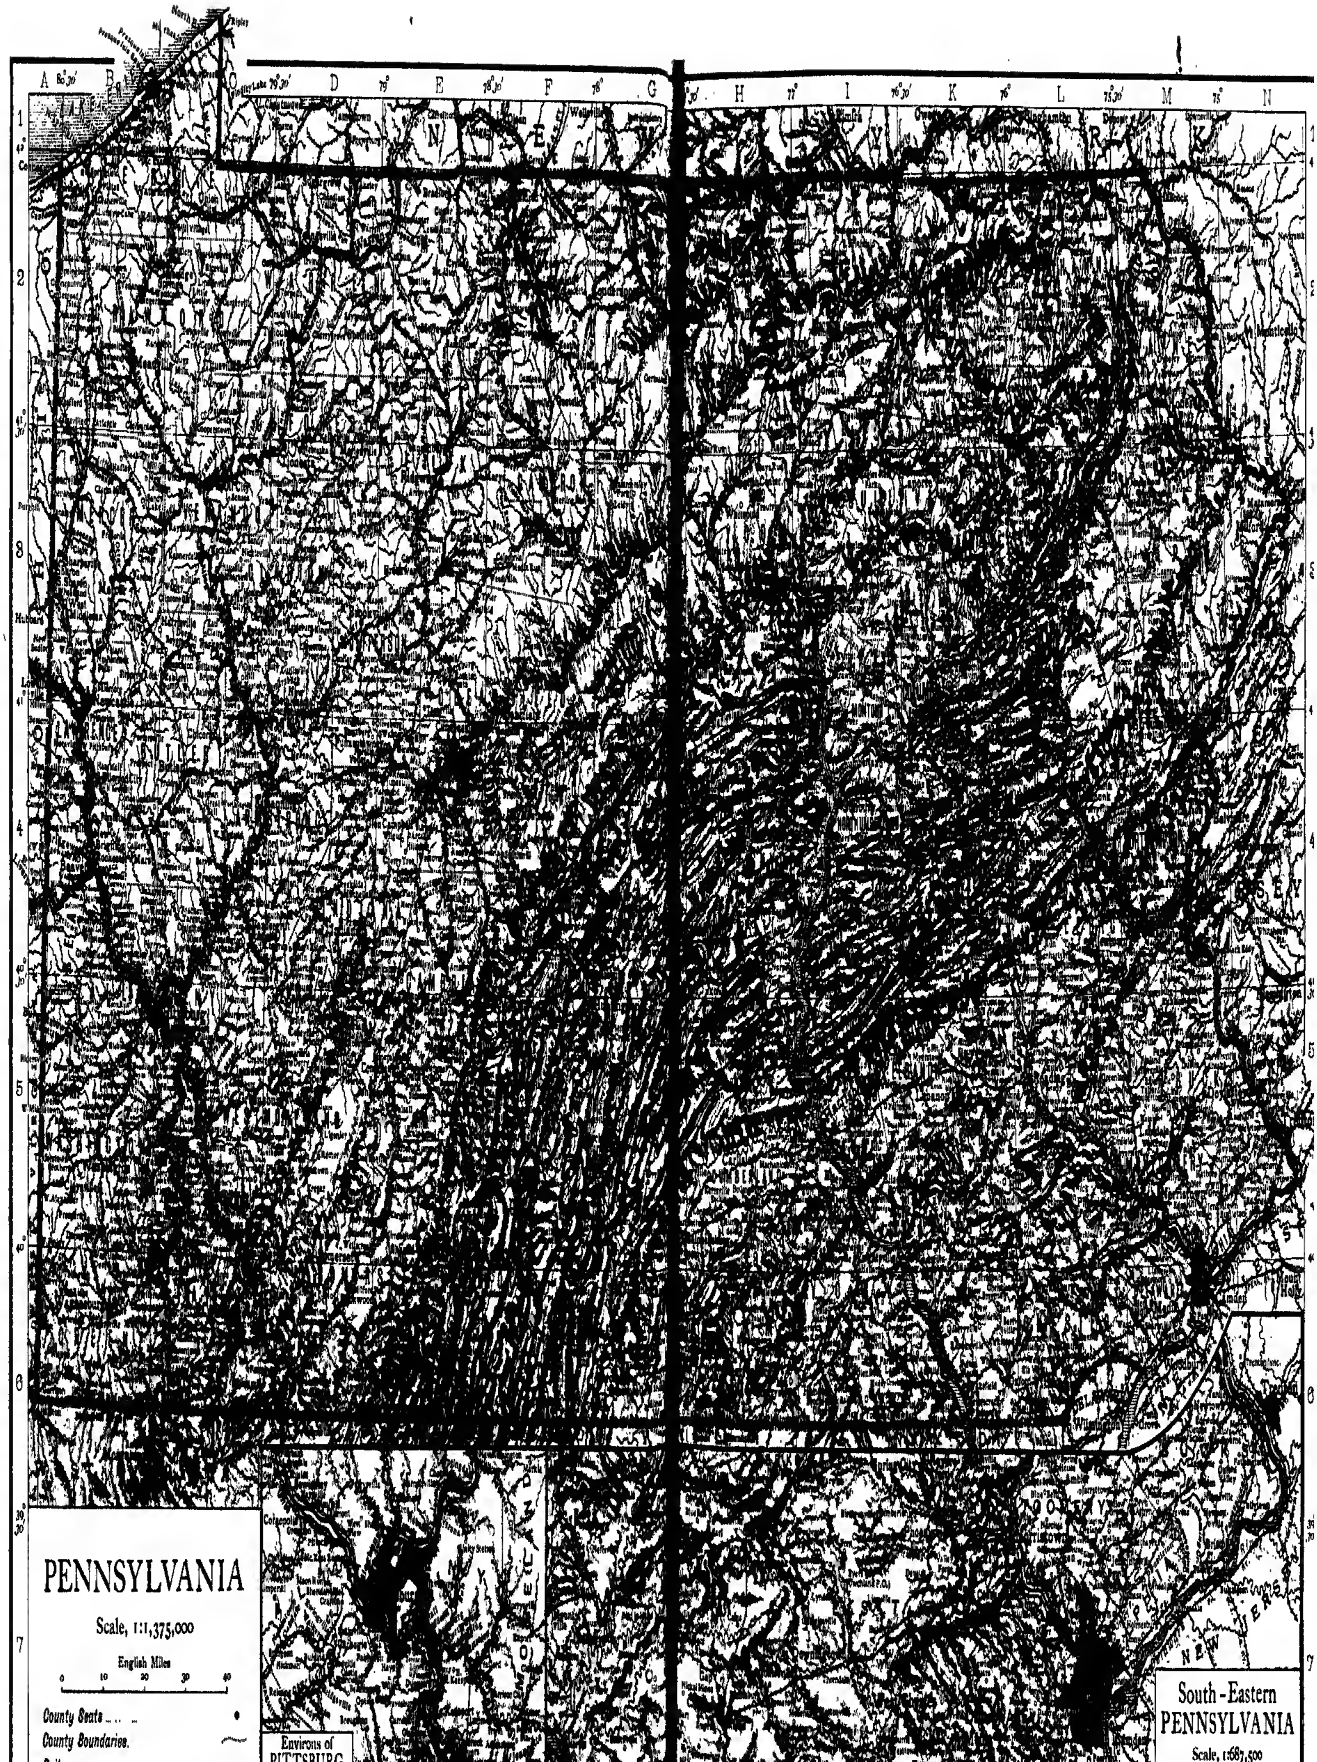
Climate.—The temperature is quite mild and equable in the south-east province where the ocean influences it and where the mountains bounding it on the north and north-west are some protection from the colder winds. The crests of the higher ridges in the central province are delightfully cool in summer, but the adjacent valleys are subject to excessive heat in summer and severe cold in winter. The mean annual temperature decreases to the north-westward on the Alleghany plateau, but on the Erie plain, in the extreme north-west, Lake Erie exerts its moderating influence, the mean temperature rises, and extremes shorten. The mean annual temperature in the south-east province is about 52° F.; it decreases to 50° in the central province and to 47° or less in some of the north-west counties of the Alleghany plateau, but rises to 49° on the shore of Lake Erie. At Philadelphia the mean temperature in winter (December, January and February) is 34°, the mean temperature in summer (June, July and August) is 74°, and the range of extremes here for a long period of years ending with 1907 was within 103° and 6°. At Huntingdon, Huntingdon county, in the Juniata Valley, the winter mean is 30°, the summer mean 71°, and within the period from 1888 to 1907 extremes ranged from 104° to 23°. The summer maxima on the mountains are usually 8° to 10° less than in the valleys directly below them; Saegerstown, Crawford county, is nearly 30 m. south of Erie, on Lake Erie, and yet the winter mean is 28° at Erie and only 25° at Saegerstown, and the lowest temperature on record for Erie is −16° while for Saegerstown it is −27°. During the period from 1875 to 1905 inclusive, extremes within the state ranged from 107° at York, York county, in July 1901, to −42° at Smithport, McKean county, in January 1904. July is the warmest month in all parts of the state. January is the coldest in some and February in others. The average annual rainfall is 44 in. It is 50 in. or more in some regions along the south-east border of the mountain district or farther south-east where the rains are occasionally heavy, and it is less than 40 in. in some of the north-east and south-west counties. The amount of rainfall during the summer is about 3 in. more than that during either autumn or winter and 2 in. more than that during spring. In the mountain region and in the vicinity of Lake Erie there is often a fall of several inches of snow during the winter months and the rapid melting of this produces floods on the Delaware, Susquehanna and Ohio rivers and some of their tributaries. The prevailing winds are westerly, but they are frequently interrupted by warm breezes from the south, or moisture-bearing currents from the east.

Soils.—The most productive soil is that in the south-east section of the Great Valley and in Chester Valley where it is derived largely from limestone. There is some of the same formation as well as that derived from red shales on the sandstone hills in the south-east province and in many of the middle and western valleys, but often a belt of inferior slate soil adjoins a limestone belt, and many of the ridges are covered with a still more sterile soil derived from white and grey sandstones. The north-west and north-east sections contain some glacial drift but the soil in these parts is not suitable for cultivation except in the larger valleys in the north-west where it is drained by glacial gravel or there is some sandy loam mixed with clay.

Agriculture.—Pennsylvania is noted for its mineral wealth and manufactures rather than for its agricultural resources, but in 1900 about two-thirds of its land was included in farms, a little more than two-thirds of its farm-land was improved, and in several crops the state has long ranked high. The number of farms increased from 127,577 in 1850 to 224,248 in 1900, the increase resulting in part from a reduction of their size but more largely from the appropriation of new lands for farming purposes. The average size in 1900 was 86·4 acres. Nearly 60 % of them contained less than 100 acres and only about 2·7 % contained 260 acres or more. More than seven-tenths (160,105) were worked by owners or part owners, and only 34,529 by share tenants, and 23,737 by cash tenants. Hay, Indian corn, wheat, oats, potatoes, fruits, vegetables and tobacco are the principal crops. Of the total crop acreage in 1899 nearly two-fifths was devoted to hay and forage, and the value of the hay crop in 1909[1] (when the crop was 3,742,000 tons, valued at $54,633,000) was greater than that of any other state in the Union except New York. Hay is grown in largest quantities in the north, and in the section south-east of Blue Mountain. More than one-half of the crop acreage in 1899 was devoted to cereals, and of the total cereal acreage 32 % was of wheat, 31·2 % was of Indian corn, 24·8 % was of oats, 6·5 % was of rye, and 5·3 % was of buckwheat. The product of Indian corn was 48,800,000 bushels in 1909; of wheat 26,265,000 bushels; of oats 25,948,000 bushels; of barley 196,000 bushels; of rye 5,508,000 bushels; and of buckwheat 5,665,000 bushels.

Indian corn, wheat and rye, are cultivated most extensively in the south-east counties. Some of the larger oat-producing counties also are in the south-east, but most of the buckwheat, barley and oats are grown in the north and west counties. The dairy business, for which much of the hay crop is needed, has grown with the growth of the urban population as is shown in part by a steady increase in the number of dairy cows from 530,224 in 1850 to 1,140,000 in 1910; the value of the dairy products in 1899 ($35,860,110) was exceeded only in New York. The number of other cattle has fluctuated somewhat, but there were 957,000 in 1910 as against 623,722 in 1850. Horses increased in number

[1] Statistics for 1909 and 1910 are from the *Year Book* of the United States Department of Agriculture.



Emery Walker

from 350,398 in 1850 to 619,000 in 1910. The number of mules increased steadily from 2259 in 1850 to 43,000 in 1910. The raising of sheep and swine was of considerably less relative importance in 1910 than in 1850, there being 1,882,357 sheep and 1,040,366 swine in 1850 and 1,112,000 sheep and 931,000 swine in 1910. The dairy business is largest in the regions around Philadelphia and Pittsburg, and in Erie and Bradford counties. Cattle other than dairy cows as well as horses and sheep are most numerous in the western counties, in Bradford county on the north border, and in some of the counties of the south-east. Swine are most numerous in the south-east and south-west counties. The state ranks high in the production of potatoes, cabbages, lettuce and turnips, and it produces large crops of sweet Indian corn, tomatoes, cucumbers, musk-melons, asparagus and celery. The total value of all vegetables produced in 1899 was $15,832,904, an amount exceeding that of any other state except New York. A large portion of the vegetables are grown in the vicinity of Philadelphia or in the vicinity of Pittsburg. The culture of tobacco, which was introduced as early as 1689, was a small industry until the middle of the 19th century, but it then developed rapidly except during a brief interruption caused by the Mexican War. In 1909 the crop was 30,732,000 lb. More than two-thirds of the state's crop of 1899 was produced in Lancaster county, which is one of the largest tobacco-producing counties in the United States, and most of the other third was produced in York, Tioga, Bradford and Clinton counties. Apples, cherries and pears are the principal orchard fruits. Grapes, peaches, plums and prunes, apricots, strawberries, raspberries and loganberries, blackberries and dewberries, currants and gooseberries are also grown. Orchard fruits are most abundant south-east of Blue Mountain, and small fruits near the larger cities, but about two-thirds of the grapes are grown in Erie county. Floriculture is an important industry in Philadelphia and its vicinity. The sale of nursery products, more than one-half of which were grown in Chester and Montgomery counties, amounted in 1899 to $541,032, and although this was less than one-third that of New York it was exceeded in only three other states.

Minerals.—Pennsylvania is by far the most important coal-producing state in the Union, and as much of the iron ore of the Lake Superior region is brought to its great bituminous coal-field for rendering into pig-iron, the value of the state's mineral products constitutes a large fraction of the total value for the entire country; in 1907, when the value of the mineral products of the state was $657,783,345, or nearly one-third that of all the United States, and in 1908 when the total for the state was $473,083,212, or more than one-fourth that of the whole United States, more than four-fifths of it was represented by coal and pig-iron. With the exception of two small areas in Colorado and New Mexico, Pennsylvania contains the only anthracite-coal region in the country. This is in the east of the state, and although it has a total area of about 3300 sq. m., its workable measures are mostly in Lackawanna, Luzerne, Carbon, Schuylkill and Northumberland counties in an area of less than 500 sq. m. This coal was discovered as early as 1762 near the site of the present city of Wilkes-Barré and during the War of Independence it was used at Carlisle in the manufacture of war materials, but it was of little commercial importance until early in the next century. In 1815 the output was reported as only 50 tons, but it steadily rose to 74,347,102 tons (valued at $158,178,849) in 1908. Besides having practically all the anthracite, Pennsylvania has the thickest bituminous coal-measures, and most of the coal obtained from these is of the best quality. They form the northern extremity of the great Appalachian coal-field and underlie an area of 15,000 sq. m. or more in the west of the state. The Pittsburg district, comprising the counties of Allegheny, Washington, Fayette and Westmoreland, is exceptionally productive, and the coal in Allegheny and Washington counties is noted for its gas-producing qualities, while in Fayette and Westmoreland counties is obtained the famous Connellsville coking coal. The bituminous coal was first used at nearly the same time as the anthracite and it was first shipped from Pittsburg in 1803. In 1840 the state's output was 464,826 tons. It increased to 1,000,000 tons in 1850, to 11,760,000 tons in 1875, to 79,842,326 tons in 1900, to 150,143,177 tons in 1907; and was 117,179,527 tons in 1908, when it was 35·2 % of that of the entire country and was valued at $118,816,303. In 1880 the output of coal (anthracite and bituminous) in Pennsylvania was 66 % of that of the entire country; in 1908 it was 48·2 %; but in the latter year the Pennsylvania mines produced more coal than the combined production of all the countries of the world excepting Great Britain, Germany and Austria-Hungary, and it was nearly four times as much as the total mined in Austria, nearly five times as much as that mined in France, and seven times as much as the output of Russia in that year. Extending from the south-west corner of the state through Greene, Washington, Allegheny, Beaver, Butler, Venango, Clarion, Forest, Elk, Warren, McKean and Tioga counties is the Pennsylvania section of the Appalachian oil-field which, with the small section in New York, furnished nearly all of the country's supply of petroleum for some years following the discovery of its value for illuminating purposes. The mineral was made known to white men by the Indians, who sold it, under the name of Seneca oil, as a cure for various ills, and burned it at some of their ceremonies. The early settlers in west Pennsylvania also found that some unknown people had dug pits several feet in depth around the oil springs apparently for the purpose of collecting the oil. But it was not until the middle of the 19th century that its value as an illuminating oil became known, and not until 1859 was the first petroleum well drilled. This was the Drake well, on the flats of Oil Creek at Titusville; it was about 70 ft. in depth, and when 25 barrels were pumped from it in a day its production was considered enormous. By the close of 1861 wells had been drilled from which 2000 to 3000 barrels flowed in a day without pumping, and the state's yearly output continued to increase until 1891, when it amounted to 31,424,206 barrels. Since then, however, wells have been going dry, and when, in 1895, the output fell to 19,144,390 barrels it was exceeded by that of Ohio. It went down quite steadily to 9,424,325 in 1908, and in that year Pennsylvania was out-ranked as an oil-producing state by Oklahoma, California, Illinois, Texas and Ohio. In drilling for some of the first oil wells gas escaped, and in a few instances this was used as a fuel for generating steam in the boilers of the drilling-engines. In some instances, too, wells which were drilled for oil produced only gas. A little later, about 1868, successful experiments were made with gas as a manufacturing fuel, and in 1872 the gas industry was fairly well established near Titusville by drilling a well and piping the gas for consumption both as fuel and light. The value of the state's output increased from approximately $75,000 in 1882 to approximately $19,282,000 in 1888, and the total value of its output during these and the intervening years was more than 80 % that of all the United States. The industry then became of greater importance in several other states and declined in Pennsylvania until in 1896 the value of Pennsylvania's product amounted to only $5,528,610, or 42·5 % of that of the United States. This temporary decline was, however, followed by a rather steady rise and in 1908 the output was valued at $19,104,944, which was still far in excess of that of any other state and nearly 35 % of that of the entire country. The gas region has an area of about 15,000 sq. m. and embraces about all of the Pennsylvania section of the Allegheny plateau except a narrow belt along its east and south-east border. There are deposits of various kinds of iron ore in the eastern, south-eastern, middle and some of the western counties, and from the middle of the 18th century until near the close of the 19th Pennsylvania ranked high among the iron-ore-producing states. As late as 1880 it ranked first, with a product amounting to 1,951,496 long tons. But the state's iron foundries moved rapidly westward after the first successful experiments in making pig-iron with bituminous coal, in 1845, and the discovery, a few years later, that rich ore could be obtained there at less cost from the Lake Superior region resulted in a decline of iron-mining within the state until, in 1902, the product amounted to only 822,932 long tons, 72·2 % of which was magnetite ore from the Cornwall mines in Lebanon county which have been among the largest producers of this kind of ore since the erection of the Cornwall furnace in 1742. In 1908 the entire iron-ore product of the state, amounting to 443,161 long tons, was not 1·3 % of that of the United States, but the production of the magnetite-ore alone (343,998 long tons) was more than one-fifth that of all the United States. In the manufacture of pig-iron Pennsylvania is easily first among the states, with a product value in 1908 of $111,385,000, nearly 43·8 % of that of the entire country. Pennsylvania has extensive areas of limestone rock suitable for making cement, and in Northampton and Lehigh counties enormous quantities of it are used in this industry. Natural-rock cement was first made in the state soon after the discovery, in 1831, of deposits of cement rock near Williamsport, Lycoming county, and the industry was greatly promoted in 1850 when the vast deposits in the lower Lehigh Valley were discovered and large quantities of cement were required in the rebuilding of the Lehigh Canal. Competition produced in Lehigh county the first successful Portland cement plant in the United States in 1870. The output of the natural-rock cement continued greater than that of the Portland until 1896, but for the succeeding ten years the enormous development of the cement industry was almost entirely in the Portland branch, its production in the state increasing from 825,054 barrels in 1896 to 8,770,454 barrels in 1902, and to 18,254,806 barrels (valued at $13,899,807) in 1908, when it was more than 30 % of that of the United States. The production of natural-rock cement was 608,000 barrels in 1896 and only 252,479 barrels (valued at $87,192) in 1908. Limestones and dolomites suitable for building purposes are obtained chiefly in Montgomery, Chester and Lancaster counties, and even these are generally rejected for ornamental work on account of their colour, which is usually bluish, grey or mottled. However, until increased facilities of transport brought more desirable stones into competition they were used extensively in Philadelphia and with them the main building of Girard College and the United States Naval Asylum were erected and the long rows of red-brick residences were trimmed. There are limestone quarries in nearly two-thirds of the counties and great quantities of the stone are used for flux in the iron furnaces, for making quicklime, for railway ballast and for road making. The total value of the limestone output in 1908 amounted to $4,057,471, and the total value of all stone quarried was $6,371,152. In Dauphin county is a quarry of bluish-brown Triassic sandstone that has been used extensively

especially in Philadelphia, for the erection of the so-called brown stone fronts. On the Pocono plateau is a large deposit of a fine-grained dark-blue stone of the Devonian formation which is known as the Wyoming Valley stone, and, like the New York "bluestone," which it closely resembles, is much used for window and door trimmings, steps and flagging. Several of the western counties contain Carboniferous or sub-Carboniferous sandstones that are used locally for building and for various other purposes. In 1908 the value of Pennsylvania sandstone and bluestone was $1,368,784. Northampton, Lehigh and York counties contain the most productive slate quarries in the country, and in 1908 the value of their output was $3,902,958; the Northampton and Lehigh slate is the only kind in the United States used for school blackboards. There is an extensive area in the south-east part of the state containing shale clay of a superior quality for making common brick. Kaolin abounds in Chester and Delaware counties, and fire-clay in several of the western counties. In 1908 the state ranked first in the value of its output of brick and tile ($18,981,743), which was 14·74 % of the entire product of the United States, and was second only to Ohio in the total value of its clay products ($14,842,982), which was 11·14 % of that for the entire country. Glass sand abounds both in the eastern and in the western sections and for many years Pennsylvania has used this more extensively in the manufacture of glass than any other state. Deposits of crystalline graphite are found in Chester and Berks counties. In Chester county, also, is one of the most productive deposits of feldspar, second in importance only to those of Maine. Soapstone is quarried in Montgomery and Northampton counties, phosphate rock, in Juniata county; rocks from which mineral paints are made, in several counties, and there is some garnet in Delaware county.

Manufactures.—The state ranks second to New York in the value of its manufactures, which increased from $155,044,910 in 1850 to $1,955,551,332 (factory products alone) in 1905, a growth which has been promoted by an abundance of fuel, by a good port on the Atlantic seaboard, by a network of canals which in the early years was of much importance in connecting the port with the Mississippi river system, by its frontage on Lake Erie which makes the ores of the Lake Superior region easily accessible, and by a great railway system which has been built to meet the demands arising from the natural resources. By far the most important industry is the production of iron and steel. The manufacture of iron was established on a commercial basis in 1716–1718, when a furnace was built on Manatawney Creek above Pottstown, and before the close of the colonial era Pennsylvania had risen to first rank among the iron-producing colonies, a position which it has always held among the states of the Union. So long as charcoal only was used in the furnaces (until about 1840) and during the brief period in which this was replaced largely by anthracite, the industry was of chief importance in the eastern section, but with the gradual increase in the use of bituminous coal, or of coke made from it, the industry moved westward, where, especially in the Pittsburg district, it received a new impetus by the introduction of iron ore from the Lake Superior region. The value of the output of iron and steel increased from $264,571,624 in 1890 to $471,228,844 in 1905, and the state furnished 46·5 % of the pig-iron and 54 % of the steel and malleable iron produced in the entire country. The manufacture of great quantities of coke has resulted from the demand for this product in the iron and steel industry and from the abundance of coking coal; the manufacture of glass has been promoted by the supply of glass sand and natural gas in the west of the state; the manufacture of leather by the abundance of hemlock bark; the manufacture of pottery, terra-cotta and fire-clay products by the abundance of raw material; the manufacture of silk and silk goods by the large number of women and girls who came into the state in families of which the men and boys were employed in mining and picking anthracite coal; and in each of these industries as well as in a few others the state has for many years produced a large portion of the country's product.

In 1905 the twelve leading manufactures, with the value of each, were: steel and malleable iron, $363,773,377; foundry and machine-shop products, consisting most largely of steam locomotives, metal-working machinery and pumping machinery, $119,650,913; pig-iron, $107,455,267; leather, $69,427,852; railway cars and repairs by steam railway companies, $61,021,374; refined petroleum, $47,459,504; silk and silk goods, $39,333,520; tobacco, cigars and cigarettes, $39,079,122; flour and grist-mill products, $38,518,702; refined sugar and molasses, $37,182,504; worsted goods, $35,683,015; and malt liquors, $34,863,823. The most marked advances from 1900 to 1905 were in worsted goods (61·4 %) structural iron-work (60 %), and tin and terne-plate (54·4 %). Philadelphia is the great manufacturing centre. Within its limits, in 1905, all the sugar and molasses were manufactured and much of the petroleum was refined, nearly all of the iron and steel ships and steam locomotives were built, and 95 % of the carpets and rugs were made, and the total value of the manufactures of this city in that year was nearly one-third of that for the entire state. Nearly 20 % of the iron and steel was produced by Pittsburg together with Allegheny, with which it has since been consolidated, and the production of these is the leading industry of New Castle, Johnstown, Duquesne, McKeesport, Sharon, Braddock and Dubois, also in the west part of the state and of Reading, Harrisburg, Steelton, South Bethlehem, Pottstown, Lebanon, Phoenixville and Danville in the east part. The silk and cement industries are confined largely to the eastern cities and boroughs; the coke, tin and terne-plate, and pickling industries to the western; and the construction and repair of railway cars to Altoona, Meadville, Dunmore, and repair of railway cars to Altoona, Meadville, Dunmore, Chambersburg, Butler and Philadelphia.

Transport and Commerce.—The new road cut through the Juniata region in the march of the army of Brigadier-General John Forbes, against Fort Duquesne in 1758, was a result of the influence of Pennsylvania, for it was considered even then a matter of great importance to the future prosperity of the province that its seaport, Philadelphia, be connected with navigation on the Ohio by the easiest line of communication that could be had wholly within its limits. As early as 1762 David Rittenhouse and others made a survey for a canal to connect the Schuylkill and the Susquehanna rivers, and in 1791 a committee of the state legislature reported in favour of a project for establishing communication by canals and river improvement from Philadelphia to Lake Erie by way of the Susquehanna river. Before anything was done, the need of improved means of transportation between Philadelphia and the anthracite coal-fields became the more pressing. The Schuylkill Canal Company, chartered in 1815, began the construction of a canal along the Schuylkill river from Philadelphia to Mount Carbon, Schuylkill county, in 1816, and completed it in 1826. In 1818 the Lehigh Navigation Company was formed to improve the navigation of the Lehigh river from its confluence with the Delaware to Coalport, and two years later coal was successfully carried down the Lehigh and Delaware rivers to Philadelphia in "arks" or rectangular boxes, two or more of which were joined together and steered by a long oar. So prosperous was the business that in 1827–1829 the company built a number of locks which made the Lehigh navigable in either direction, and in 1827–1832 the state did the same for the Delaware between the mouth of the Lehigh and Bristol. The Union Canal Company, incorporated in 1811, completed a canal from Middletown on the Susquehanna to Reading on the Schuylkill in 1827. In 1824 the state legislature authorized the appointment of a commission to explore routes from the Schuylkill to Pittsburg, and from the west branch of the Susquehanna to the Allegheny, and in the three or four succeeding years the state committed itself to a very extensive system of internal improvements. Work was begun on the system in 1826 and was continued without interruption until 1840, when the completed or nearly completed portions embraced a railway from Philadelphia to Columbia on the Susquehanna, a canal up the Susquehanna and the Juniata from Columbia to Hollidaysburg, a portage railway from Hollidaysburg through Blair's Gap in the Alleghany Front to Johnstown on the Conemaugh river, a canal down the Conemaugh, Kiskiminetas, and Allegheny rivers to Pittsburg, a canal up the Susquehanna and its west branch from the mouth of the Juniata to Farrandsville, in Clinton county, a canal up the Susquehanna and its north branch from Northumberland nearly to the New York border, and a canal up the Delaware river from Bristol to the mouth of the Lehigh; considerable work had also been done on two canals to connect the Ohio river with Lake Erie. Work was stopped, in 1840, before the system was completed because of the intense popular discontent arising from the burden of debt which had been assumed and because the success of competing railways was then fully assured. In 1845 the state began to sell its canals and railways to private corporations and the sale was completed in 1859. The western division of the system was abandoned by the new owners in 1865 and the worked portion of the east division gradually decreased until it, too, was wholly abandoned in 1904, with the exception of the Delaware Division Canal, which since 1866 has been worked by the Lehigh Coal and Navigation Company in connexion with the Lehigh Canal. In its natural condition there were bars in the Delaware river below Philadelphia which obstructed the navigation of vessels drawing more than 17–20 ft. of water, but in 1899 the Federal government adopted a project for obtaining a channel having a minimum depth of 30 ft. The Federal government has much improved the navigation of the Monongahela and Allegheny rivers and is committed to a project for slack-water navigation on the Ohio which is expected to give Pittsburg communication with the sea by vessels drawing 9 ft. of water.

The first railway in the state was that built in 1827 by the Lehigh Coal and Navigation Company from Mauch Chunk to its mines, 9 m. distant; but this was only a gravity road down which cars loaded with coal descended by their own gravity and up which the empty cars were drawn by mules. In 1823 a company was incorporated to build a railway from Philadelphia to Columbia, but nothing further was done until 1828, when the state canal commissioners were directed to build this road and the Allegheny Portage railway from Hollidaysburg to Johnstown. The latter was built with ten inclined planes, five on each side of the summit at Blair's Gap and cars were drawn up these by stationary engines. Both the Philadelphia & Columbia and the Allegheny Portage railways were completed in 1834. From these and other beginnings the state's railway mileage gradually increased to 1240 m. in 1850, to 4656 m. in 1870, to 8639 m. in 1890, and to 11,373 m. at

the end of 1908, when it was exceeded by only two states in the Union, Texas and Illinois. The principal railways are the lines operated by the Pennsylvania Railroad Company from New York to Washington through Philadelphia; from Philadelphia to Cincinnati, Cleveland, Chicago and St Louis through Harrisburg and Pittsburg; from Baltimore, Maryland, to Sodus Point on Lake Ontario (Northern Central) through Harrisburg and Williamsport; from Williamsport to Buffalo and to Erie, and from Pittsburg to Buffalo; the Philadelphia & Reading; the Lehigh Valley; the Erie; the Delaware, Lackawanna & Western; the Baltimore & Ohio; and the Buffalo, Rochester & Pittsburg.

The state has one port of entry along the Atlantic coast, one on the Ohio river, and one on the Great Lakes. Philadelphia, the Atlantic port, exports chiefly petroleum, coal, grain and flour, and imports chiefly iron ore, sugar, drugs and chemicals, manufactured iron, hemp, jute and flax. In 1909 the value of its exports, $80,650,274, was greater than that of any other Atlantic port except New York, and the value of its imports, $78,003,464, was greater than that of any except New York and Boston. Pittsburg ranks high among the interior ports of the country in foreign commerce and first among the cities of the United States in the tonnage of its domestic commerce. Erie is quite unimportant among the lake ports in foreign commerce, but has a large domestic trade in iron ore, copper, wheat and flour.

Population.—The population of Pennsylvania was 434,373 in 1790; 602,365 in 1800; 810,091 in 1810; 1,049,458 in 1820; 1,348,233 in 1830; 1,724,033 in 1840; 2,311,786 in 1850; 2,906,215 in 1860; 3,521,951 in 1870; 4,282,891 in 1880; 5,258,014 in 1890; and 6,302,115 in 1900. Of the total population in 1900, 985,250, or 15·6 %, were foreign-born, 156,845 were negroes, 1639 were Indians, 1927 were Chinese and 40 were Japanese. Nearly 95 % of the foreign-born was composed of natives of Germany (212,453), Ireland (205,909), Great Britain (180,670), Poland (76,358), Austria (67,492), Italy (66,655), Russia (50,959), Hungary (47,393) and Sweden (24,130). Of the native population (5,316,865) 90·7 % were born within the state and a little more than two-fifths of the remainder were natives of New York, Maryland, Ohio, New Jersey, Virginia, New England, Delaware and West Virginia. Almost two-thirds of the Indians were in Cumberland county, where, at Carlisle, is a United States Indian Industrial School. In 1906 the total number of communicants of different religious denominations in the state was 2,977,022, of whom 1,717,037 were Protestants and 1,214,734 were Roman Catholics. There is a large number of the smaller religious sects in the state; the principal denominations, with the number of communicants of each in 1906, are: Methodist (363,443), Lutheran (335,643), Presbyterian (322,542), Reformed Church (177,270), Baptist (141,694), Protestant Episcopalian (99,021), United Brethren (55,574), United Evangelical Church (45,480), Disciples of Christ (26,458), German Baptist Brethren (23,176), Eastern Orthodox Churches (22,123), Mennonites (16,527), Congregational (14,811), Evangelical Association (13,294), Friends (12,457), Church of God or "Winnebrennerians" (11,157), and Moravian (5322).

Of the total population in 1900, 3,223,337, or 51·1 %, were urban (*i.e.* in places having a population of 4000 or more), 762,846, or 12·15 %, were semi-urban (*i.e.* in incorporated places having a population less than 4000) and 2,315,932, or 36·75 %, were rural (*i.e.* outside of the incorporated places). From 1890 to 1900 the urban population increased 854,730, or 36 %, and the semi-urban 134,077, or 18·4 %, but the rural increased only 55,195, or 2·4 %. The populations of the principal cities in 1900 were as follow: Philadelphia, 1,293,697; Pittsburg, 321,616; Allegheny, 129,896 (subsequently annexed to Pittsburg); Scranton, 102,026; Reading, 78,96[illegible]; Erie, 52,733; Wilkes-Barré, 51,721; Harrisburg, 50,167; Lancaster, 41,459; Altoona, 38,973; Johnstown, 35,936; Allentown, 35,416; McKeesport, 34,227; Chester, 33,988; York, 33,708; Williamsport, 28,757; New Castle, 28,339; Easton, 25,238; Norristown, 22,265; Shenandoah, 20,321; Shamokin (borough), 18,202; Lebanon, 17,628.

Administration.—Pennsylvania has been governed under constitutions of 1776, 1790 and 1838; the present government is under the constitution of the 16th of December 1873 with amendments adopted on the 5th of November 1901. An amendment to the constitution to be adopted must be approved by a majority of the members elected to each house of the general assembly in two successive legislatures and then, at least three months after the second approval of the general assembly, by a majority of the popular vote cast on the adoption of the amendment. All male citizens over 21 years of age, who have been citizens of the United States for one month, residents of the state for one year and of the election district for two months immediately preceding the election, have the right of suffrage, provided they have paid within two years a state or county tax, which shall have been assessed at least two months and paid at least one month before the election. The Australian or "Massachusetts" ballot, adopted in 1891 under a law which fails to require personal registration, by a provision like that in Nebraska makes it easy to vote a straight ticket; party names are arranged on the ballot according to the number of votes secured by each party at the last preceding election.

Executive.—The office of governor, superseded in 1776 by a president and council of twelve, was restored in 1790. Under the present constitution the governor serves for four years and is ineligible for the next succeeding term. The governor and lieutenant-governor must be at least 30 years old, citizens of the United States, and inhabitants of the state for seven years last preceding election; no member of Congress or person holding any office under the United States or Pennsylvania may be governor or lieutenant-governor. The governor controls a large amount of patronage, appointing, subject to the advice and consent of two-thirds of the senate, a secretary of the commonwealth and an attorney-general during pleasure, and a superintendent of public instruction for four years, and may fill vacancies in various offices which occur during the recess of the senate. He has a right of veto, extending to items in appropriation bills, which may be overridden by a two-thirds vote in each house. His power of pardon is limited, being subject to the recommendation of three members of a board which consists of the lieutenant-governor, secretary of the commonwealth, attorney-general and secretary of internal affairs. The other executive officials are the lieutenant-governor and the secretary of internal affairs, elected for four years, the auditor-general, elected for three years, the treasurer, elected for two years, and (all appointed by the governor) the secretary of the commonwealth, the attorney-general and a superintendent of public instruction. All those chosen by election are ineligible for a second consecutive term except the secretary of internal affairs. The department of internal affairs consists of six bureaus: the land office, vital statistics, weather service, assessments, industrial statistics, and railroads, canals, telegraphs and telephones. There are also many statutory administrative officials and boards, such as the adjutant-general, insurance commissioner, board of health, board of agriculture, board of public grounds and buildings, commissioners of fisheries, and factory and mining inspectors.

Legislature.—During the colonial period and the early years of statehood the legislature was composed of one house, but the bicameral system was adopted in the constitution of 1790. There are fifty senators, elected for four years, and approximately two hundred representatives, elected for two years. Senators must be at least 25 years old, citizens and inhabitants of the state for four years next before election and inhabitants of the senatorial districts from which each is elected for one year next before election; representatives must be at least 21 years old and must have lived in the state three years and in the district from which elected one year next before election. To avoid the possibility of metropolitan domination provision is made that no city or county shall be entitled to more than one-sixth of the total number of senators. Sessions are biennial. The powers of the two houses are the same except that the senate exercises the usual right of confirming appointments and of sitting as a court of impeachment, while the House of Representatives initiates money bills and impeachment cases.

Judiciary.—The supreme court consists of seven judges elected by the voters of the state at large. Minority representation is secured by the provision that each elector shall vote for one less than the number of judges to be chosen at each election. The state is divided into three supreme judicial districts, the eastern, the middle and the western. This court was formerly very much overworked, but it was relieved by an act of the 24th of June 1895 establishing a superior court (now of seven judges) with appellate jurisdiction. There were in 1910 fifty-six district courts of common pleas, one for each county of forty thousand inhabitants and not more than four counties in a district. The judges of the common pleas are also judges of the courts of oyer and terminer, quarter sessions of the peace and general gaol delivery, and the orphans' courts, although there are separate orphans' courts in the counties (ten in 1909) having a population of more than one hundred and fifty thousand. Justices of the peace are elected in wards, districts, boroughs and townships. In the colonial period all judges were appointed by the governor during good behaviour. The constitution of 1776 provided for terms of seven years, that of 1790 restored the life term, and that of 1838 fixed the terms for judges of the common pleas at ten years and judges of the supreme court at fifteen. A constitutional amendment of 1850 provided that all judges should be elected by the people.[1]

[1] The constitution of 1873 made provision for minority representation as follows: "Whenever two judges of the supreme court are

At present supreme court judges serve for twenty-one years and are ineligible for re-election. Superior court and common pleas judges serve for ten years, and justices of the peace for five. Judges may be impeached for misdemeanour in office or they may be removed by the governor, with the consent of two-thirds of each house of the general assembly, for any reasonable cause which shall not be sufficient ground for impeachment.

Local Government.—The local government is a combination of the county system of the South and the township system of New England. The county officers are sheriffs, coroners, prothonotaries, registers of wills, recorders of deeds, commissioners, treasurers, surveyors, auditors or comptrollers, clerks of the courts, and district attorneys, elected for three years. The three commissioners and the three auditors in each county are chosen by the same limited vote process as the supreme-court judges, thus allowing a representation to the minority party. Pennsylvania has suffered more perhaps than any other state in the Union from legislative interference in local affairs. Under an act of the general assembly passed in 1870 the people of Philadelphia were forced to contribute more than $20,000,000 for the construction of a city-hall. To guard against such encroachments in the future the constitution of 1873 imposed the most detailed limitations upon special legislation. The object of the provision, however, has been in a large measure nullified by the system of city classification, under which Philadelphia is the only city of the first class. The passage of the "Ripper Bill" of 1901 shows that the cities of the second class are by no means secure. The apparent object of the measure was to deprive the people of Pittsburg temporarily of the privileges of self-government by empowering the governor to appoint a recorder (in 1903 the title of mayor was again assumed) to exercise (until 1903, when the municipal executive should be again chosen by the people) the functions of the mayor, thus removed by the governor under this statute; and this act applied to the other cities of the second class, Allegheny and Scranton, although they had not offended the party managers.

Miscellaneous Laws.—A woman's right to hold, manage and acquire property in her own right is not affected by marriage, but for a married woman to mortgage or convey her real estate the joint action of herself and her husband is necessary. The rights of dower and courtesy both obtain. When a husband dies intestate leaving a widow and issue, the widow has the use of one-third of his real estate for life and one-third of his personal estate absolutely; if he leaves no issue but there be collateral heirs or other kindred, the widow has the real or personal estate or both to the value of $5000, the use of one-half the remaining real estate for life, and one-half the remaining personal estate absolutely; if the husband leaves a will the widow has the choice between her dower right and the terms of the will. When a wife dies intestate leaving a husband and issue the husband has the use of all her real estate for life, and the personal estate is divided among the husband and children share and share alike; if there be no issue the husband has the use of all her real estate for life and all her personal estate absolutely; if the wife leaves a will the husband has the choice between its terms and his right by courtesy. Whenever there is neither issue nor kindred the surviving husband or wife has all the estate. The principal grounds for an absolute divorce are impotency, adultery, wilful or malicious desertion, cruel and barbarous treatment, personal abuse and conviction of any such crime as arson, burglary, embezzlement, forgery, kidnapping, larceny, murder, perjury or assault with intent to kill. Before filing a petition for a divorce the plaintiff must have resided within the state at least one year. A suit for a divorce on the ground of desertion may be commenced when the defendant has been absent six months, but the divorce may not be granted until the desertion has continued two years. The party convicted of adultery is forbidden to marry the co-respondent during the lifetime of the other party. A marriage of first cousins or a bigamous marriage may be declared void. Pennsylvania has no homestead law, but the property of a debtor amounting to $300 in value, exclusive of the wearing apparel of himself and family and of all Bibles and school-books in use, is exempt from levy and sale on execution or by distress for rent; and the exemption extends to the widow and children unless there is a lien on the property for purchase money. The child-labour law of 1909 forbids the employment of children under eighteen years of age in blast furnaces, tanneries, quarries, in managing elevator lifts or hoisting machines, in oiling dangerous machinery while in motion, at switch tending, as brakesmen, firemen, engineers, motormen and in other positions of similar character. The same law prescribes conditions under which children between fourteen and eighteen years of age may be employed in the manufacture of white-lead, red-lead, paints, phosphorus, poisonous acids, tobacco or cigars, in mercantile establishments, stores, hotels, offices or in other places requiring protection to their health or safety; and it forbids the employment of boys under sixteen years of age or of girls under eighteen years of age in such factories or establishments more than ten hours a day (unless it be to prepare for a short day) or for more than fifty-eight hours a week, or their employment there between nine o'clock in the evening and six o'clock in the morning, except that in the factories requiring continuous night and day employment boys not under fourteen years of age may be employed partly by day and partly by night not exceeding nine hours in any twenty-four. The employment of children under fourteen years of age in coal-mines is forbidden, as is also the employment of children under fourteen years of age in any cotton, woollen, silk, paper, bagging or flax factory, or in any laundry, or the employment of children under twelve years of age in any mill or factory whatever within the commonwealth.

Prisons and Charities.—Penal and charitable institutions are under the supervision of a board of public charities of ten members, established in 1869, and a committee in lunacy, composed of five members of this board, appointed under an act of 1883. An agitation begun by the Philadelphia society for assisting distressed prisoners in 1776, checked for a time by the War of Independence, led ultimately to the passage of a statute in 1818 for the establishment of the Western Penitentiary at Allegheny (opened 1826) and another of 1821 for the establishment of the Eastern Penitentiary in Philadelphia (opened 1829). In the former penitentiary prisoners are congregated; in the latter they are kept in solitary confinement. An act of 1878 provided for a third penitentiary in the middle district, but through the efforts of Governor Henry M. Hoyt the plans were changed and instead the Industrial Reformatory was established at Huntingdon (opened 1889). The House of Refuge of western Pennsylvania, located in Allegheny in 1854 (act of 1850), became the Pennsylvania Reform School in 1872, and was removed to Morganza, Washington county, in 1876. Few states have done so much as Pennsylvania for the humane and scientific treatment of its dependent and defective classes. Largely as a result of the efforts of Dorothea Lynde Dix (*q.v.*), a hospital for the insane was established at Harrisburg in 1851 (act of 1845). A second hospital was opened at Pittsburg in 1853 (act of 1848), but the location was ruined by Pennsylvania railway improvements, and in 1862 it was removed to a new site about 7 m. from the city, which was called Dixmont in honour of Miss Dix; the hospital is not a state institution, but the state provides for the maintenance there of patients committed by the courts or the poor authorities in the thirteen counties forming the western district. For three other districts three state institutions have been established—at Danville, 1872 (act of 1868), Warren, 1880 (act of 1873), and Norristown, 1880 (act of 1876). An act of 1901 established a homoeopathic hospital for the insane at Allentown. A distinction is made between hospitals and asylums. The asylum for the chronic insane is at South Mountain, 1894 (act of 1891). A state institution for feeble-minded of western Pennsylvania at Polk, Venango county, was opened in 1897 (act of 1893), and the eastern Pennsylvania state institution for feeble-minded and epileptic at Spring City, Chester county, was opened in 1908 (act of 1903). There are institutes for the blind at Overbrook and Pittsburg, and for the deaf and dumb at Philadelphia and Edgewood Park, an oral school for the deaf at Scranton, a home for the training of deaf children at Philadelphia, a soldiers' and sailors' home at Erie (1886), a soldiers' orphans' industrial school (1895) at Scotland, Franklin county, the Thaddeus Stevens industrial school (1905) at Lancaster, hospitals for the treatment of persons injured in the mines, at Ashland (1879), Hazleton (1887) and Shamokin (1907), and cottage hospitals at Blossburg, Connellsville, Mercer and Philipsburg (all 1887). In addition to the institutions under state control a large number of local charities receive aid from the public treasury. In 1907–1908, $14,222,440 was appropriated for institutions: $7,479,732 for state institutions, $1,240,108 for semi-state institutions, $4,757,100 for general hospitals, $149,500 for hospitals for consumptives, and $745,900 for homes, asylums, &c. The system of juvenile courts, created under a statute of 1901, has done much to ameliorate the condition of dependent and delinquent children.

Education.—During the colonial period there were many sectarian and neighbourhood subscription schools in which the poor could receive a free education, but public schools in the modern American sense were unknown. The famous Friends' public school, founded in Philadelphia in 1689 and chartered in 1697, still exists as the William Penn charter school. An agitation begun soon after the War of Independence resulted in the creation of a school fund in 1831 and the final establishment of the present system of public schools in 1834. The attempt to repeal the law in 1835 was defeated largely through the efforts of Thaddeus Stevens, who was then a member of the state house of representatives. During the years 1852–1857 the educational department became a separate branch of the state government, the office of county school superintendent was created, the state teachers' association (known since 1900 as the Pennsylvania educational association) was organized, and a law was enacted for the establishment of normal schools. Since 1893 the state has furnished textbooks and other necessary supplies free of charge, and since 1895 education has been compulsory for all children between the ages of eight and thirteen. Schools must be kept open not less than seven and not more than ten months in the year. Out of a total expenditure of $30,021,774 for the fiscal year 1909, $7,875,083 was for educational purposes, of which $6,810,906 was for common schools, being appropriations to the

to be chosen for the same term of service each voter shall vote for one only, and when three are to be chosen he shall vote for no more than two; candidates highest in vote shall be declared elected."

counties. There is a biennial school appropriation of $15,000,000. In addition the district directors levy local rates which must not be greater than the state and county taxes combined. The Pennsylvania state college at State College, Center county, was established in 1855 as the farmers' high school of Pennsylvania, in 1862 became the Agricultural College of Pennsylvania, and received its present name in 1874 after the income from the national land grant had been appropriated to the use of the institutions; in 1909–1910 it had 147 instructors, 1400 students and a library of 37,000 volumes. Other institutions for higher education are the university of Pennsylvania, at Philadelphia (1749), an endowed institution which receives very little support from the state; the Western University of Pennsylvania (1819), at Pittsburg; Dickinson College (Methodist Episcopal, 1783), at Carlisle; Haverford College (Society of Friends, 1833), at Haverford; Franklin and Marshall (German Reformed, 1853), at Lancaster; Washington and Jefferson (Presbyterian, 1802), at Washington; Lafayette (Presbyterian, 1832), at Easton; Bucknell University (Baptist, 1846), at Lewisburg; Waynesburg (Cumberland Presbyterian, 1851), at Waynesburg; Ursinus (German Reformed, 1870), at Collegeville; Allegheny College (Methodist Episcopal, 1815), at Meadville; Swarthmore (Society of Friends [Hicksites], 1866), at Swarthmore; Muhlenberg (Lutheran, 1867), at Allentown; Lehigh University (non-sectarian, 1867), at Bethlehem; and for women Bryn Mawr College (Society of Friends, 1885), at Bryn Mawr; the Allentown College (German Reformed, 1867), at Allentown; Wilson College (Presbyterian, 1870), and the Pennsylvania College for women (1869), at Pittsburg. There are theological seminaries at Pittsburg, the Allegheny Seminary (United Presbyterian, 1825), Reformed Presbyterian (1856), and Western Theological Seminary (Presbyterian, 1827); at Lancaster (German Reformed, 1827); at Meadville (Unitarian, 1844); at Bethlehem (Moravian, 1807); at Chester, the Crozer Theological Seminary (Baptist, 1868); at Gettysburg (Lutheran, 1826); and in Philadelphia several schools, notably the Protestant Episcopal Church divinity school (1861) and a Lutheran seminary (1864), at Mount Airy. There are many technical and special schools, such as Girard College, Drexel institute and Franklin institute at Philadelphia, the Carnegie institute at Pittsburg and the United States Indian school at Carlisle (1891).

Finance.—The revenues of the state are derived primarily from corporation taxes, business licences, and a 5 % rate on collateral inheritance. Taxes on real estate have been abolished and those on personal property are being reduced, although the heavy expenditures on the new capitol at Harrisburg checked the movement temporarily. The total receipts for the year ending on the 30th of November 1909 were $28,945,210, and the expenditure was $30,021,774. During the provincial period Pennsylvania, in common with the other colonies, was affected with the paper money craze. From 1723 to 1775 it issued £1,094,650 and from 1775 to 1785 £1,172,000 plus $1,550,000. Acts were passed in 1781, 1792, 1793 and 1794 to facilitate redemption at depreciated rates, and the last bills were called in on the 1st of January 1806. The state was also carried along by the movement which began about 1825 for the expenditure of public funds on internal improvements. On turnpikes, bridges, canals and railways $53,352,649 was spent between 1826 and 1843, the public debt in the latter year reaching the high-water mark of $42,188,434. An agitation was then begun for retrenchment, the public works were put up for sale, and were finally disposed of in 1858 (when the debt was $39,488,244) to the Pennsylvania Railroad Company for $7,500,000. Under authority of a constitutional amendment of 1857 a sinking fund commission was established in 1858. Aside from a temporary increase during the Civil War (1861–65) the debt has been rapidly reduced. The constitution of 1873 and subsequent legislation have continued the commission, but the sources of revenue have been very much curtailed, being restricted to the interest on the deposits of the fund and interest on certain Allegheny Railroad bonds. The total debt on the 30th of November 1909 was $2,643,917, of which the greater part were 3½ and 4 % bonds, maturing on the 1st of February 1912. The sinking fund at the same date amounted to $2,652,035, leaving a net surplus in the sinking fund of $8118. The sinking fund was formerly divided among certain favoured banks in such manner as would best advance the political interests of the organization which controlled the state; but just after the reform victory in the election of 1905 the sinking fund commission instituted the policy of buying bonds at the market price, and the debt is now being reduced by that method. The financial institutions of Pennsylvania other than national banks are created by state charters limited to twenty years and are subject to the supervision of a commissioner of banking.

History.—The chief features of Pennsylvania history in colonial days were the predominance of Quaker influence, the heterogeneous character of the population, liberality in matters of religion, and the fact that it was the largest and the most successful of proprietary provinces. The earliest European settlements within the present limits of the state were some small trading posts established by the Swedes and the Dutch in the lower valley of the Delaware River in 1623–1681. Between 1650 and 1660 George Fox and a few other prominent members of the Society of Friends had begun to urge the establishment of a colony in America to serve as a refuge for Quakers who were suffering persecution under the "Clarendon Code." William Penn (*q.v.*) became interested in the plan at least as early as 1666. For his charters of 1680–1682 and the growth of the colony under him see PENN, WILLIAM.

During Penn's life the colony was involved in serious boundary disputes with Maryland, Virginia and New York. A decree of Lord Chancellor Hardwicke, in 1750, settled the Maryland-Delaware dispute and led to the survey in 1763–1767 of the boundary between Pennsylvania and Maryland (lat. 39° 43′ 26·3″ N.), called the Mason & Dixon line in honour of the surveyors; it acquired considerable importance later as separating the free and the slave states. In 1784 Virginia agreed to the extension of the line and to the establishment of the western limit (the present boundary between Pennsylvania and Ohio) as the meridian from a point on the Mason & Dixon line 5° of longitude west of the Delaware River. The 42nd parallel was finally selected as the northern boundary in 1789, in 1792 the Federal government sold to Pennsylvania the small triangular strip of territory north of it on Lake Erie. A territorial dispute with Connecticut over the Wyoming Valley was settled in favour of Pennsylvania in 1782 by a court of arbitration appointed by the Continental Congress.

Upon William Penn's death, his widow became proprietary. Sir William Keith, her deputy, was hostile to the council, which he practically abolished, and was popular with the assembly, which he assiduously courted, but was discharged by Mrs Penn after he had quarrelled with James Logan, secretary of the province. His successors, Patrick Gordon and George Thomas, under the proprietorship of John, Thomas and Richard Penn, continued Keith's popular policy of issuing a plentiful paper currency; but with Thomas the assembly renewed its old struggle, refusing to grant him a salary or supplies because of his efforts to force the colony into supporting the Spanish War. Again, during the Seven Years' War the assembly withstood the governor, Robert Hunter Morris, in the matter of grants for military expenses. But the assembly did its part in assisting General Braddock to outfit; and after Braddock's defeat all western Pennsylvania suffered terribly from Indian attacks. After the proprietors subscribed £5000 for the protection of the colony the assembly momentarily gave up its contest for a tax on the proprietary estates and consented to pass a money bill, without this provision, for the expenses of the war. But in 1760 the assembly, with the help of Benjamin Franklin as agent in England, won the great victory of forcing the proprietors to pay a tax (£566) to the colony; and thereafter the assembly had little to contest for, and the degree of civil liberty attained in the province was very high. But the growing power of the Scotch-Irish, the resentment of the Quakers against the proprietors for having gone back to the Church of England and many other circumstances strengthened the anti-proprietary power, and the assembly strove to abolish the proprietorship and establish a royal province; John Dickinson was the able leader of the party which defended the proprietors; and Joseph Galloway and Benjamin Franklin were the leaders of the anti-proprietary party, which was greatly weakened at home by the absence after December 1764 of Franklin in England as its agent. The question lost importance as independence became the issue.

In 1755 a volunteer militia had been created and was led with great success by Benjamin Franklin; and in 1756 a line of forts was begun to hold the Indians in check. In the same year a force of pioneers under John Armstrong of Carlisle surprised and destroyed the Indian village of Kittanning (or Atiqué) on the Allegheny River. But the frontier was disturbed by Indian attacks until the suppression of Pontiac's conspiracy. In December 1763 six Christian Indians, Conestogas, were massacred by the "Paxton boys" from Paxton near the present Harrisburg; the Indians who had escaped were taken

to Lancaster for safe keeping but were seized and killed by the "Paxton boys," who with other backwoodsmen marched upon Philadelphia early in 1764, but Quakers and Germans gathered quickly to protect it and civil war was averted, largely by the diplomacy of Franklin. The Paxton massacre marked the close of Quaker supremacy and the beginning of the predominance of the Scotch-Irish pioneers.

Owing to its central position, its liberal government, and its policy of religious toleration, Pennsylvania had become during the 18th century a refuge for European immigrants, especially persecuted sectaries. In no other colony were so many different races and religions represented. There were Dutch, Swedes, English, Germans, Welsh, Irish and Scotch-Irish; Quakers, Presbyterians, Episcopalians, Catholics, Lutherans (Reformed), Mennonites, Dunkers, Schwenkfelders, and Moravians. Most of these elements have now become merged in the general type, but there are still many communities in which the popular language is a corrupt German dialect, largely Rheno-Franconian in its origin, known as "Pennsylvania Dutch." Before the Seven Years' War the Quakers dominated the government, but from that time until the failure of the Whisky Insurrection (1794) the more belligerent Scotch-Irish (mostly Presbyterians) were usually in the ascendancy, the reasons being the growing numerical strength of the Scotch-Irish and the increasing dissatisfaction with Quaker neglect of means of defending the province.

As the central colony, Pennsylvania's attitude in the struggle with the mother country was of vast importance. The British party was strong because of the loyalty of the large Church of England element, the neutrality of many Quakers, Dunkers, and Mennonites, and a general satisfaction with the liberal and free government of the province, which had been won gradually and had not suffered such catastrophic reverses as had embittered the people of Massachusetts, for instance. But the Whig party under the lead of John Dickinson, Thomas Mifflin and Joseph Reed was successful in the state, and Pennsylvania contributed greatly to the success of the War of Independence, by the important services rendered by her statesmen, and, more tangibly, by the financial aid to the cause given by Robert Morris (*q.v.*). The two Continental Congresses (1774, and 1775–1781) met in Philadelphia, except for the months when Philadelphia was occupied by the British army and Congress met in Lancaster, Pennsylvania, and then in Princeton, New Jersey. It was in Philadelphia that the second Congress adopted the Declaration of Independence, which the Pennsylvania delegation, excepting Franklin, thought premature at the time, but which was well supported by Pennsylvania afterwards. During the War of Independence battles were fought at Brandywine (1777), Paoli (1777), Fort Mifflin (1777) and Germantown (1777), and Washington's army spent the winter of 1777–1778 at Valley Forge; and Philadelphia was occupied by the British from the 27th of September 1777 to the 18th of June 1778. The Penns lost their governmental rights in 1776, and three years later their territorial interests were vested in the commonwealth in return for a grant of £120,000 and the guarantee of titles to private estates held in severalty. They still own considerable property in and around Wilkes-Barré, in Luzerne county, and in Philadelphia. The first state constitution of September 1776 was the work of the Radical party. It deprived the Quakers of their part in the control of the government and forced many Conservatives into the Loyalist party. This first state constitution was never submitted to popular vote. It continued the unicameral legislative system, abolished the office of governor, and provided for an executive council of twelve members. It also created a curious body, known as the council of censors, whose duty it was to assemble once in seven years to decide whether there had been any infringements of the fundamental law. The party which had carried this constitution through attacked its opponents by withdrawing the charter of the college of Philadelphia (now the university of Pennsylvania) because its trustees were anti-Constitutionalists and creating in its place a university of the state of Pennsylvania. The Constitutional party in 1785 secured the annulment by the state assembly of the charter of the Bank of North America, which still retained a congressional charter; and the cause of this action also seems to have been party feeling against the anti-Constitutionalists, among whom Robert Morris of the bank was a leader, and who, especially Morris, had opposed the paper money policy of the constitutionalists. These actions of the state assembly against the college and the bank probably were immediate causes for the insertion in the Federal Constitution (adopted by the convention in Philadelphia in 1787) of the clause (proposed by James Wilson of Pennsylvania, a friend of the college and of the bank) forbidding any state to pass a law impairing the obligation of contracts. The state ratified the Federal Constitution, in spite of a powerful opposition—largely the old (state) constitutional party—on the 22nd of December 1787, and three years later revised its own constitution to make it conform to that document. Under the constitution of 1790 the office of governor was restored, the executive council and the council of censors were abolished, and the bicameral legislative system was adopted. Philadelphia was the seat of the Federal government, except for a brief period in 1789–1790, until the removal to Washington in 1800. The state capital was removed from Philadelphia to Lancaster in 1799 and from Lancaster to Harrisburg in 1812.

The state was the scene of the Scotch-Irish revolt of 1794 against the Federal excise tax, known as the Whisky Insurrection (*q.v.*) and of the German protest (1799) against the house tax, known as the Fries Rebellion from its leader John Fries (*q.v.*). In 1838 as the result of a disputed election to the state house of representatives two houses were organized, one Whig and the other Democratic, and there was open violence in Harrisburg. The conflict has been called the "Buckshot War." The Whig House of Representatives gradually broke up, many members going over to the Democratic house, which had possession of the records and the chamber and was recognized by the state Senate. Pennsylvania was usually Democratic before the Civil War owing to the democratic character of its country population and to the close commercial relations between Philadelphia and the South. The growth of the protectionist movement and the development of anti-slavery sentiment, however, drew it in the opposite direction, and it voted the Whig national ticket in 1840 and in 1848, and the Republican ticket for Lincoln in 1860. A split among the Democrats in 1835, due to the opposition of the Germans to internal improvements and to the establishment of a public school system, resulted in the election as governor of Joseph Ritner, the anti-Masonic candidate. The anti-Masonic excitement subsided as quickly as it had risen, and under the leadership of Thaddeus Stevens the party soon became merged with the Whigs. During the Civil War (1861–65) the state gave to the Union 336,000 soldiers; and Generals McClellan, Hancock, Meade and Reynolds and Admirals Porter and Dahlgren were natives of the state. Its nearness to the field of war made its position dangerous. Chambersburg was burned in 1862; and the battle of Gettysburg (July 1863), a defeat of Lee's attempt to invade the North in force was a turning point in the war.

The development of the material resources of the state since 1865 has been accompanied by several serious industrial disturbances. The railway riots of 1877, which centred at Pittsburg and Reading, resulted in the destruction of about two thousand freight cars and a considerable amount of other property. An organized association, known as the Molly Maguires (*q.v.*), terrorized the mining regions for many years, but was finally suppressed through the courageous efforts of President Franklin Benjamin Gowen (1863–1889) of the Philadelphia & Reading railroad, with the assistance of Allan Pinkerton and his detectives. There have been mining strikes at Scranton (1871), in the Lehigh and Schuylkill regions (1875), at Hazleton (1897), and one in the anthracite fields (1902) which was settled by a board of arbitrators appointed by President Roosevelt; and there were street railway strikes at Chester in 1908 and in Philadelphia in 1910. The calling in of Pinkerton detectives from Chicago and New

York to settle a strike in the Carnegie steel works at Homestead in 1892 precipitated a serious riot, in which about twenty persons were killed. It was necessary to call out the entire organized militia of the state before the disorder was finally suppressed. The labour unions took advantage of this trouble to force Pennsylvania, Indiana, Illinois, Minnesota, Colorado and several other states to pass anti-Pinkerton statutes making it illegal to import irresponsible armed men from a distance to quell local disturbances. On the political side the chief features in the history of the state since 1865 have been the adoption of the constitution of 1873, the growth of the Cameron-Quay-Penrose political machine, and the attempts of the reformers to overthrow its domination. The constitution of 1838, which superseded that of 1790, extended the functions of the legislature, limited the governor's power of appointment, and deprived negroes of the right of suffrage. The provision last mentioned was nullified by the fourteenth and fifteenth amendments to the constitution of the United States. The chief object of the present state constitution (1873) was to prohibit local and special legislation. It increased the number of senators and representatives, created the office of lieutenant-governor, substituted biennial for annual sessions of the legislature, introduced minority representation in the choice of the higher judiciary and of the county commissioners and auditors and provided (as had an amendment adopted in 1850) for the election of all judges by popular vote. The political organization founded by Simon Cameron (*q.v.*) and strengthened by his son, James Donald Cameron, Matthew Stanley Quay and Boies Penrose (b. 1860), is based upon the control of patronage, the distribution of state funds among favoured banks, the support of the Pennsylvania railway and other great corporations, and upon the ability of the leaders to persuade the electors that it is necessary to vote the straight Republican ticket to save the protective system. Robert E. Pattison (1850–1904), a Democrat, was elected governor in 1883 and again in 1891, but he was handicapped by Republican legislatures. In 1905 a Democratic state treasurer was elected.

PENNSYLVANIA GOVERNORS.

Under Dutch Rule (1624–1664).[1]

Cornelis Jacobsen Mey	Director	1624–1625
William van Hulst	„	1625–1626
Peter Minuit	Governor	1626–1632
David Pieterzen de Vries	„	1632–1633
Wouter van Twiller	„	1633–1638
William Kieft	„	1638–1647
Peter Stuyvesant	„	1647–1664

Under Swedish Rule (1638–1655).[2]

Peter Minuit		1638–1641
Peter Hollender		1641–1642
John Printz		1642–1653
John Pappegoya		1653–1654
John Claude Rysingh		1654–1655

Under the Duke of York (1664–1673).

Richard Nicolls		1664–1667
Robert Carr	Deputy	1664–1667
Robert Needham	Commander on the Delaware	1664–1668
Francis Lovelace		1667–1673
John Carr	Commander on the Delaware	1668–1673

Under Dutch Rule (1673–1674).

Anthony Colve		1673–1674
Peter Alrichs	Deputy on the Delaware	1673–1674

Under the Duke of York (1674–1681).

Sir Edmund Andros		1674–1681

Under the Proprietors (1681–1693).

William Markham	Deputy-Governor	1681–1682
William Penn		1682–1684
Thomas Lloyd	President of the Council	1684–1686
Thomas Lloyd, Robert Turner, Arthur Cook, John Simcock, John Eckley	Executive Commissioners	1686–1688
John Blackwell	Deputy-Governor	1688–1690
Thomas Lloyd	President of the Council	1690–1691
Thomas Lloyd	Deputy-Governor	1691–1693
William Markham[3]	„	1691–1693

Under the Crown (1693–1695).

Benjamin Fletcher		1693–1695
William Markham	Deputy-Governor	1693–1695

Under the Proprietors (1695–1776).

William Markham	Deputy-Governor	1695–1699
William Penn		1699–1701
Andrew Hamilton	Deputy-Governor	1701–1703
Edward Shippen	President of the Council	1703–1704
John Evans	Lieutenant-Governor	1704–1709
Charles Gookin	„	1709–1717
Sir William Keith	„	1717–1726
Patrick Gordon	„	1726–1736
James Logan	President of the Council	1736–1738
George Thomas	Deputy-Governor	1738–1747
Anthony Palmer	President of the Council	1747–1748
James Hamilton	Lieutenant-Governor	1748–1754
Robert H. Morris	Deputy-Governor	1754–1756
William Denny	Lieutenant-Governor	1756–1759
James Hamilton	„	1759–1763
John Penn	„	1763–1771
James Hamilton	President of the Council	1771
Richard Penn	Lieutenant-Governor	1771–1773
John Penn	„	1773–1776

Period of Statehood (1776–).

Benjamin Franklin	Chairman of the Committee of Safety	1776–1777
Thomas Wharton, Jr.	President of the Council	1777–1778
George Bryan[4]	Acting President of the Council	1777
Joseph Reed	President of the Council	1778–1781
William Moore	„	1781–1782
John Dickinson	„	1782–1785
Benjamin Franklin	„	1785–1788
Thomas Mifflin	„	1788–1790
Thomas Mifflin	Federalist	1790–1799
Thomas McKean	Democratic-Republican	1799–1808
Simon Snyder	„	1808–1817
William Finley	„	1817–1820
Joseph Heister	„	1820–1823
John A. Shulze	„	1823–1829
George Wolf	Democrat	1829–1835
Joseph Ritner	Anti-Masonic	1835–1839
D. R. Porter	Democrat	1839–1845
F. R. Shunk	„	1845–1848
W. F. Johnston[5]	Whig	1848–1852
William Bigler	Democrat	1852–1855
James Pollock	„	1855–1858
W. F. Packer	„	1858–1861
A. G. Curtin	Republican	1861–1867
John W. Geary	„	1867–1873
John F. Hartranft	„	1873–1879
Henry M. Hoyt	„	1879–1883
Robert E. Pattison	Democrat	1883–1887
James A. Beaver	Republican	1887–1891
Robert E. Pattison	Democrat	1891–1895
Daniel H. Hastings	Republican	1895–1899
William A. Stone	„	1899–1903
Samuel W. Pennypacker	„	1903–1907
Edwin S. Stuart	„	1907–

(Philadelphia, 1801 sqq. and Harrisburg, 1802 sqq.); and *The Statutes at Large of Pennsylvania* (Philadelphia, 1896 sqq.), published under an act of 1887. Some valuable information is to be found in B. A. and M. L. Hinsdale, *History and Civil Government of Pennsylvania* . . . (Chicago, 1899); and in the various editions of Smull's *Legislative Handbook and Manual*. For the history of penal and charitable institutions, see the *Annual Reports of the Board of Commissioners of Public Charities* (Harrisburg, 1871 sqq.); the *Annual Reports of the Committee on Lunacy* (Harrisburg, 1883 sqq.); and Amos H. Mylin, *Penal and Charitable Institutions of Pennsylvania* (2 vols., Harrisburg, 1897), an official publication, well written and handsomely illustrated. For educational history, see N. C. Schaeffer, *The Common School Laws of Pennsylvania* (Harrisburg, 1904); B. A. Hinsdale, *Documents Illustrative of American Educational History* (Washington, 1895); and J. P. Wickersham, *History of Education in Pennsylvania* (Lancaster, 1886), one of the best state histories of education. For finance and banking, see the annual reports of the state treasurer, auditor-general, sinking fund commissioners, and the commissioner of banking, all published at Harrisburg; *An Historical Sketch of the Paper Money of Pennsylvania*, by a member of the Numismatic Society of Philadelphia (Philadelphia, 1862); and B. M. Mead, *A Brief Review of the Financial History of Pennsylvania . . . to the Present Time (1682–1881)* (Harrisburg, 1881).

The only complete history of the entire period is Howard M. Jenkins, *et al.*, *Pennsylvania, Colonial and Federal* (3 vols., Philadelphia, 1903). This is especially valuable for the detailed histories of gubernatorial administrations from 1790 to 1903. The third volume contains useful chapters on education, the judiciary, the medical profession, journalism, military affairs, internal improvements, &c. S. G. Fisher, *Pennsylvania, Colony and Commonwealth* (Philadelphia, 1897) contains the best short account of the colonial and revolutionary history, but it gives only a very brief summary of the period since 1783. W. R. Shepherd, *History of Proprietary Government in Pennsylvania* (New York, 1896), a detailed study of the proprietary from the political, governmental and territorial points of view, is scholarly, and gives a good account of the boundary disputes with Maryland, Virginia, New York and Connecticut. Among the older standard works are Samuel Hazard, *Annals of Pennsylvania from the Discovery of the Delaware, 1609–1682* (Philadelphia, 1850), an elaborate account of the early Dutch and Swedish settlements on the Delaware River and Bay; and Robert Proud, *History of the Pennsylvania from* 1681 *until after the year 1742* (2 vols., Philadelphia, 1797–1798), written from the Quaker standpoint. For early literary history, see M. K. Jackson, *Outline of the Literary History of Colonial Pennsylvania* (New York, 1908). W. H. Egle, *Illustrated History of the Commonwealth of Pennsylvania* (Harrisburg, 1877), contains trustworthy histories of individual counties by various writers. J. B. McMaster and F. D. Stone, *Pennsylvania and the Federal Constitution, 1787–1788* (Philadelphia, 1888), is a useful work. For the anti-Masonic movement, see Charles McCarthy, *The Anti-Masonic Party* (Washington, 1903). S. G. Fisher, *The Making of Pennsylvania* (Philadelphia, 1896), introductory to the same author's *Colony and Commonwealth*, is an interesting study of the various nationalities and religions represented among the settlers of the state. For the period of Quaker predominance (1681–1756), see Isaac Sharpless, *History of Quaker Government in Pennsylvania* (2 vols., Philadelphia, 1898–1899). See also J. Taylor Hamilton's "History of the Moravian Church" (Nazareth, Pa., 1900), vol. vi. of the *Transactions of the Moravian Historical Society; Proceedings and Addresses of the Pennsylvania German Society*, vols. vii. and viii. (Reading, 1897–1898); J. F. Sachse, *German Pietists of Provincial Pennsylvania, 1694–1708* (Philadelphia, 1895), and *German Sectarians of Pennsylvania, 1708–1800* (2 vols., Philadelphia, 1899–1901). The chief sources are the *Pennsylvania Archives* (first series, 12 vols., Philadelphia, 1852–1856; second series, 19 vols., Harrisburg, 1874–1893; and third series, 4 vols., Harrisburg, 1894–1895); *Colonial Records, 1683–1790* (16 vols., Philadelphia, 1852); and Samuel Hazard, *Register of Pennsylvania* (16 vols., Philadelphia, 1828–1836). The Pennsylvania Historical Society, organized in Philadelphia in 1825, has published 14 vols. of *Memoirs* (1826–1895), a *Bulletin* of 13 numbers (1845–1847), one volume of *Collections* (1853), and the *Pennsylvania Magazine of History and Biography*, a quarterly (1877 sqq.). There is a good account of the public archives, both printed and manuscript, in the first report of the Public Archives Commission of the American Historical Association, published in vol. ii. of the annual report of the association for the year 1900 (Washington, 1901).

PENNSYLVANIA, UNIVERSITY OF, an American institution of higher learning, in Philadelphia, occupying about 60 acres, near the west bank of the Schuylkill River, north-east of the Philadelphia Hospital, east of 39th Street, south-east of Woodland Avenue, and south of Chestnut Street. In this irregular area are all the buildings except the Flower Astronomical Observatory (1896), which is 2 m. beyond the city limits on the West Chester Pike. The northernmost of these buildings is the law school, between Chestnut and Sansom Streets, on 34th Street. In a great triangular block bounded by Woodland Avenue, Spruce Street, and 34th Street are: the university library, which had in 1909 about 275,000 bound volumes and 50,000 pamphlets, including the Biddle Memorial law library (1886) of 40,000 volumes, the Colwell and Henry C. Carey collections in finance and economics, the Francis C. Macauley library of Italian, Spanish and Portuguese authors, with an excellent Dante collection, the classical library of Ernst von Leutsch of Göttingen, the philological library of F. A. Pott of Halle, the Germanic library of R. Bechstein of Rostock, the Semitic library of C. P. Caspari of Copenhagen, the (Hebrew and Rabbinical) Marcus Jastrow Memorial library, the ethnological library of D. G. Brinton, and several special medical collections; College Hall, with the university offices; Howard Houston Hall (1896) the students' club; Logan Hall; the Robert Hare chemical laboratory; and (across 36th Street) the Wistar institute of anatomy and biology. Immediately east of this triangular block are: Bennett House; the Randal Morgan laboratory of physics; the engineering building (1906); the laboratory of hygiene (1892); dental hall; and the John Harrison laboratory of chemistry. Farther east are the gymnasium, training quarters and Franklin (athletic) field, with brick grand-stands. South of Spruce Street are: the free museum of science and art (1899), the north-western part of a projected group, with particularly valuable American, Egyptian, Semitic and Cretan collections, the last two being the results in part of university excavations at Nippur (1888–1902) and at Gournia (1901–1904); between 34th and 36th Streets the large and well-equipped university hospital (1874); large dormitories, consisting in 1909, of 29 distinct but connected houses; medical laboratories; a biological hall and vivarium; and across Woodland Avenue, a veterinary hall and hospital.

The university contains various departments, including the college (giving degrees in arts, science, biology, music, architecture, &c.), the graduate school (1882), a department of law (founded in 1790 and re-established in 1850) and a department of medicine (first professor, 1756; first degrees granted, 1768), the oldest and probably the most famous medical school in America. Graduation from the school of arts in the college is dependent on the successful completion of 60 units of work (the unit is one hour's work a week for a year in lectures or recitations or two hours' work a week for a year in laboratory courses); this may be done in three, four or five years; of the 60 counts: 22 must be required in studies (chemistry, 2 units; English, 6; foreign languages, 6; history, logic and ethics, mathematics, and physics, 2 each); 18 must be equally distributed in two or three "groups"—the 19 groups include astronomy, botany, chemistry, economics, English, fine arts, French, geology, German, Greek, history, Latin, mathematics, philosophy, physics, political science, psychology, sociology and zoology; and in the remaining 20 units the student's election is practically free. Special work in the senior year of the college counts 8 units for the first year's work in the department of medicine. College scholarships are largely local, two being in the gift of the governor of the state, fifty being for graduates of the public schools of the city of Philadelphia, and five being for graduates of Pennsylvania public schools outside Philadelphia; in 1909 there were twenty-eight scholarships in the college not local. In the graduate school there are five fellowships for research, each with an annual stipend of $800, twenty-one fellowships valued at $500 each, for men only, and five fellowships for women, besides special fellowships and 39 scholarships.

The corporation of the university is composed of a board of twenty-four trustees, of which the governor of Pennsylvania is *ex-officio* president. The directing head of the university, and the head of the university faculty and of the faculty of each department is the provost—a title rarely used in American universities; the provost is president *pro tempore* of the board of trustees.

In 1908–1909 the university had 454 officers of instruction, of whom 220 were in the college and 157 in the department

of medicine, and an enrolment of 4570 students, of whom 2989 were in the college (412 in the school of arts; 987 in the Towne scientific school; 472 in the Wharton school, and 253 in the evening school of accounts and finance; 384 in courses for teachers; and 481 in the summer school), 353 in the graduate school, 327 in the department of law, 559 in the department of medicine, 385 in the department of dentistry, and 150 in the department of veterinary medicine.

In August 1907 the excess of the university's assets over its liabilities was $13,239,408 and the donations for the year were $305,814. A very large proportion of the university's investments is in real estate, especially in Philadelphia. In 1907 the total value of real estate (including the university buildings) was $6,829,154; and libraries, museums, apparatus and furniture were valued at $2,025,357. Students' tuition fees vary from $150 to $200 a year in the college; and are $160 in the department of law, $200 in the department of medicine, $150 in the department of dentistry and $100 in the department of veterinary science. The income from tuition fees in 1906-1907 was $458,396; the payments for "educational salaries" amounted to $433,311, and for "administration salaries" to $135,314.

The university publishes the following series: *Astronomical Series* (1899 sqq.); *Contributions from the Botanical Laboratory* (1892 sqq.); *Contributions from the Laboratory of Hygiene* (1898 sqq.); *Contributions from the Zoological Laboratory* (1893 sqq.); *Series in History* (1901 sqq.); *Series in Mathematics* (1897 sqq.); *Series in Philology and Literature* (1891 sqq.); *Series in Romanic Languages and Literatures* (1907 sqq.); *Series in Philosophy* (1890 sqq.); *Series in Political Economy and Public Law* (1885 sqq.); *The American Law Register* (1852 sqq.); *The University of Pennsylvania Medical Bulletin* (1888 sqq.); *Transactions of the Department of Archaeology* (1904 sqq.); the *Journal of Morphology* (1887 sqq.); and *Transactions and Proceedings of the Botanical Society of Pennsylvania* (1897 sqq.). There are also occasional publications by institutes and departments connected with the university. Student publications include: a daily, *The Pennsylvanian* (1885); the weekly, *Old Penn* (1902); a comic monthly, *The Punch Bowl*; a literary monthly, *The Red and Blue*; a quarterly of the department of dentistry, *The Penn Dental Journal*; an annual, *The Record*; and *The Alumni Register* (1896), a monthly.

Benjamin Franklin in 1749 published a pamphlet, entitled *Proposals Relating to the Education of Youth in Pensilvania*, which led to the formation of a board of twenty-four trustees, nineteen of whom, on the 13th of November 1749, met for organization and to promote "the Publick Academy in the City of Philadelphia," and elected Benjamin Franklin president of the board, an office which he held until 1756. So closely was Franklin identified with the plan that Matthew Arnold called the institution "the University of Franklin." On the 1st of February 1750 there was conveyed to this board of trustees the "New Building" on Fourth Street, near Arch, which had been erected in 1740 for a charity school—a use to which it had not been put—and as a "house of Publick Worship," in which George Whitefield had preached in November 1740; the original trustees (including Franklin) of the "New Building" and of its projected charity school date from 1740, and therefore the university attaches to its seal the words "founded 1740." In the "New Building" the academy was opened on the 7th of January 1751, the city having voted £200 in the preceding August for the completion of the building. On the 16th of September 1751 a charitable school "for the instruction of poor Children *gratis* in *Reading, Writing*, and *Arithmetick*" was opened in the "New Building." The proprietaries, Thomas and Richard Penn, incorporated "The Trustees of the Academy and Charitable School in the Province of Pennsylvania" in 1753; and in 1755 issued a confirmatory charter, changing the corporate name to "The Trustees of the College, Academy and Charitable School," &c., whereupon William Smith (1727-1803) of the university of Aberdeen, who had become rector of the academy in 1752 and had taken orders in the Church of England in 1753, became provost of the college. In 1756 Dr Smith established a complete and liberal curriculum which was adopted by Bishop James Madison in 1777 when he became president of the College of William and Mary. In 1757 the first college class graduated. Under Smith's control the Latin school grew in importance at the expense of the English school, to the great annoyance of Franklin. In 1762-1764 Dr Smith collected for the college in England about £6900; and in 1764 his influence had become so strong that it was feared that the college would become sectarian. The Penns and others deprecated this and the trustees bound themselves (1764) to "use their utmost endeavours that . . . (the original plan) be not narrowed, nor the members of the Church of England, nor those dissenting from them . . . be put on any worse footing in this seminary than they were at the time of receiving the royal brief." From September 1777 to June 1778 college exercises were not held, because Philadelphia was occupied by British troops. In 1779 the state legislature, on the ground that the trustees' declaration in 1764 was a "narrowing of the foundation," [1] confiscated the rights and property of the college and chartered a new corporation "the Trustees of the University of the State of Pennsylvania"; in 1789 the college was restored to its rights and property and Smith again became its provost; in 1791 the college and the university of the State of Pennsylvania were united under the title, "the University of Pennsylvania," whose trustees were elected from their own members by the board of trustees of the college and that of the university. In 1802 the university purchased new grounds on Ninth Street, between Market and Chestnut, where the post office building now is; there until 1829 the university occupied the building erected for the administrative mansion of the president of the United States; there new buildings were erected after 1829; and from these the university removed to its present site in 1872.

The provosts have been: in 1755-1779 and in 1789-1803, William Smith; in 1779-1791, of the university of the state of Pennsylvania, John Ewing (1732-1802); in 1807-1810, John McDowell (1750-1820); in 1810-1813, John Andrews (1746-1813); in 1813-1828, Frederick Beasley (1777-1845); in 1828-1833, William Heathcote De Lancey (1797-1865); in 1834-1853, John Ludlow (1793-1857); in 1854-1859, Henry Vethake (1792-1866); in 1860-1868, Daniel Raynes Goodwin (1811-1890); in 1868-1880, Charles Janeway Stillé (1819-1899); in 1881-1894, William Pepper (1843-1898), and in 1894 sqq., Charles Custis Harrison (b. 1844).

See T. H. Montgomery, *A History of the University of Pennsylvania from its Foundation to A.D. 1770* (Philadelphia, 1900); George B. Wood, *Early History of the University of Pennsylvania* (3rd ed., ibid., 1896); J. B. McMaster, *The University of Pennsylvania* (ibid. 1897); G. E. Nitzsche, *Official Guide to the University of Pennsylvania* (ibid., 1906); and Edward P. Cheyney, "University of Pennsylvania," in vol. i. of *Universities and their Sons* (Boston, 1901).

PENNY (Mid. Eng. *peni* or *peny*, from O. Eng. form *penig*, earlier *penning* and *pending*; the word appears in Ger. *Pfennig* and Du. *penning*; it has been connected with Du. *pand*, Ger. *Pfand*, and Eng. "pawn," the word meaning a little pledge or token, or with Ger. *Pfanne*, a pan), an English coin, equal in value to the one-twelfth of a shilling. It is one of the oldest of English coins, superseding the sceatta or sceat (see NUMISMATICS; and BRITAIN: *Anglo-Saxon*, § "Coins"). It was introduced into England by Offa, king of Mercia, who took as a model a coin first struck by Pippin, father of Charlemagne, about 735, which was known in Europe as *novus denarius*. Offa's penny was made of silver and weighed 22½ grains, 240 pennies weighing one Saxon pound (or Tower pound, as it was afterwards called), hence the term pennyweight (dwt.). In 1527 the Tower pound of 5400 grains was abolished, and the pound of 5760 grains adopted instead. The penny remained, with some few exceptions, the only coin issued in England until the introduction of the gold florin by Edward III. in 1343. It was not until the reign of Edward I. that halfpence and farthings became a regular part of the coinage, it having been usual to subdivide the penny for trade purposes by cutting it into halves and quarters, a practice said to have originated in the reign of Æthelred II. In 1257, in the reign of Henry III., a gold penny,

[1] Probably the actual reason was that the assembly, dominated by the advocates of the radical constitution of 1776, was attempting to punish the trustees of the college, who were almost all "anti-constitutionalists."

of the value of twenty silver pence, was struck. The weight and value of the silver penny steadily declined from 1300 onwards, as will be seen from the following table:—

Reign.	Weight.	Value in silver 925 fine, at 5s. 6d. per oz.
	Grains.	Penny.
William I., 1066	22½	3·09
Edward I., 1300	22	3·02
" III., 1344	20¼	2·78
" III., 1346	20	2·75
" III., 1351	18	2·47
Henry IV., 1412	15	2·06
Edward IV., 1464	12	1·65
Henry VIII., 1527	10½	1·44
" VIII., 1543	10	1·37
Edward VI., 1552	8	1·10
Elizabeth, 1601	7½	1·06

The last coinage of silver pence for general circulation was in the reign of Charles II. (1661–1662), since which time they have only been coined for issue as royal alms on Maundy Thursdays. Copper halfpence were first issued in Charles II.'s reign,[1] but it was not until 1797, in the reign of George III., that copper pence were struck. This copper penny weighed 1 oz. avoirdupois. In the same year copper twopences were issued weighing 2 oz., but they were found too cumbersome and were discontinued. In 1860 bronze was substituted for the copper coinage, the alloy containing 95 parts of copper, 4 of tin, and 1 of zinc. The weight was also reduced, 1 lb of bronze being coined into 48 pennies, as against 24 pennies into which 1 lb of copper was coined.

PENN YAN, a village and the county-seat of Yates county, New York, U.S.A., situated N. of Keuka Lake, on the outlet extending to Lake Seneca, about 170 m. W. of Albany, and about 95 m. E. by S. of Buffalo. Pop. (1905, state census), 4504. It is served by the New York Central & Hudson River and the Northern Central railways and by electric railway to Branchport, and has steamboat connexions with Hammondsport at the head of Keuka Lake. The lake, one of the most beautiful of the so-called "finger lakes" of central New York, abounds in lake and rainbow trout, black bass, pickerel and pike, and there are many summer cottages along its shores. At Keuka Park, on the west shore of the lake, is Keuka College (1890), and at Eggleston's Point is held a summer "natural science camp" for boys. The village is the seat of the Penn Yan Academy (1859). The lake furnishes water-power, and among the manufactures are paper, lumber, carriages, shoes, &c. Much ice is shipped from the village. Penn Yan is an important shipping point in the apple and grape-growing region of central New York, and winemaking is an important industry. The first frame dwelling at Penn Yan was built in 1799; the village became the county-seat in 1823, when Yates county was created, and was incorporated in 1833. The first settlers were chiefly followers of Jemima Wilkinson (1753–1819), a religious enthusiast, born in Cumberland township, Providence county, Rhode Island, who asserted that she had received a divine commission. She preached in Rhode Island, Connecticut, Massachusetts and Pennsylvania. Obtaining a large tract (which was called Jerusalem in 1789) in the present Yates county, she founded in 1788 the village of Hopeton on the outlet of Keuka Lake about a mile from Seneca Lake. Many followers settled there, and she herself lived there after 1790. Some of her followers left her before 1806, and then the community gradually broke up. The name of the village is said to have been derived from the first syllables of "Pennsylvania" and "Yankee," as most of the early settlers were Pennsylvanians and New Englanders.

See Lewis C. Aldrich, *History of Yates County, New York* (Syracuse, 1892).

PENNYROYAL, in botany, a herb formerly much used in medicine, the name being a corruption of the old herbalist's name "Pulioll-royall," *Pulegium regium*. It is a member of the mint genus, and has been known to botanists since the time of Linnaeus as *Mentha pulegium*. It is a perennial herb with a slender branched stem, square in section, up to a foot in length and rooting at the lower nodes, small opposite stalked oval leaves about half-inch long, and dense clusters of small reddish-purple flowers in the leaf axils, forming almost globular whorls. It grows in damp gravelly places, especially near pools, on heaths and commons. It has a strong smell somewhat like that of spearmint, due to a volatile oil which is readily obtained by distillation with water, and is known in pharmacy as *Oleum pulegii*. The specific name recalls its supposed property of driving away fleas (*pulices*). Like the other mints it has carminative and stimulant properties.

PENOBSCOT, a tribe of North American Indians of Algonquian stock. Their old range was the country around the river Penobscot in Maine. They sided with the French in the colonial wars, but made a treaty of peace with the English in 1749. They fought against the English in the War of Independence, and were subsequently settled on an island in the Penobscot River, near Oldtown.

PENOLOGY (Lat. *poena*, punishment), the modern name given to penitentiary science, that concerned with the processes devised and adopted for the repression and prevention of crime. (See CRIME; CRIMINOLOGY; PRISON; JUVENILE OFFENDERS; RECIDIVISM, &c.)

PENRHYN, GEORGE SHOLTO GORDON DOUGLAS-PENNANT, 2nd BARON (1836–1907), was the son of Colonel Edward Gordon Douglas (1800–1886), brother of the 19th earl of Morton, who, through his wife, Juliana, elder daughter and coheir of George Hay Dawkins-Pennant, of Penrhyn Castle, Carnarvon, had large estates in Wales and elsewhere, and was created Baron Penrhyn in 1866. Dawkins had inherited the estates from Richard Penryn, who was created Baron Penryn in 1763, the title becoming extinct on his death in 1808.

George Douglas-Pennant was Conservative M.P. for Carnarvonshire in 1866–1868 and 1874–1880, and succeeded his father in the title in 1886. A keen sportsman, a benevolent landlord, a kind and considerate employer, Lord Penrhyn came of a proud race, and was himself of an imperious disposition. He came prominently before the public in 1897 and subsequent years in connexion with the famous strike at his Welsh slate quarries. During his father's lifetime the management of the Penrhyn quarry had been left practically to an elective committee of the operatives, and it was on the verge of bankruptcy when in 1885 he took matters in hand; he abolished the committee, and with the help of Mr E. A. Young, whom he brought in from London as manager, he so reorganized the business that this slate-quarry yielded a profit of something like £150,000 a year. The new men and new methods were, however, not to the taste of the trade unionist leaders of the quarrymen, and in 1897, when the "new unionism" was rampant in labour questions throughout England, a strike was deliberately fomented. Lord Penrhyn refused to recognize the union or its officials, though he was willing to consider any grievances from individual quarrymen, and a protracted struggle ensued, in which his determination was invincible. He became the object of the bitterest political hostility, and trade unionism exerted itself to the utmost, but vainly, to bring about some form of government intervention. Penrhyn strikers perambulated the country, singing and collecting contributions to their funds. But in spite of every pressure Lord Penrhyn insisted on being master of his own property, and by degrees the agitation collapsed. His death on the 10th of March 1907 evoked general and genuine regret. Lord Penrhyn was twice married, and had fifteen surviving children. He was succeeded in the title by his eldest son, Edward Sholto (b. 1864), who was Unionist M.P. for South Northamptonshire from 1895 to 1900.

[1] The figure of Britannia first appeared on this issue of copper coins. The original of Britannia is said to have been Frances Stewart, afterwards duchess of Richmond (Pepys, *Diary*, Feb. 25, 1667). In was in Charles II.'s reign, too, that the practice was established of placing the sovereign's bust in a direction contrary to that of his predecessor.

PENRITH, a municipality of Cumberland county, New South Wales, Australia, on the Nepean River, 34 m. by rail W. by N. of Sydney. Penrith and the adjoining township of St Mary's are chiefly remarkable for their connexion with the railway. The iron tubular bridge which carries the line over the Nepean is the best of its kind in the colony, while the viaduct over Knapsack Gulley is the most remarkable erection of its kind in Australia. There are large engineering works and railway fitting shops at Penrith, which is also the junction for all the western goods traffic. The inhabitants of both towns are mainly railway employés. Pop. (1901), of Penrith 3539, of St Mary's 1840.

PENRITH, a market town in the Penrith parliamentary division of Cumberland, England, in a valley near the river Eamont, on the Cockermouth, Keswick & Penrith, London & North Western and North Eastern railways. Pop. of urban district (1901), 9182. It contains some interesting brasses. A 14th-century grammar school was refounded by Queen Elizabeth; and there are two mansions dating from the same reign, which have been converted into inns. Though there are breweries, tanneries and saw-mills, the town depends mainly on agriculture. There are some ruins of a castle erected as a protection against the Scots. Near Penrith on the south, above the precipitous bank of the Eamont, stands a small but beautiful old castellated house, Yanwath Hall. To the north-east of the town is Eden Hall, rebuilt in 1824. Among many fine paintings, it contains portraits by Hoppner, Kneller, Lely, Opie and Reynolds. The "Luck of Eden Hall," which has been celebrated in a ballad by the duke of Wharton, and in a second ballad written by Uhland, the German poet, and translated by Longfellow, is an enamelled goblet, kept in a leathern case dating from the times of Henry IV. or Henry V. It was long supposed to be Venetian, but has been identified as of rare Oriental workmanship. The legend tells how a seneschal of Eden Hall one day came upon a company of fairies dancing at St Cuthbert's Well in the park. These flew away, leaving their cup at the water's edge, and singing "If that glass either break or fall, Farewell to the luck of Eden Hall." Its true history is unknown.

Penrith, otherwise Penreth, Perith, Perath, was founded by the Cambro-Celts, but on a site farther north than the present town. In 1222 Henry III. granted a yearly fair extending from the eve of Whitsun to the Monday after Trinity and a weekly market on Wednesday, but some time before 1787 the market day was changed to Tuesday. The manor in 1242 was handed over to the Scottish king who held it till 1295, when Edward I. seized it. In 1397 Richard II. granted it to Ralph Neville, first earl of Westmorland; it then passed to Warwick the king-maker and on his death to the Crown. In 1694 William III. granted the honour of Penrith to the earl of Portland, by whose descendant it was sold in 1787 to the duke of Devonshire. A court leet and view of frankpledge have been held here from time immemorial. In the 18th and early part of the 19th century Penrith manufactured checks, linen cloth and ginghams, but the introduction of machinery put an end to this industry, only the making of rag carpets surviving. Clock and watch making seems to have been an important trade here in the 18th century. The town suffered much from the incursions of the Scots; and Ralph, earl of Westmorland, who died 1426, built the castle, but a tower called the Bishop's Tower had been previously erected on the same site. In 1597–1598 a terrible visitation of plague attacked the town, in which, according to an old inscription on the church, 2260 persons perished in Penrith, by which perhaps is meant the rural deanery. During the Civil War the castle was dismantled by the Royalist commandant. In 1745 Prince Charles Edward twice marched through Penrith, and a skirmish took place at Clifton. The church of St Andrew is of unknown foundation, but the list of vicars is complete from 1223.

PENRY, JOHN (1559–1593), Welsh Puritan, was born in Brecknockshire in 1559; tradition points to Cefn Brith, a farm near Llangammarch, as his birthplace. He matriculated at Peterhouse, Cambridge, in December 1580, being then almost certainly a Roman Catholic; but soon became a convinced Protestant, with strong Puritan leanings. Having graduated B.A., he migrated to St Alban's Hall, Oxford, and proceeded M.A. in July 1586. He did not seek episcopal ordination, but was licensed as University Preacher. The tradition of his preaching tours in Wales is slenderly supported; they could only have been made during a few months of 1586 or the autumn of 1587. At this time ignorance and immorality abounded in Wales. In 1562 an act of parliament had made provision for translating the Bible into Welsh, and the New Testament was issued in 1567; but the number printed would barely supply a copy for each parish church. Indignant at this negligence, Penry published, early in 1587, *The Æquity of an Humble Supplication—in the behalf of the country of Wales, that some order may be taken for the preaching of the Gospel among those people.* Archbishop Whitgift, angry at the implied rebuke, caused him to be brought before the High Commission and imprisoned for about a month. On his release Penry married a lady of Northampton, which town was his home for some years. With the assistance of Sir Richard Knightley and others, he set up a printing press, which for nearly a year from Michaelmas 1588 was in active operation. It was successively located at East Moulsey (Surrey), Fawsley (Northampton), Coventry and other places in Warwickshire, and finally at Manchester, where it was seized in August 1589. On it were printed Penry's *Exhortation to the governours and people of Wales*, and *View of . . . such publike wants and disorders as are in the service of God . . . in Wales*; as well as the celebrated *Martin Marprelate* tracts. In January 1590 his house at Northampton was searched and his papers seized, but he succeeded in escaping to Scotland. There he published several tracts, as well as a translation of a learned theological work known as *Theses Genevenses*. Returning to England in September 1592, he joined the Separatist Church in London, in which he declined to take office, though after the arrest of the ministers, Francis Johnson and John Greenwood, he seems to have been the regular preacher. He was arrested in March 1593; and efforts were made to find some pretext for a capital charge. Failing this a charge of sedition was based on the rough draft of a petition to the queen that had been found among his private papers; the language of which was indeed harsh and offensive, but had been neither presented nor published. He was convicted by the Queen's Bench on the 21st of May 1593, and hanged on the 29th at the unusual hour of 4 p.m., the signature of his old enemy Whitgift being the first of those affixed to the warrant.

See the *Life*, by John Waddington (1854).

PENRYN, a market town and port, and municipal and contributary parliamentary borough of Cornwall, England, 2 m. N.W. of Falmouth, on a branch of the Great Western railway. Pop. (1901), 3190. It lies at the head of the estuary of the Penryn River, which opens from the main estuary of the Fal at Falmouth. Granite, which is extensively quarried in the neighbourhood, is dressed and polished at Penryn, and there are also chemical and bone manure works, engineering, iron and gunpowder works, timber-yards, brewing, tanning and paper-making. The harbour dries at low tide, but at high tide has from 9 to 12½ ft. of water. Area, 291 acres.

Penryn owed its development to the fostering care of the bishops of Exeter within whose demesne lands it stood. These lands appear in Domesday Book under the name of Trelivel. In 1230 Bishop Briwere granted to his burgesses of Penryn that they should hold their burgages freely at a yearly rent of 12d. by the acre for all service. Bishop Walter de Stapeldon secured a market on Thursdays and a fair at the Feast of St Thomas. The return to the bishop in 1307 was £7, 13s. 2½d. from the borough and £26, 7s. 5d. from the forum. In 1311 Bishop Stapeldon procured a three days' fair at the Feast of St Vitalis. Philip and Mary gave the parliamentary franchise to the burgesses in 1553. James I. granted and renewed the charter of incorporation, providing a mayor, eleven

aldermen and twelve councillors, markets on Wednesdays and Saturdays, and fairs on the 1st of May, the 7th of July and the 21st of December. The charter having been surrendered, James II. by a new charter *inter alia* confined the parliamentary franchise to members of the corporation. This proviso however was soon disregarded, the franchise being freely exercised by all the inhabitants paying scot and lot. An attempt to deprive the borough of its members, owing to corrupt practices, was defeated by the House of Lords in 1827. The act of 1832 extended the franchise to Falmouth in spite of the rivalry existing between the two boroughs, which one of the sitting members asserted was so great that no Penryn man was ever known to marry a Falmouth woman. In 1885 the united borough was deprived of one of its members. The corporation of Penryn was remodelled in 1835, the aldermen being reduced to four. Its foreign trade, which dates from the 14th century, is considerable. The extra-parochial collegiate church of Glasney, founded by Bishop Bronescombe in 1265, had a revenue at the time of its suppression under the act of 1545 of £221, 18s. 4d.

See *Victoria County History: Cornwall*; T. C. Peter, *Glasney Collegiate Church*.

PENSACOLA, a city, port of entry, and the county-seat of Escambia county, Florida, U.S.A., in the N.W. part of the state, on Pensacola Bay, about 6 m. (11 m. by channel) N. of the Gulf of Mexico. Pop. (1890), 11,750; (1900), 17,747. It ranks second in size among the cities of Florida. The city is served by the Louisville & Nashville and the Pensacola, Alabama & Tennessee railways, and by steamers to West Indian, European and United States ports. The harbour[1] is the most important deep-water harbour south of Hampton Roads. The narrow entrance is easily navigable and is defended by Fort Pickens on the west end of Santa Rosa Island, with a great sea-wall on the Gulf side (completed in 1909), Fort McRee on a small peninsula directly opposite, and Fort Barrancas on the mainland immediately north-east of Fort McRee. On the mainland 1 m. east of Fort Barrancas are a United States Naval Station, consisting of a yard (84 acres enclosed) with shops, a steel floating dry dock and marine barracks; and a reservation (1800 acres) on which are a naval hospital, a naval magazine, two timber ponds, a national cemetery, and the two villages of Warrington and Woolsey, with a population of about 1500, mostly employés of the yard. The city's principal public buildings are the state armoury, the Federal building, and the city hall. The mean annual temperature is about 72° F., and breezes from the Gulf temper the heat. Pensacola is a shipping point for lumber, naval stores, tobacco, phosphate rock, fish, cotton and cotton-seed oil, meal and cake, and is one of the principal markets in the United States for naval stores. In 1895 the foreign exports were valued at $3,196,609, in 1897 at $8,436,679, and in 1909 at $20,971,670; the imports in 1909 were valued at $1,479,017 The important factor in this vast development has been the Louisville & Nashville railway, which after 1895 built extensive warehouses and docks at Pensacola. There are excellent coaling docks—good coal is brought hither from Alabama—and a grain elevator. Among the manufactures are sashes, doors and blinds, whiting, fertilizers, rosin and turpentine, and drugs.

Pensacola Bay may have been visited by Ponce de Leon in 1513 and by Panfilo de Narvaez in 1528. In 1540 Maldonado, the commander of the fleet that brought De Soto to the Florida coast, entered the harbour, which he named Puerta d'Auchusi, and on his recommendation De Soto designated it as a basis of supplies for his expedition into the interior. In 1559 a permanent settlement was attempted by Tristan de Luna, who renamed the harbour Santa Maria, but two years later this settlement was abandoned. In 1696 another settlement was made by Don Andres d'Arriola, who built Fort San Carlos near the site of the present Fort Barrancas, and seems to have named the place Pensacola. In 1719, Spain and France being at war, Pensacola was captured by Sieur de Bienville, the French governor of Louisiana. Later in the same year it was successively re-taken by a Spanish force from Havana and recaptured by Bienville, who burned the town and destroyed the fort. In 1723, three years after the close of hostilities, Bienville relinquished possession. The Spanish then transferred their settlement to the west end of Santa Rosa Island, but after a destructive hurricane in 1754 they returned to the mainland. In 1763, when the Floridas were ceded to Great Britain, Pensacola became the seat of administration for West Florida and most of the Spanish inhabitants removed to Mexico and Cuba. During the War of American Independence the town was a place of refuge for many Loyalists from the northern colonies. On the 9th of May 1781 it was captured by Don Bernardo de Galvez, the Spanish governor at New Orleans. Most of the English inhabitants left, but trade remained in the hands of English merchants. During the war of 1812 the British made Pensacola the centre of expeditions against the Americans, and in 1814 a British fleet entered the harbour to take formal possession. In retaliation General Andrew Jackson attacked the town, driving back the British. In 1818, on the ground that the Spanish encouraged the Seminole Indians in their attacks upon the American settlements in Florida, Jackson again captured Pensacola, and in 1821 Florida was finally transferred to the United States. On the 12th of January 1861 the Navy Yard was seized by order of the state government, but Fort Pickens, defended first by an insignificant force under Lieut. Adam J. Slemmer (1828–68) and afterwards by a larger force under Lieut.-Colonel Harvey Brown (1796–74), remained in the hands of the Union forces, and on the 8th of May 1862 the Confederates abandoned Pensacola. Pensacola was chartered as a city in 1895.

[1] In 1881 the United States government began to improve the harbour by dredging, and in June 1909 the depth of the channel, for a minimum width of about 300 ft., was 30 ft. at mean low water.

PENSHURST, a village in the south-western parliamentary division of Kent, England, at the confluence of the Eden and Medway, 4½ m. S.W. of Tonbridge. Pop. (1901), 1678. The village is remarkable for some old houses, including a timbered house of the 15th century, and for a noted factory of cricket implements. The church, chiefly late Perpendicular, contains a large number of monuments of the Sidney family and an effigy of Sir Stephen de Penchester, Warden of the Cinque Ports in the time of Edward I. Penshurst Place is celebrated as the home of the Sidney family. Anciently the residence of Sir Stephen de Penchester, Penshurst was granted to Henry VIII.'s chamberlain, Sir William Sidney, whose grandson, Sir Philip Sidney, was born here in 1554. It passed to Sir Philip's younger brother Robert, who in 1618 was created earl of Leicester. On the death of the seventh earl in 1743 the estates devolved upon his niece Elizabeth, whose only child married Sir Bysshe Shelley of Castle Goring. Their son was created a baronet in 1818 as Sir John Shelley-Sidney, and his son was created Baron de L'Isle and Dudley in 1835. The mansion is quadrangular, and has a fine court, chapel and hall (*c.* 1341) with open timber roof and a minstrels' gallery. The various rooms contain an interesting collection of portraits, armour and other family relics. The praises of the park and the house have been sung in Sir Philip Sidney's *Arcadia*, and by Ben Jonson, Edmund Waller and Robert Southey.

PENSION (Lat. *pensio*, a payment, from *pendere*, to weigh, to pay), a regular or periodical payment made by private employers, corporations or governments, in consideration either of past services or of the abolition of a post or office. Such a pension takes effect on retirement or when the period of service is over. The word is also used in the sense of the payment by members of a society in respect of dues.

United Kingdom.

In the United Kingdom the majority of persons in the employ of the government are entitled to pensions on reaching a certain age and after having served the state for a certain minimum number of years. That such is the case, and moreover that it is usual to define such pensions as being given in consideration of past services, has led to the putting forward very generally the argument that pensions, whether given by a government or

by private employers, are in the nature of deferred pay, and that holders of posts which carry pensions must therefore be rewarded by a remuneration less than the full market rate, by the difference of the value of the pension. This view is hardly correct, for the object of attaching a pension to a post is not merely to reward past services, but to attract continuity of service by the holder as well as to enable the employer to dispense with the services of the employé without hardship to him should age or infirmity render him less efficient. Dissatisfaction had been expressed from time to time by members of the English civil service with the system in force, viz. that the benefit of long service was confined only to survivors, and that no advantage accrued to the representatives of those who died in service. This was altered by an act of 1909. See *Royal Commission on Superannuation in the Civil Service: Report and Evidence* (1903). For the general pensions given by the state to the aged poor see OLD AGE PENSIONS.

Civil Service.—In the English civil service the grant of pensions on superannuation is regulated by statute, the four principal acts being the Superannuation Acts of 1834, 1859, 1887 and 1909. To qualify for a pension it is necessary (1) that a civil servant should have been admitted to the service with a certificate from the civil service commissioners, or hold an office specially exempted from this requirement; (2) that he should give his whole time to the public service; (3) that he should draw the emoluments of his office from public funds exclusively; (4) that he should have served for not less than ten years; (5) that if under the age of 60 years he should be certified to be permanently incapable, from infirmity of body or mind, of discharging his official duties, or have been removed from his office on the ground of his inability to discharge his duties efficiently. On retirement on these conditions a civil servant is qualified for a pension calculated at one-eightieth of his retiring salary (or, in certain cases, of his average salary for the last three years) for each complete year of service, subject to a maximum of forty-eightieths. Civil servants retiring on the ground of ill health after less than ten years' service qualify for a gratuity of one month's pay for each year of service. Previous to the Superannuation Act of 1909 the pension was calculated at the rate of one-sixtieth of the retiring salary for each completed year of service, subject to a maximum of forty-sixtieths. This is still the rate for those who entered the service previous to the passing of the act (Sept. 20, 1909) unless they availed themselves of the permission in the act to take advantage of its provisions, which were more than a compensation for the lowering of the rate. The act gave power to the treasury to grant by way of additional allowance to a civil servant who retired after not less than two years' service, in addition to his superannuation, a lump sum equal to one-thirtieth of his annual salary and emoluments multiplied by the number of completed years he has served, so however, that such lump sum does not exceed one and a half times his salary, while if he retires after attaining the age of sixty-five years, there must be deducted from that lump sum one-twentieth for every completed year that he has served after attaining that age. In the case of those who entered the service before the passing of the act, and take advantage of the act, this additional allowance is increased by one-half per cent. for each completed year served at the passing of the act. The act also provided that where a civil servant died after serving five years or upwards, a gratuity equal to his annual salary and emoluments might be granted to his legal personal representatives. Where the civil servant attains the age of sixty-five this gratuity is reduced by one-twentieth for each completed year beyond that age. On the other hand, where the civil servant has retired from the service and all the sums received by him at his death on account of superannuation are less than his annual salary his representatives may receive the difference as a gratuity. Provision was also made in the act for granting compensation on abolition of office, provided that such compensation does not exceed what the recipient might be granted or be entitled to if he retired on the ground of ill health. Pensions are also sometimes awarded in excess of the scale as a reward for special services, as compensation for injury in certain cases, or to holders of professional offices, appointed at an age exceeding that at which public service ordinarily begins. In the estimates for civil services for the year 1909–1910, there was provided for non-effective and charitable services (as pensions and gratuities in lieu of pensions are known as) the sum of £9,625,920; this, however, included an item of £8,750,000 for old-age pensions, leaving a sum of £875,920. There was charged on the Consolidated Fund, on account of pensions and compensation allowance for civil, judicial and other services, a sum of £142,767, while the following sums for civil pensions were provided in the estimates of the several departments: War Office, £158,000; Admiralty, £369,800; Customs and Excise, £412,358; Inland Revenue, £116,096; Post Office, £649,000; Royal Irish Constabulary, £416,500; Dublin Metropolitan Police, £33,646, making a total of £2,298,167, or a gross total for civil pensions of £3,174,087. A return is published annually containing a complete list of the various pensions.

Perpetual or Hereditary Pensions.—Perpetual pensions were freely granted either to favourites or as a reward for political services from the time of Charles II. onwards. Such pensions were very frequently attached as "salaries" to places which were sinecures, or, just as often, posts which were really necessary were grossly overpaid, while the duties were discharged by a deputy at a small salary. Prior to the reign of Queen Anne such pensions and annuities were charged on the hereditary revenues of the sovereign and were held to be binding on the sovereign's successors (*The Bankers' Case*, 1691; *State Trials*, xiv. 3–43). By 1 Anne c. 7 it was provided that no portion of the hereditary revenues could be charged with pensions beyond the life of the reigning sovereign. This act did not affect the hereditary revenues of Ireland and Scotland, and many persons were quartered, as they had been before the act, on the Irish and Scottish revenues who could not be provided for in England—for example, the duke of St Albans, illegitimate son of Charles II., had an Irish pension of £800 a year; Catherine Sedley, mistress of James II., had an Irish pension of £5000 a year; the duchess of Kendall and the countess of Darlington, mistresses of George I., had pensions of the united annual value of £5000, while Madame de Walmoden, a mistress of George II., had a pension of £3000 (Lecky, *History of Ireland in the Eighteenth Century*). These pensions had been granted in every conceivable form—during the pleasure of the Crown, for the life of the sovereign, for terms of years, for the life of the grantee, and for several lives in being or in reversion (Erskine May, *Constitutional History of England*). On the accession of George III. and his surrender of the hereditary revenues in return for a fixed civil list, this civil list became the source from which the pensions were paid. The subsequent history of the civil list will be found under that heading (CIVIL LIST), but it may be here mentioned that the three pension lists of England, Scotland and Ireland, were consolidated in 1830, and the civil pension list reduced to £75,000, the remainder of the pensions being charged on the Consolidated Fund.

In 1887, Charles Bradlaugh, M.P., protested strongly against the payment of perpetual pensions, and as a result a Committee of the House of Commons inquired into the subject (*Report of Select Committee on Perpetual Pensions*, 248, 1887). An appendix to the *Report* contains a detailed list of all hereditary pensions, payments and allowances in existence in 1881, with an explanation of the origin in each case and the ground of the original grant; there are also shown the pensions, &c., redeemed from time to time, and the terms upon which the redemption took place. The nature of some of these pensions may be gathered from the following examples: To the duke of Marlborough and his heirs in perpetuity, £4000 per annum; this annuity was redeemed in August 1884 for a sum of £107,780, by the creation of a ten years' annuity of £12,796, 17s. per annum. By an act of 1806 an annuity of £5000 per annum was conferred on Lord Nelson and his heirs in perpetuity. In 1793 an annuity of £2000 was conferred on Lord Rodney and his heirs. All these pensions were for services rendered, and although justifiable from that point of view, a preferable policy is pursued in the 20th century, by parliament voting a lump sum, as in the cases of Lord Kitchener in 1902 (£50,000) and Lord Cromer in 1907 (£50,000). Charles II. granted the office of receiver-general and controller of the seals of the court of king's bench and common pleas to the duke of Grafton. This was purchased in 1825 from the duke for an annuity of £843, which in turn was commuted in 1883 for a sum of £22,714, 12s. 8d. To the same duke was given the office of the pipe or remembrancer of first-fruits and tenths of the clergy. This office was sold by the duke in 1765, and after passing through various hands was purchased by one R. Harrison in 1798. In 1835 on the loss of certain fees the holder was compensated by a perpetual pension of £62, 9s. 8d. The duke of Grafton also possessed an annuity of £6870 in respect of the commutation of the dues of butlerage and prisage. To the duke of St Albans was granted in 1684 the office of master of the hawks. The sums granted by the original patent were: master of hawks, salary, £391, 1s. 5d.; four falconers at £50 per annum each, £200; provision of hawks, £600; provision of pigeons, hens and other meats, £182, 10s.; total, £1373, 11s. 5d. This amount was reduced by office fees and other deductions to £965, at which amount it stood, until commuted in 1891 for £18,335. To the duke of Richmond and his heirs was granted in 1676 a duty of one shilling per ton on all coals exported from the Tyne for consumption in England. This was redeemed in 1799 for an annuity of £19,000 (chargeable on the consolidated fund), which was afterwards redeemed for £633,333. The duke of Hamilton, as hereditary keeper of the palace, Holyrood House, received a perpetual pension of £45, 10s., and the descendants of the heritable usher of Scotland drew a salary of £242, 10s. The conclusions of the committee were that pensions, allowances and payments should not in future be granted in perpetuity, on the ground that such grants should be limited to the persons actually rendering the services, and that such rewards should be defrayed by the generation benefited; that offices with salaries and without duties, or with merely nominal duties, ought

to be abolished; that all existing perpetual pensions and payments and all hereditary offices should be abolished; that where no service or merely nominal service is rendered by the holder of an hereditary office or the original grantee of a pension, the pension or payment should in no case continue beyond the life of the present holder and that in all cases the method of commutation ought to ensure a real and substantial saving to the nation (the existing rate, about 27 years' purchase, being considered by the committee to be too high). These recommendations of the committee were adopted by the government and outstanding hereditary pensions were gradually commuted, the only ones left outstanding being those to Lord Rodney (£2000) and to Earl Nelson (£5000), both chargeable on the consolidated fund.

Political Pensions.—By the Political Offices Pension Act 1869, pensions were instituted for those who had held political office. For the purposes of the act political offices were divided into three classes: (1) those with a yearly salary of not less than £5000; (2) those with a salary of less than £5000 and not less than £2000; (3) those with a salary of less than £2000 and more than £1000. For service in these offices there may be awarded pensions for life on the following scale: (1) a first class pension not exceeding £2000 a year, in respect of not less than four years' service or its equivalent, in an office of the first class; (2) a second class pension not exceeding £1200, in respect of service of not less than six years or its equivalent, in an office of the second class; (3) a third class pension not exceeding £800 a year, in respect of service of not less than ten years in an office of the third class. The service need not be continuous, and the act makes provision for counting service in lower classes as a qualification for pension in a higher class. These pensions are limited in number to twelve, but a holder must not receive any other pension out of the public revenue, if so, he must inform the treasury and surrender it if it exceeds his political pension, or if under he must deduct the amount. He may, however, hold office while a pensioner, but the pension is not payable during the time he holds office. To obtain a political pension, the applicant must file a declaration stating the grounds upon which he claims it and that his income from other sources is not sufficient to maintain his station in life.

Civil List Pensions.—These are pensions granted by the sovereign from the civil list upon the recommendation of the first lord of the treasury. By 1 & 2 Vict. c. 2 they are to be granted to "such persons only as have just claims on the royal beneficence or who by their personal services to the Crown, or by the performance of duties to the public, or by their useful discoveries in science and attainments in literature and the arts, have merited the gracious consideration of their sovereign and the gratitude of their country." A sum of £1200 is allotted each year from the civil list, in addition to the pensions already in force. From a *Return* issued in 1908 the total of civil list pensions payable in that year amounted to £24,665.

Judicial, Municipal, &c.—There are certain offices of the executive whose pensions are regulated by particular acts of parliament. Judges of the Supreme Court, on completing fifteen years' service or becoming permanently incapacitated for duty, whatever their length of service, may be granted a pension equal to two-thirds of their salary (Judicature Act 1873). The lord chancellor of England however short a time he may have held office, receives a pension of £5000, but he usually continues to sit as a law lord in the House of Lords—so also does the lord chancellor of Ireland, who receives a pension of £3692, 6s. 1d. A considerable number of local authorities have obtained special parliamentary powers for the purpose of superannuating their officials and workmen who have reached the age of 60–65. Poor law officers receive superannuation allowances under the Poor Law Officers Superannuation Acts 1864–1897.

Ecclesiastical Pensions.—Bishops, deans, canons or incumbents who are incapacitated by age or infirmity from the discharge of their ecclesiastical duties may receive pensions which are a charge upon the revenues of the see or cure vacated.

Navy pensions were first instituted by William III. in 1693 and regularly established by an order in council of Queen Anne in 1700. Since then the rate of pensions has undergone various modifications and alterations; the full regulations concerning pensions to all ranks will be found in the quarterly *Navy List*, published by the authority of the Admiralty. In addition to the ordinary pensions there are also good-service pensions, Greenwich Hospital pension and pensions for wounds. An officer is entitled to a pension when he is retired at the age of 45, or if he retires between the ages of 40 and 45 at his own request, otherwise he receives only half pay. The amount of his pension depends upon his rank, length of service and age. The maximum retired pay of an admiral is £850 per annum, for which 30 years' service or its equivalent in half-pay time is necessary; he may, in addition, hold a good service pension of £300 per annum. The maximum retired pay of a vice-admiral, with 29 years' service is £725; of rear-admirals with 27 years' service £600 per annum. Pensions of captains who retire at the age of 55, commanders, who retire at 50, and lieutenants who retire at 45, range from £200 per annum for 17 years service to £525 for 24 years' service. The pensions of other officers are calculated in the same way, according to age and length of service. The good-service pensions consist of ten pensions of £300 per annum for flag-officers, two of which may be held by vice-admirals and two by rear-admirals; twelve of £150 for captains; two of £200 a year and two of £150 a year for engineer officers; three of £100 a year for medical officers of the navy; six of £200 a year for general officers of the Royal Marines and two of £150 a year for colonels and lieutenant-colonels of the same. Greenwich Hospital pensions range from £150 a year for flag officers to £25 a year for warrant officers. All seamen and marines who have completed twenty-two years' service are entitled to pensions ranging from 10d. a day to a maximum of 1s. 2d. a day, according to the number of good-conduct badges, together with the good-conduct medal, possessed. Petty officers, in addition to the rates of pension allowed them as seamen, are allowed for each year's service in the capacity of superior petty officer, 15s. 2d. a year, and in the capacity of inferior petty officer 7s. 7d. a year. Men who are discharged the service on account of injuries and wounds or disability attributable to the service are pensioned with sums varying from 6d. a day to 2s. a day. Pensions are also given to the widows of officers in certain circumstances and compassionate allowances made to the children of officers. In the Navy estimates for 1908–1909 the amount required for half-pay and retired-pay was £868,800, and for pensions, gratuities and compassionate allowances £1,334,600, a total of £2,203,400.

Army.—The system of pensions in the British Army is somewhat intricate, provision being made for dealing with almost every case separately. As a general rule officers can retire after eight years' service on a pension of £100 per annum for ten years, provided that they take commissions in either the Imperial Yeomanry or Special Reserve and attend the annual trainings during that period. The other pensions are as follows: 2nd lieutenants, lieutenants, captains and majors after 15 years' service (or 12 years in the West India regiment), £120, if 45 years of age £200; majors, after 25 years' service, £200. Royal artillery or royal engineers if commissioned, after 21 years of age, £300, if 48 years of age, £300; lieutenant-colonels, after 3 years as such, with 15 years' service, £250, with 27 years' service, £300, with 30 years' service, £365, after term of employment as lieutenant-colonel commanding a unit, or staff appointment as lieutenant-colonel, or after 5 years as lieutenant-colonel cavalry and infantry, £420. Royal artillery, royal engineers and army service corps, £450; *Colonels*, after 5 years as colonel, cavalry and infantry, £420. Royal artillery, royal engineers and army service corps, £450, after completing the term of command of a regimental district or a regiment of foot-guards, or employed in any other capacity for three years, £450–£500 according to age; brevet-colonels, with the substantive rank of lieutenant-colonel, receive, cavalry or infantry, £420; royal artillery, royal engineers and army service corps, £450. Major-generals retire at the age of 62 with a pension of £700; lieutenant-generals at 67 with £850; generals at 67 with £1000.

Officers whose first permanent commission bears date prior to the 1st of January, 1887, retire with a gratuity in lieu of pension.

Officers of the departmental corps retire either with pensions ranging from £1125 yearly to 10s. daily, or with gratuities ranging from £2500 to £1000.

Warrant officers with 5 years' service as such, and 20 years' total service, receive 3s. 6d. per diem if discharged from the service on account of disability, reduction of establishment or age. On discharge for any reasons (except misconduct or inefficiency) they receive from 3s. 6d. to 5s. per diem, according to length of service and corps. If they have less than 5 years' service as warrant officers, but not less than 21 years' total service, they receive at least 3s. per diem; and if discharged at their own request after 18 years' total service, 2s. 7½d.

Additional pensions are given at the rate of 6d. per diem for gallant conduct, and 1½d. to 1s. per diem for re-employed pensioners on completing their second term of employment, with 3d. per diem extra if promoted while so serving. Special pensions are also granted in exceptional cases.

For the purposes of pensions, non-commissioned officers are divided into four classes, corresponding roughly to quartermaster-sergeants, colour-sergeants, sergeants and corporals.

With not more than 21 years' total service, and with the following continuous service in one of the above classes, the rates of pensions (per diem) are:—

Class.	12 years' Service.	9 years' Service.	6 years' Service.	3 years' Service.
	s. d.	s. d.	s. d.	s. d.
I.	2 9	2 6	2 3	2 0
II.	2 6	2 3	2 0	1 9
III.	2 3	2 0	1 9	1 6
IV.	1 8	1 6	1 4	1 0

Privates (Class V.) receive the following pensions:—

21 years' Service.	20 years' Service.	19 years' Service.	18 years' Service.	14 to 18 years' Service.
1s. 1d.	1s. 0d.	11d.	10d.	8d. to 10d.

For service in excess of 21 years, the following amounts are added to the pensions enumerated above :—

	For each complete year in excess of 21 years.
Classes I. to III.	1d. per diem to 9d. per diem.
Classes IV. and V.	½d. per diem to 5d. per diem.

A man promoted to higher rank within one year of his completing 21 years' service, receives, on his discharge in the higher rank, an extra 3d. per diem, provided that he has completed 25 years' service in all. An additional pension of 6d. per diem is awarded for gallant conduct, as in the case of warrant officers.

N.C.O.'s and men disabled through military service, are granted the following pensions :—

If partially capable of earning a livelihood	Per diem.
Class I. to III.	1s. to 3s.
„ IV.	9d. to 2s.
„ V.	6d. to 1s. 6d.
If totally incapable of earning a livelihood	**Per diem.**
Class I. to III.	2s. 6d. to 3s. 6d.
„ IV.	2s. od. to 3s. od.
„ V.	1s. 6d. to 2s. 6d.

Pensions may also be granted to N.C.O.'s and men who are disabled by causes other than military service, according to circumstances.

United States.

In the ordinary sense of the word, pensions in the United States are confined to federal judges and officers of the army and navy, but the United States "Pension Fund" is so singular a feature of the national budget, that it is desirable to give an account of the different classes of allowances which are granted. In the United States allowances for services in wars prior to the 4th of March 1861 are called "old war" pensions, and may be divided into three classes, viz. (1) invalid pensions, based upon wounds or injuries received, or disease contracted in the course of duty, (2) "service" pensions, and (3) land bounties, both granted for service irrespective of injuries.

The first provision made by Congress for pensions was a resolution passed on the 26th of August 1776, promising invalid pensions to officers and men of the army or navy who lost a limb or were otherwise disabled in the War of Independence, at a rate equal to half of their monthly pay as officers or soldiers during life or continuance of the disability, those not totally disabled to receive an adequate monthly pension not to exceed half of their pay. Then followed various Acts of Congress enlarging the provisions for invalid pensions and extending them to those who had been in the war of 1812, and to the widows and children of those who died in the war or from wounds received in the war. The act of the 3rd of May 1846, provided for the prosecution of the war with Mexico and for pensioning those volunteers wounded or otherwise disabled in service. Other acts were subsequently passed making further provision for pension on account of service in the Mexican War. The first general law granting "service" pensions was not passed until the 18th of March 1818, thirty-five years after the termination of the War of Independence. Its beneficiaries were required to be in indigent circumstances and in need of assistance from their country. Two years later Congress became alarmed by reason of the large number of claims filed (about 8000), and enacted what was known as the "Alarm Act," requiring each applicant for pension and each pensioner on the rolls to furnish a schedule of his whole estate and income, clothing and bedding excepted. Many pensioners were dropped who were possessed of as much as $150 worth of property. Numerous acts were, however, passed from time to time liberalizing the law or dealing more generously with the survivors of the Revolution. Service pensions were not granted to widows of the soldiers of this war until 1836, and then only for a period of five years and on condition that the marriage of the soldier was prior to his last service, and that the soldier's service was not less than six months. In 1853, seventy years after the close of the war, the limitation as to the time of marriage was removed. The rolls in 1901 contained nine and in 1908 two pensions based upon service in the War of Independence. The last survivor was Daniel F. Bakeman, who died on the 5th of April 1869, aged 109 years and 6 months.

The first law granting service pensions on account of the war of 1812 was passed in 1871, fifty-six years after the close of the war. This act required sixty days' service. Widows were not pensionable unless the marriage to the soldier had taken place prior to the treaty of peace of 15th February 1815. On 9th March 1878, sixty-three years after the war, an act was passed reducing the requisite period of service to fourteen days and removing the limitations as to date of marriage. In 1908 the pension rolls contained the names of 471 widows of this war, the last male survivor having died in 1905, at the age of 105 years. Service pensions were provided for those who served in the Black Hawk War, Creek War, Cherokee disturbances and the Seminole War (1832 to 1842), on the 27th of July 1892, fifty years after the period embraced in the act; they were granted to those who had served for thirty days and were honourably discharged, and to their widows. In 1908 there were 1820 survivors and 3018 widows, pensioners of the Indian wars. Service pensions were granted to the survivors of the war with Mexico by an act passed on the 29th of January 1887, thirty-nine years after the Guadeloupe-Hidalgo treaty. The pensions were granted to those who were honourably discharged and to the widows, for service of sixty days, if sixty-two years of age, or disabled or dependent. This law was liberalized by the acts of the 5th of January 1893, 23rd of April 1900, 6th of February 1907, and 19th of April 1908, increasing the pension to $15 for those who have reached the age of seventy years, and to $20 for those seventy-five years and over. In 1908 the pension rolls contained the names of 2932 survivors and 6914 widows on account of service in the Mexican War. To give title to bounty land, service must have been for at least fourteen days or in a battle prior to 3rd March 1855; and if in the navy or regular army, must have been in some war in which the United States was engaged. Bounty land warrants are issued for 160 acres, and over 70,000,000 acres have been granted under the different Bounty Land Acts.

For services rendered in the Civil War (1861–65) in the army or navy of the United States, or in their various branches, the law provided two distinct systems of pensioning—(1) the general laws, granting pensions for wounds or injuries received, or disease contracted in service in the line of duty, the pensions ranging from $6 to $100 per month; and (2) the so-called Dependent Pension Act and amending acts, granting pensions for permanent disabilities regardless of the time and manner of their origin, provided they were not the result of vicious habits, the pensions ranging from $6 to $12 per month. What is known as the general law for disabilities incurred in service and in the course of duty was constituted in the act of the 14th of July 1862, as amended by the act of the 3rd of March 1873. Under its provisions the following classes of persons are entitled to benefit, viz. any officer of the army, navy or marine corps, or any enlisted man in the military or naval service of the United States, whether regularly mustered or not; any master or any pilot, engineer, sailor or other person not regularly mustered, serving upon any gunboat or war-vessel of the United States; any acting assistant or contract surgeon; any provost-marshal, deputy provost-marshal or enrolling officer; subject to the several conditions in each particular case prescribed in the law. This law also embraces in its provisions the following classes, each class being subject to certain specified conditions, viz. widows, children under sixteen years of age, dependent parents, and brothers and sisters. This act has been the subject of numerous amendments along more liberal lines. As an illustration a case may be cited where a soldier lost both hands in the service in the course of duty, and was discharged in 1862. He is entitled to a pension of $8 per month from the date of his discharge. Under subsequent acts he is entitled to $25 per month from 4th July 1864; $31.25 from 4th June 1872; $50 from 4th June 1874; $72 from 17th June 1878, and $100 from 12th February 1889.

Under the general law a widow or dependent relative could not be pensioned unless the cause of the soldier's death originated in service in the line of duty; if it were so shown, a widow might be pensioned whether she were rich or poor. Upon the death or remarriage of the widow the minor children of the soldier under the age of sixteen years become entitled to pension. If the soldier died of causes due to his service, and left no widow or minor children, his other relatives become entitled, if dependent, in the following order, viz. : first, the mother; secondly, the father; thirdly, orphan sisters and brothers under sixteen years of age, who shall be pensioned jointly. In 1908 the number of invalids pensioned under the general law was 142,044, and the number of widows and dependent relatives was 81,168.

The so-called Dependent Pension Act was based upon an Act of Congress approved 27th June 1890, which was amended on 9th May 1900. Properly speaking, it might be called "dependent" only as regards widows and parents. The main conditions as to the soldier or sailor were, ninety days' service, an honourable discharge, and a permanent disability from disease or otherwise, not the result of his own vicious habits, to such an extent as to render him unable to maintain himself by manual labour. The rates of pension under this act were $6, $8, $10 and $12 per month. Widows became entitled under this law if they married the soldier or sailor prior to 27th June 1890, provided they were without means of support other than their daily labour, and an actual net income not exceeding $250 per year, and had not remarried. Claims of children under sixteen years of age were governed by the same conditions as applied to claims of widows, except that their dependence was presumed, and need not be shown by evidence. If a minor child was insane, idiotic or otherwise physically or mentally helpless, the pension continued during the life of said child or during the period of disability. Further acts made more liberal provisions. That of the 6th of February 1907 granted pensions

to persons who had served ninety days or more in the military or naval service in the Civil War, or sixty days in the Mexican War, and were honourably discharged, no other conditions being attached. The rate of pension was fixed at $12 per month when sixty two years of age, $15 per month when seventy years of age and $20 per month when seventy-five years of age. The act of April 1908, fixed the rate of pension for widows, minor children under the age of sixteen and helpless minors on the roll or afterwards to be placed on it at $12 per month, and granted pensions at the same rate to the widows of persons who served ninety days or more during the Civil War, without regard to their pecuniary condition. In 1908 there were 140,600 invalids on the roll, and 4294 minor and helpless children. In the same year under the act of 1907 there were 338,341 dependants, while under the act of 1908, 188,445 widows were put on the roll. All women employed by competent authority as nurses during the Civil War for six months or more, who are unable to earn a support, are granted a pension of $12 per month by an act of the 5th of August 1892. In 1908 the pension rolls contained the names of 3110 pensioners under this act.

There were on the roll in 1908 on account of the Spanish War, 11,786 invalids and 3722 dependents. The total amount paid in pensions in 1908 on account of that war and the insurrection in the Philippine Islands was $3,654,122. The grand total of pensioners on the roll for all wars was, in 1908, 951,687.

In addition to pensions, the United States government grants the following gratuities: *First:* If a soldier lost a limb in the service, or as a result of his service in line of duty, he is furnished with an artificial limb free of cost every three years, or commutation therefor, and transportation to and from a place where he shall select the artificial limb. *Second:* An honourably discharged soldier or sailor is given preference for appointment to places of trust and profit, and preference for retention in all civil service positions. *Third:* There are ten National Soldiers' Homes situated at convenient and healthy points in different parts of the country, where comfortable quarters, clothing, medical attendance, library and amusements of different kinds are provided free of all expense; government providing the soldiers free transportation to the home, continuing payments of pension while they are members of the home, and increasing the same as disabilities increase. *Fourth:* There are thirty homes maintained by the different states, which are similar in their purpose to the National Homes, the sum of $100 per year being paid by the general government for each inmate. Many of these state homes also provide for the wives and children of the inmates, so that they need not be separated while they are members of such home. *Fifth:* Schools are established by the different states for the maintenance and education of soldiers' orphans until they attain the age of sixteen years.

From the close of the Civil War in 1865 to 1908, the government of the United States paid to its pensioners for that war the sum of $3,533,593,025. The payments on account of all wars for the fiscal year ended on the 30th of June 1908 were $153,093,086. Over $17,000,000 has been paid to surgeons for making medical examinations of pensioners and applicants for pensions. The total disbursement for pensions from 1790 to 1908 amounted to $3,751,108,809. No other nation or government in all time has dealt so liberally with its defenders.

The money appropriated by Congress for the payment of pensions is disbursed by eighteen pension agents established in different parts of the country. Pensions are paid quarterly, and the agencies are divided into three classes, one of which pays on the 4th of every month.

PENSIONARY, a name given to the leading functionary and legal adviser of the principal town corporations of Holland, because they received a salary, or pension. At first this official was known, by the name of "clerk" or "advocate." The office originated in Flanders. The earliest "pensionaries" in Holland were those of Dort (1468) and of Haarlem (1478). The pensionary conducted the legal business of the town, and was the secretary of the town council and its representative and spokesman at the meetings of the Provincial States. The post of pensionary was permanent and his influence was great.

In the States of the province of Holland the pensionary of the order of nobles (*Ridderschap*) was the foremost official of that assembly and he was named—until the death of Oldenbarneveldt in 1619—the land's advocate, or more shortly, the advocate. The importance of the advocate was much increased after the outbreak of the revolt in 1572, and still more so during the long period 1586–1619 when John van Oldenbarneveldt held the office. The advocate drew up and introduced all resolutions, concluded debates and counted the votes in the Provincial Assembly. When it was not in session he was a permanent member of the college of deputed councillors who carried on the administration. He was minister of justice and of finance. All correspondence passed through his hands, and he was the head and the spokesman of the deputation, who represented the province in the States-General. The conduct of foreign affairs in particular was entrusted almost entirely to him.

After the downfall of Oldenbarneveldt the office of lands'-advocate was abolished, and a new post, tenable for five years only, was erected in its place with the title of *Raad-Pensionaris*, or Pensionary of the Council, usually called by English writers Grand Pensionary. The first holder of this office was Anthony Duyck. Jacob Cats and Adrian Pauw, in the days of the stadtholders Frederick Henry and William of Orange II. had to be content with lessened powers, but in the stadtholderless régime 1650–1672 the grand pensionary became even more influential than Oldenbarneveldt himself, since there was no prince of Orange filling the offices of stadtholder, and of admiral and captain-general of the Union. From 1653–1672 John de Witt, re-elected twice, made the name of grand pensionary of Holland for ever famous during the time of the wars with England. The best known of his successors was Anthony Heinsius, who held the office from 1688 to his death in 1720. He was the intimate friend of William III., and after the decease of the king continued to carry out his policy during the stadtholderless period that followed. The office was abolished after the conquest of Holland by the French in 1795.

See Robert Fruin, *Geschiedenis der Staats-Instellingen in Nederland*, The Hague, 1901; G. W. Vreede, *Inleiding tot eene Gesch. der Nederlandsche Diplomatie* (Utrecht, 1858). (G. E.)

PENTAMETER, the name given to the second and shorter line of the classical elegiac verse. It is composed of five (πέντε) feet or measures (μέτρα), and is divided into two equal parts of two and a half feet each: the second of these parts must be dactylic, and the first may be either dactylic or spondaic. The first part must never overlap into the second, but there must be a break between them. Thus:

$$\begin{array}{c|c|c||c|c|c|} - \smile \smile & - \smile \smile & - & - \smile \smile & - \smile \smile & - \\ - \; - & - \; - & & & & \end{array}$$

In the best Latin poets, the first foot of each part of the pentameter is a dactyl. The pentameter scarcely exists except in conjunction with the hexameter, to which it always succeeds in elegiac verse. The invention of the rigidly dactylic form was attributed by the Greeks to Archilochus. Schiller described the sound and method of the elegiac couplet in two very skilful verses, which have been copied in many languages:

Im Hexameter steigt des Springquells flüssige Säule,
Im Pentameter drauf fällt sie melodisch herab.

The pentameter was always considered to add a melancholy air to verse, and it was especially beloved by the Greeks in those recitations (ῥαψῳδεῖται) to the sound of the flute, which formed the earliest melodic performances at Delphi and elsewhere.

PENTASTOMIDA, or LINGUATULINA, vermiform entoparasitic animals, of which the exact zoological position is unknown, although they are usually regarded as highly modified degenerate Arachnida of the order Acari.

The body is sub-cylindrical or somewhat convex above, flatter below, broad and oval in front and narrowed and elongate behind. Its integument is marked by a large number of transverse grooves simulating the segmentation of Annelids, and near the anterior extremity close to the mouth are two pairs of recurved chitinous hooks. The alimentary canal is a simple tube traversing the body from end to end, the anus opening at the extremity of its narrowed tail-like termination. The nervous system is represented by an oesophageal collar and a suboesophageal ganglion, whence paired nerves pass outwards to innervate the anterior extremity and backwards towards its posterior end. No respiratory or circulatory organs are known. The sexes are distinct but dissimilar in size, the female being usually much larger than the male. The generative organs occupy a large part of the body cavity. In the female the ovary is a large unpaired organ from the anterior end of which arise two oviducts, and connected with the latter are a pair of large so-called copulatory pouches, which perhaps act as receptacula seminis. These, and the oviducts lie on the anterior half of the body; but the oviducts themselves soon unite to form a single tube of great length, which runs backwards to its posterior extremity, terminating in the genital orifice close to the anus.

in the male, on the contrary, this orifice is situated in the anterior half of the body, not far behind the mouth. The orifice leads into a large pouch lodging a pair of very long penes, which are coiled up when not in use. The two testicles, which extend far back into the posterior part of the body, are long and tubular. Anteriorly their vasa deferentia soon unite into a common duct, which opens into the pouch containing the penes. Also communicating with this pouch is a pair of long slender flagelliform tubes, of which the function is unknown.

The structure of the adult *Linguatula* or *Pentastomum*, above described, does not supply convincing evidence of relationship with the Acari. At the same time some Acari, like *Eriophyes* (*Phytoptus*) and *Demodex*, have the body elongated and annulated, but in these groups the elongation of the body is caudal or post-anal, as is attested by the position of the anus far forwards on its ventral surface. Again, the adult *Pentastomum* shows no trace of appendages, unless the two pairs of chitinous hooks are to be regarded as the vestiges of jaws or ambulatory limbs. In the embryo, however, what have been regarded as remnants of limbs may be seen.

In the mature stage Pentastomida live in the respiratory passages of mammalia, principally in the nasal cavities. The remarkable life-history of one species, *Linguatula taenioides*, has been worked out in detail and presents a close analogy to that of some Cestodes. The adults live in the nose of dogs, where they have been known to survive over fifteen months. Each female lays a vast number of eggs, about 500,000 being the estimated amount. These are expelled along with mucus by the sneezing of the host. If they fall on pasture land or fodder of any kind and are eaten by any herbivorous animal, such as a hare, rabbit, horse, sheep or ox, the active embryos or larvae are set free in the alimentary canal of the new host.

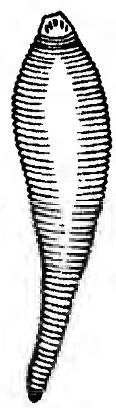

FIG. 1.—*Linguatula taenioides*, Rud. adult.

FIG. 2.—The same, in the first larval stage; under side. *a* . . . *a*, Leg-like processes.

These larvae are minute oval creatures with a comparatively short apically fringed caudal prolongation and furnished with two pairs of short two-clawed processes, which may represent the limbs of anthropods and possibly the two pairs of legs found in Acari of the family Eriophyidae. The larva is also armed anteriorly with a median piercing probe and a pair of sharp hooks by means of which it perforates the walls of the alimentary tract and makes its way into the body cavity, lungs or liver. Here it becomes encysted, and losing its boring apparatus and claw-bearing processes remains for a time quiescent. After a series of moults it passes into the second larval stage, somewhat like the parent but differing in having each integumental ring armed with a fringe of backwardly directed short bristles. This sexually immature stage, regarded at one time as representing a distinct species and named *Linguatula denticulata*, is reached in about six or seven months and measures from 6 to 8 mm. in length. In the event of the host escaping being killed and eaten it is believed that some of these larvae wander about or ultimately make their way to the exterior, possibly through the bronchi; nevertheless it seems to be certain that they can only reach sexual maturity in the nasal passages of some carnivorous animal, and the chance of attaining this environment is afforded when the viscera of the host are devoured by some flesh-eating mammal.

The adult female of *L. taenioides* measures about 4 in. long and the male barely one-fourth of that. The adult and immature stages are, however, by no means confined respectively to carnivorous and herbivorous species of mammals. The adult stage, for example, has been found in the nasal passages of sheep, goats, horses and even of man, and the larval stage in the pleural and peritoneal cavities of dogs and cats. (R. I. P.)

PENTATEUCH, the name found as early as in Tertullian and Origen corresponding to the Jewish חמשה חומשי התורה (the five-fifths of the Torah, or Law), and applied to the first five books of the Old Testament (Genesis, Exodus, Leviticus, Numbers, Deuteronomy). The several books were named by the Jews from their initial words, though at least Leviticus, Numbers and Deuteronomy had also titles resembling those we use, viz. תורת כהנים, חמש הפקודים (Αμμεσφεκωδειμ, Origen, in Eus., *H. E.* vi. 25), and משנה תורה. The Pentateuch, together with Joshua, Judges and Ruth, with which it is usually united in Greek MSS., makes up the Octateuch; the Pentateuch and Joshua together have recently been named the Hexateuch. On the critical questions arising from the Pentateuch or Hexateuch, see BIBLE and the articles on the several books.

PENTECOST, a feast of the Jews, in its original meaning a "harvest feast," as consisting of the first-fruits of human toil (Exod. xxiii. 16), extending over the seven weeks which fairly correspond with the duration of the Canaanite harvest. Hence it was the closing feast of the harvest gladness.

The agricultural character of this feast clearly reveals its Canaanite origin (see HEBREW RELIGION). It does not, however, rank equal in importance with the other two agricultural festivals of pre-exilian Israel, viz. the *Maṣṣōth* or feast of unleavened cakes (which marked the beginning of the corn-harvest), and the *Asīph* ("ingathering," later called *succōth*, "booths"), which marked the close of all the year's ingathering of vegetable products. This is clear in the ideal scheme of Ezekiel (xlv. 21 seq.), in which, according to the original text, Pentecost is omitted (see Cornill's revised text and his note *ad loc.*). It is a later hand that has inscribed a reference to the "feast of weeks" which is found in our Massoretic Hebrew text. Nevertheless occasional allusions to this feast, though secondary, are to be found in Hebrew literature, *e.g.* Isa. ix. 3 (2 Heb.) and Ps. iv. 7 (8 Heb.).

In both the early codes, viz. in Exod. xxiii. 16 (E) and in Exod. xxxiv. 22 (J, in which the harvest festival is called "feast of weeks"), we have only a bare statement that the harvest festival took place some weeks after the opening spring festival called *Maṣṣōth*. It is in Deut. xvi. 9 that we find it explicitly stated that *seven* weeks elapsed between the beginning of the corn-harvest ("when thou puttest the sickle to the corn") and the celebration of the harvest festival (*Ḳāṣīr*). We also note the same generous inclusion of the household slaves and of the resident alien as well as the fatherless and widow that characterizes the autumnal festival of "Booths."

But when we pass to the post-exilian legislation (Lev. xxiii. 10–21; cf. Num. xxviii. 26 seq.) we enter upon a far more detailed and specific series of ritual instructions. (1) A special ceremonial is described as taking place on "the morrow after the Sabbath," *i.e.* in the week of unleavened cakes. The first-fruits of the harvest here take the form of a sheaf which is waved by the priest before Yahweh. (2) There is the offering of a male lamb of the first year without blemish and also a meal offering of fine flour and oil mixed in defined proportions as well as a drink-offering of wine of a certain measure. After this "morrow after the Sabbath" seven weeks are to be reckoned, and when we reach the morrow after the seventh Sabbath fifty days have been enumerated. Here we must bear in mind that Hebrew numeration always includes the day which is the *terminus a quo* as well as that which is *term. ad quem*. On this fiftieth day two wave-loaves made from the produce of the fields occupied by the worshipper ("your habitations") are offered together with seven unblemished lambs of the first year as well as one young bullock and two rams as a burnt-offering. We have further precise details respecting the sin-offering and the peace-offerings which were also presented.[1] This elaborate ceremonial connected with the wave-offering (developed in the post-exile period) took place on the morrow of the seventh Sabbath called

[1] On the critical questions involved in these ritual details of Lev. xxiii. 18 as compared with Num. xxviii. 27–30 cf. Driver and White in *S. B. O. T.*, note on Lev. xxiii. 18.

a "day of holy convocation" on which no servile work was to be done. It was called a "fiftieth-day feast." Pentecost or "Fiftieth" day is only a Greek equivalent of the last name (πεντηκοστή) in the Apocrypha and New Testament. The orthodox later Jews reckoned the fifty days from the 16th of Nisan, but on this there has been considerable controversy among Jews themselves. The orthodox later Jews assumed that the Sabbath in Lev. xxiii. 11, 15 is the 15th Nisan, or the first day of the feast of Maṣṣōth. Hitzig maintained that in the Hebrew calendar 14th and 21st Nisan were always Sabbaths, and that 1st Nisan was always a Sunday, which was the opening day of the year. "The morrow after the Sabbath" means, according to Hitzig, the day after the weekly Sabbath, viz. 22nd Nisan. Knobel (*Comment. on Leviticus*) and Kurtz agree with Hitzig's premises but differ from his identification of the Sabbath. They identify it with the 14th Nisan. Accordingly the "day after" falls on the 15th. (See Purves's article, "Pentecost," in Hastings's *Dict. of the Bible*, and also Ginsburg's article in Kitto's *Cyclopaedia*). Like the other great feasts, it came to be celebrated by fixed special sacrifices. The amount of these is differently expressed in the earlier and later priestly law (Lev. xxiii. 18 seq.; Num. xxviii. 26 seq.); the discrepancy was met by adding the two lists. The later Jews also extended the one day of the feast to two. Further, in accordance with the tendency to substitute historical for economic explanations of the great feasts, Pentecost came to be regarded as the feast commemorative of the Sinaitic legislation.

To the Christian Church Pentecost acquired a new significance through the outpouring of the Spirit (Acts ii.). (See WHITSUNDAY.)

It is not easy to find definite parallels to this festival in other ancient religious cults. The Akitu festival to Marduk was a spring festival at the beginning of the Babylonian year (Nisan). It therefore comes near in time to the feast of unleavened cakes rather than to the later harvest festival in the month Sivan called "feast of weeks." Zimmern indeed connects the Akitu festival with that of Purim on the 15th Adar (March); see *K.A.T.*[3] p. 514 seq. Also the Roman Cerealia of April 12th–19th rather correspond to *Maṣṣōth* than to *Ḳāṣīr*. (O. C. W.)

PENTELICUS (Βριλησσός, or Πεντελικὸν ὄρος from the deme Πεντέλη; mod. Mendeli), a mountain to the N.E. of the Athenian plain, height 3640 ft. Its quarries of white marble were not regularly worked until after the Persian wars; of this material all the chief buildings of Athens were constructed, as well as the sculpture with which they were ornamented. The ancient quarries are mostly on the south side of the mountain. The best modern quarries are on the north side. The top of Pentelicus commands a view over the plain of Marathon, and from it the Athenian traitors gave the signal to the Persians by a flashing shield on the day of the battle. There was a statue of Athena on the mountain.

PENTHEUS, in Greek legend, successor of Cadmus as king of Thebes. When Dionysus, with his band of frenzied women (Maenads) arrived at Thebes (his native place and the first city visited by him in Greece), Pentheus denied his divinity and violently opposed the introduction of his rites. His mother Agavē having joined the revellers on Mount Cithaeron, Pentheus followed and climbed a lofty pine to watch the proceedings. Being discovered he was torn to pieces by Agave and others, who mistook him for some wild beast. His head was carried back to Thebes in triumph by his mother. Labdacus and Lycurgus, who offered a similar resistance, met with a like fearful end. Some identify Pentheus with Dionysus himself in his character as the god of the vine, torn to pieces by the violence of winter. The fate of Pentheus was the subject of lost tragedies by Thespis and Pacuvius.

See Euripides, *Bacchae, passim*; Ovid, *Metam.* iii. 511; Theocritus xxvi.; Apollodorus iii. 5, 2; Nonnus, *Dionysiaca*, xliv.–xlvi.; on representations in art see O. Jahn, *Pentheus und die Mainaden* (1841).

PENTHIÈVRE, COUNTS OF. In the 11th and 12th centuries the countship of Penthièvre in Brittany (dep. of Côtes-du-Nord) belonged to a branch of the sovereign house of Brittany. Hen d'Avaugour, heir of this dynasty, was dispossessed of the coun ship in 1235 by the duke of Brittany, Pierre Mauclerc, who ga it as dowry to his daughter, Yolande, on her marriage in 12 to Hugh of Lusignan, count of La Marche. Duke John of Brittany, Yolande's brother, seized the countship on h death in 1272. In 1337 Joan of Brittany brought Penthièv to her husband, Charles de Châtillon-Blois. In 1437 Nicole Blois, a descendant of this family, married Jean de Brosse, an was deprived of Penthièvre by the duke of Brittany, Francis II in 1465. The countship, which was restored to Sebastian Luxemburg, heir of the Brosses through his mother, was erecte for him into a duchy in the peerage of France (*duché-pairi* in 1569, and was afterwards held by the duchess of Mercœu daughter of the first duke of Penthièvre, and then by her daughte the duchess of Vendôme. The duchess of Vendôme's grandso Louis Joseph, inherited Penthièvre in 1669, but it was take from him by decree in 1687 and adjudged to Anne Marie d Bourbon, princess of Conti. In 1696 it was sold to the coun of Toulouse, whose son bore the title of duke of Penthièvr This title passed by inheritance to the house of Orleans.

PENTHOUSE, a sloping roof attached to a building eithe to serve as a porch or a covering for an arcade, or, if supporte by walls, as a shed, a "lean-to." In the history of siegecraf the word is particularly applied to the fixed or movable construc tions used to protect the besiegers when mining, working batter ing-rams, catapults, &c., and is thus used to translate Lat *vinea* and *pluteus*, and also *testudo*, the shelter of locked shield of the Romans. The Mid. Eng. form of the word is *pentis*, a adaptation of O. Fr. *apentis*, Med. Lat. *appenditium* or *appen dicium*, a small structure attached to, or dependent on, anothe building, from *appendere*, to hang on to. The form "pent house" is due to a supposed connexion with "house" and Fr *pente*, sloping roof. The more correct form "pentice" is no frequently used.

PENTSTEMON, in botany, a genus of plants (nat. orde Scrophulariaceae), chiefly natives of North America, wit showy open-tubular flowers. The pentstemon of the floris has, however, sprung from *P. Hartwegii* and *P. Cobaea*, an possibly some others. The plants endure English winter unharmed in favoured situations. They are freely multiplie by cuttings, selected from the young side shoots, planted early in September, and kept in a close cold frame till rooted. The winter safely in cold frames, protected by mats or litter during frost. They produce seed freely, new kinds being obtained by that means. When special varieties are not required true from cuttings, the simplest way to raise pentstemons is to sow seed in heat (65° F.) early in February, afterwards pricking the seedlings out and hardening them off, so as to be ready for the open air by the end of May. Plants formerly known under the name of Chelone (*e.g. C. barbata, C. campanulata*) are now classed with the pentstemons.

PENUMBRA (Lat. *paene*, almost, *umbra*, a shadow), in astronomy, the partial shadow of a heavenly body as cast by the sun. It is defined by the region in which the light of the sun is partially but not wholly cut off through the interception of a dark body. (See ECLIPSE.)

PENZA, a government of eastern Russia, bounded N. by the government of Nizhniy-Novgorod, E. by Simbirsk, and S. and W. by Saratov and Tambov; area, 14,992 sq. m.; pop. (est. 1906), 1,699,000. The surface is undulating, with deep valleys and ravines, but does not exceed 900 ft. above sea-level. It is principally made up of Cretaceous sandstones, sands, marls and chalk, covered in the east by Eocene deposits. Chalk, potter's clay, peat and iron are the chief mineral products in the north. The soil is a black earth, more or less mixed with clay and sand; marshes occur in the Krasnoslobodsk district; and expanses of sand in the river valleys. There are extensive forests in the north, but the south exhibits the characteristic features of a steppeland. The government is drained by the Moksha, the Sura (both navigable) and the Khoper, belonging to the Oka, Volga and Don systems. Timber is floated down

several smaller streams, while the Moksha and Sura are important means of conveyance. The climate is harsh, the average temperature at the city of Penza being only 38°. The population consists principally of Russians, together with Mordvinians, Meshcheryaks and Tatars. The Russians profess the Orthodox Greek faith, and very many, especially in the north are Raskolniks or Nonconformists. The chief occupation is agriculture. The principal crops are rye, oats, buckwheat, hemp, potatoes and beetroot. Grain and flour are considerable exports. The local authorities have established dépôts for the sale of modern agricultural machinery. There are several agricultural and horticultural schools, and two model dairy-farms. Cattle breeding and especially horse-breeding are comparatively flourishing. Market-gardening is successfully carried on, and improved varieties of fruit-trees have been introduced through the imperial botanical garden at Penza and a private school of gardening in the Gorodishche district. Sheep-breeding is especially developed in Chembar and Insar. The Mordvinians devote much attention to bee-keeping. The forests (22% of the total area) are a considerable source of wealth, especially in Krasnoslobodsk and Gorodishche. The manufactures are few. Distilleries come first, followed by beet sugar and oil mills, with woollen cloth and paper mills, tanneries, soap, glass, machinery and iron-works. Trade is limited to the export of corn, spirits, timber, hempseed-oil, tallow, hides, honey, wax, woollen cloth, potash and cattle, the chief centres for trade being Penza, Nizhni-Lomov, Mokshany, Saransk and Krasnoslobodsk.

The government is divided into ten districts, the chief towns of which are Penza, Gorodishche, Insar, Kerensk, Krasnoslobodsk, Mokshany, Narovchat, Nizhni-Lomov, Saransk and Chembar. The present government of Penza was formerly inhabited by Mordvinians, who had the Mescheryaks on the W. and the Bulgars on the N. In the 13th century these populations fell under the dominion of the Tatars, with whom they fought against Moscow. The Russians founded the town of Moskshany in 1535. Penza was founded in the beginning of the 17th century, the permanent Russian settlement dating as far back as 1666. In 1776 it was taken by the rebel Pugashev. The town was almost totally destroyed by conflagrations in 1836, 1839 and 1858.

PENZA, a town of Russia, capital of the government of the same name, 492 m. by rail S.E. from Moscow. It stands on a plateau 567 ft. above the sea, at the confluence of the Penza with the navigable Sura. Pop. (1897), 61,851. The older parts of the town are constructed of wood, but the newer parts are well built. The cathedral was erected in 1820–1821. Penza has technical schools, public libraries, a museum of antiquities, and a theatre which has played some part in the history of the Russian stage. The bulk of the inhabitants support themselves by agriculture or fishing in the Sura. An imperial botanical garden is situated within two miles of the town. Apart from paper-mills and steam flour-mills, the manufacturing establishments are small. There is a trade in corn, oil, tallow, timber and spirits, and two fairs where cattle and horses are sold.

PENZANCE, a municipal borough, market town and seaport in the St Ives parliamentary division of Cornwall, England, the terminus of the Great Western railway, 325½ m. W.S.W. of London. Pop. (1901), 13,136. It is finely situated on the western shore of Mount's Bay, opposite St Michael's Mount, being the westernmost port in England. The site of the old town slopes sharply upward from the harbour, to the west of which there extends an esplanade and modern residential quarter; for Penzance, with its mild climate, is in considerable favour as a health resort. The town has no buildings of great antiquity, but the public buildings (1867), in Italian style, are handsome. By the market house is a statue of Sir Humphry Davy, who was born here in 1778. Among institutions there are a specially fine public library, museums of geology and natural history and antiquities, mining and science schools, the West Cornwall Infirmary and a meteorological station. The harbour, enclosed within a breakwater, has an area of 24 acres, with 12 to 16 ft. depth of water, and floating and graving docks. There is a large export trade in fish, including that of pilchards to Italy. Other exports are tin and copper, granite, serpentine, vegetables and china clay. Imports are principally coal, iron and timber. Great quantities of early potatoes and vegetables, together with flowers and fish, are sent to London and elsewhere. The borough is under a mayor, 6 aldermen and 18 councillors. Area, 355 acres.

Nearly two miles inland to the north-west is MADRON (an urban district with a population of 3486). The church of St Maddern is principally Perpendicular, with earlier portions and a Norman front. Near the village a "wishing well" of ancient fame is seen, and close to it the ruins of a baptistery of extreme antiquity. Monoliths and cromlechs are not uncommon in the neighbourhood. Three miles north-east is the urban district of LUDGVAN (pop. 2274), and to the south is PAUL (6332), which includes the village of Newlyn (*q.v.*).

Penzance (Pensans) was not recognized as a port until the days of the Tudors, but its importance as a fishing village dates from the 14th century. In 1327 thirty burgesses in Penzance and thirteen boats paying 13s. yearly are found among the possessions of the lords of Alverton, of which manor it formed a portion of the demesne lands. The year 1512 marks the beginning of a new era. Until then St Michael's Mount had been regarded as the port of Mounts Bay; but in that year Henry VIII. granted the tenants of Penzance whatever profits might accrue from the "ankerage, kylage and busselage" of ships resorting thither, so long as they should repair and maintain the quay and bulwarks for the safeguard of the ships and town. Nevertheless thirty years later it is described by Leland as the westernmost market town in Cornwall "with no socur for Botes or shippes but a forsed Pere or Key." During the war with Spain the town was devastated in 1595. The charter of incorporation granted in 1614 states that by the invasion of the Spaniards it had been treacherously spoiled and burnt but that its strength, prosperity and usefulness for navigation, and the acceptable and laudable services of the inhabitants in rebuilding and fortifying it, and their enterprise in erecting a pier, have moved the king to grant the petition for its incorporation. This charter provides for a mayor, eight alderman and twelve assistants to constitute the common council, the mayor to be chosen by the council from the aldermen, the aldermen to be chosen from the assistants, and the assistants from the most sufficient and discreet of the inhabitants. It also ratified Henry's grant of anchorage, keelage and busselage. In 1663 Penzance was constituted a coinage town for tin. It has never enjoyed independent parliamentary representation. In 1332 a market on Wednesdays and a fair at the Feast of St Peter ad Vincula were granted to Alice de Lisle, and in 1405 this market was ratified and three additional fairs added, viz. at the feasts of St Peter in Cathedra and the Conception and Nativity of the Blessed Virgin. The charter of 1614 substituted markets on Tuesdays and Thursdays for the Wednesday market and added two fairs, one at Corpus Christi and the other on the Thursday before St Andrew. Of the fairs only Corpus Christi remains; markets are now held on Tuesday, Thursday and Saturday. Apart from fishing and shipping, Penzance has never been an industrial centre.

PEONAGE (Span. *peon*; M. Lat. *pedo* (*pes*), primarily a foot-soldier, then a day-labourer), a system of agricultural servitude common in Spanish America, particularly in Mexico. In the early days the Spanish government, with the idea of protecting the Indians, exempted them from compulsory military service, the payment of tithes and other taxes, and regulated the system of labour; but left them practically at the mercy of the Spanish governors. The peons, as the Indian labourers were called, were of two kinds: (1) the agricultural workman who was free to contract himself, and (2) the criminal labourers who, often for slight offences, or more usually for debt, were condemned to practical slavery. Though legally peonage is abolished, the unfortunate peon is often lured into debt by his employer and then kept a slave, the law permitting his forcible detention till he has paid his debt to his master.

a "day of holy convocation" on which no servile work was to be done. It was called a "fiftieth-day feast." Pentecost or "Fiftieth" day is only a Greek equivalent of the last name (πεντηκοστή) in the Apocrypha and New Testament. The orthodox later Jews reckoned the fifty days from the 16th of Nisan, but on this there has been considerable controversy among Jews themselves. The orthodox later Jews assumed that the Sabbath in Lev. xxiii. 11, 15 is the 15th Nisan, or the first day of the feast of Maṣṣōth. Hitzig maintained that in the Hebrew calendar 14th and 21st Nisan were always Sabbaths, and that 1st Nisan was always a Sunday, which was the opening day of the year. "The morrow after the Sabbath" means, according to Hitzig, the day after the weekly Sabbath, viz. 22nd Nisan. Knobel (*Comment. on Leviticus*) and Kurtz agree with Hitzig's premises but differ from his identification of the Sabbath. They identify it with the 14th Nisan. Accordingly the "day after" falls on the 15th. (See Purves's article, "Pentecost," in Hastings's *Dict. of the Bible*, and also Ginsburg's article in Kitto's *Cyclopaedia*). Like the other great feasts, it came to be celebrated by fixed special sacrifices. The amount of these is differently expressed in the earlier and later priestly law (Lev. xxiii. 18 seq.; Num. xxviii. 26 seq.); the discrepancy was met by adding the two lists. The later Jews also extended the one day of the feast to two. Further, in accordance with the tendency to substitute historical for economic explanations of the great feasts, Pentecost came to be regarded as the feast commemorative of the Sinaitic legislation.

To the Christian Church Pentecost acquired a new significance through the outpouring of the Spirit (Acts ii.). (See WHITSUNDAY.)

It is not easy to find definite parallels to this festival in other ancient religious cults. The Akitu festival to Marduk was a spring festival at the beginning of the Babylonian year (Nisan). It therefore comes near in time to the feast of unleavened cakes rather than to the later harvest festival in the month Sivan called "feast of weeks." Zimmern indeed connects the Akitu festival with that of Purim on the 15th Adar (March); see *K.A.T.*[3] p. 514 seq. Also the Roman Cerealia of April 12th–19th rather correspond to *Maṣṣōth* than to *Ḳāṣīr*. (O. C. W.)

PENTELICUS (Βριλησσός, or Πεντελικὸν ὄρος from the deme Πεντέλη; mod. Mendeli), a mountain to the N.E. of the Athenian plain, height 3640 ft. Its quarries of white marble were not regularly worked until after the Persian wars; of this material all the chief buildings of Athens were constructed, as well as the sculpture with which they were ornamented. The ancient quarries are mostly on the south side of the mountain. The best modern quarries are on the north side. The top of Pentelicus commands a view over the plain of Marathon, and from it the Athenian traitors gave the signal to the Persians by a flashing shield on the day of the battle. There was a statue of Athena on the mountain.

PENTHEUS, in Greek legend, successor of Cadmus as king of Thebes. When Dionysus, with his band of frenzied women (Maenads) arrived at Thebes (his native place and the first city visited by him in Greece), Pentheus denied his divinity and violently opposed the introduction of his rites. His mother Agâvê having joined the revellers on Mount Cithaeron, Pentheus followed and climbed a lofty pine to watch the proceedings. Being discovered he was torn to pieces by Agave and others, who mistook him for some wild beast. His head was carried back to Thebes in triumph by his mother. Labdacus and Lycurgus, who offered a similar resistance, met with a like fearful end. Some identify Pentheus with Dionysus himself in his character as the god of the vine, torn to pieces by the violence of winter. The fate of Pentheus was the subject of lost tragedies by Thespis and Pacuvius.

See Euripides, *Bacchae*, *passim*; Ovid, *Metam.* iii. 511; Theocritus xxvi.; Apollodorus iii. 5, 2; Nonnus, *Dionysiaca*, xliv.–xlvi.; on representations in art see O. Jahn, *Pentheus und die Mainaden* (1841).

PENTHIÈVRE, COUNTS OF. In the 11th and 12th centuries the countship of Penthièvre in Brittany (dep. of Côtes-du-Nord) belonged to a branch of the sovereign house of Brittany. Hem d'Avaugour, heir of this dynasty, was dispossessed of the coun ship in 1235 by the duke of Brittany, Pierre Mauclerc, who gav it as dowry to his daughter, Yolande, on her marriage in 12; to Hugh of Lusignan, count of La Marche. Duke John of Brittany, Yolande's brother, seized the countship on hi death in 1272. In 1337 Joan of Brittany brought Penthièvi to her husband, Charles de Châtillon-Blois. In 1437 Nicole c Blois, a descendant of this family, married Jean de Brosse, an was deprived of Penthièvre by the duke of Brittany, Francis II in 1465. The countship, which was restored to Sebastian c Luxemburg, heir of the Brosses through his mother, was erecte for him into a duchy in the peerage of France (*duché-pairi* in 1569, and was afterwards held by the duchess of Mercœu daughter of the first duke of Penthièvre, and then by her daughte the duchess of Vendôme. The duchess of Vendôme's grandsor Louis Joseph, inherited Penthièvre in 1669, but it was take from him by decree in 1687 and adjudged to Anne Marie d Bourbon, princess of Conti. In 1696 it was sold to the coun of Toulouse, whose son bore the title of duke of Penthièvre This title passed by inheritance to the house of Orleans.

PENTHOUSE, a sloping roof attached to a building eithe to serve as a porch or a covering for an arcade, or, if supporte by walls, as a shed, a "lean-to." In the history of siegecraft the word is particularly applied to the fixed or movable construc tions used to protect the besiegers when mining, working batter ing-rams, catapults, &c., and is thus used to translate Lat *vinea* and *pluteus*, and also *testudo*, the shelter of locked shield of the Romans. The Mid. Eng. form of the word is *pentis*, a adaptation of O. Fr. *apentis*, Med. Lat. *appenditium* or *appen dicium*, a small structure attached to, or dependent on, anothe building, from *appendere*, to hang on to. The form "pent house" is due to a supposed connexion with "house" and Fr *pente*, sloping roof. The more correct form "pentice" is nov frequently used.

PENTSTEMON, in botany, a genus of plants (nat. orde Scrophulariaceae), chiefly natives of North America, witl showy open-tubular flowers. The pentstemon of the florist has, however, sprung from *P. Hartwegii* and *P. Cobaea*, anc possibly some others. The plants endure English winter unharmed in favoured situations. They are freely multiplied by cuttings, selected from the young side shoots, planted early in September, and kept in a close cold frame till rooted. They winter safely in cold frames, protected by mats or litter during frost. They produce seed freely, new kinds being obtained by that means. When special varieties are not required true from cuttings, the simplest way to raise pentstemons is to sow seed in heat (65° F.) early in February, afterwards pricking the seedlings out and hardening them off, so as to be ready for the open air by the end of May. Plants formerly known under the name of Chelone (*e.g. C. barbata, C. campanulata*) are now classed with the pentstemons.

PENUMBRA (Lat. *paene*, almost, *umbra*, a shadow), in astronomy, the partial shadow of a heavenly body as cast by the sun. It is defined by the region in which the light of the sun is partially but not wholly cut off through the interception of a dark body. (See ECLIPSE.)

PENZA, a government of eastern Russia, bounded N. by the government of Nizhniy-Novgorod, E. by Simbirsk, and S. and W. by Saratov and Tambov; area, 14,992 sq. m.; pop. (est. 1906), 1,699,000. The surface is undulating, with deep valleys and ravines, but does not exceed 900 ft. above sea-level. It is principally made up of Cretaceous sandstones, sands, marls and chalk, covered in the east by Eocene deposits. Chalk, potter's clay, peat and iron are the chief mineral products in the north. The soil is a black earth, more or less mixed with clay and sand; marshes occur in the Krasnoslobodsk district; and expanses of sand in the river valleys. There are extensive forests in the north, but the south exhibits the characteristic features of a steppeland. The government is drained by the Moksha, the Sura (both navigable) and the Khoper, belonging to the Oka, Volga and Don systems. Timber is floated down

1821), but his raw levies were repulsed. The army was gradually disbanded, and Pepe spent several years in England, France and other countries, publishing a number of books and pamphlets of a political character and keeping up his connexion with the Carbonari. When in 1848 revolution and war broke out all over Italy, Pepe returned to Naples, where a constitution had again been proclaimed. He was given command of the Neapolitan army which was to co-operate with Piedmont against the Austrians, but when he reached Bologna the king, who had already changed his mind, recalled him and his troops. Pepe, after hesitating between his desire to fight for Italy and his oath to the king, resigned his commission in the Neapolitan service and crossed the Po with 2000 volunteers to take part in the campaign. After a good deal of fighting in Venetia, he joined Manin in Venice and took command of the defending army. When the city was forced by hunger to surrender to the Austrians, Pepe and Manin were among those excluded from the amnesty; he again went into exile and died in Turin in 1855.

The story of Pepe's life down to 1846 is told in his own interesting *Memorie* (Lugano, 1847), and his *Narrative of the Events . . . at Naples in 1820 and 1821* (London, 1821); for the later period of his life see the general histories of the Risorgimento, and the biographical sketch in vol. ii. of L. Carpi's *Risorgimento* (Milan, 1886).

PEPERINO, an Italian name applied to a brown or grey volcanic tuff, containing fragments of basalt and limestone, with disseminated crystals of augite, mica, magnetite, leucite, &c. The typical peperino occurs in the Alban Hills, near Rome, and was used by the ancients, under the name of lapis albanus, as a building stone and for the basins of fountains. Other tuffs and conglomerates in Auvergne and elsewhere are also called peperino. The name originally referred to the dark-coloured inclusions, suggestive of pepper-corns. In English the word has sometimes been written peperine.

PEPPER, WILLIAM (1843–1898), American physician, was born in Philadelphia on the 21st of August 1843. He was educated at the university of Pennsylvania, graduating from the academic department in 1862 and from the medical department in 1864. In 1868 he became lecturer on morbid anatomy in the same institution, and in 1870 lecturer on clinical medicine. From 1876 to 1887 he was professor of clinical medicine, and in 1887 succeeded Dr Alfred Stillé as professor of theory and practice of medicine. He was elected provost of the university in 1881, resigning that position in 1894. For his services as medical director of the Centennial Exposition in 1876 he was made knight commander of St Olaf by the king of Sweden. He founded the *Philadelphia Medical Times*, and was editor of that journal in 1870–1871. He was known particularly for his contributions on the subject of the theory and practice of medicine, and the *System of Medicine*, which he edited in 1885–1886, became one of the standard textbooks in America. Among his contributions to the medical and scientific journals of the day were "Trephining in Cerebral Disease" (1871); "Local Treatment in Pulmonary Cavities" (1874); "Catarrhal Irrigation" (1881); "Epilepsy" (1883); and "Higher Medical Education: the True Interest of the Public and the Profession." He died on the 28th of July 1898 at Pleasanton, California.

PEPPER, a name applied to several pungent spices known respectively as black, white, long, red or cayenne, Ashanti, Jamaica, and melegueta pepper, but derived from at least three different natural orders of plants.

Black pepper is the dried fruit of *piper nigrum*, a perennial climbing shrub indigenous to the forests of Travancore and Malabar, from whence it has been introduced into Java, Sumatra, Borneo, the Malay Peninsula, Siam, the Philippines, and the West Indies. It climbs on tree-trunks by roots in the same way as ivy, and from its climbing habit is known as the pepper vine. It is one of the earliest spices known to mankind, and for many ages formed a staple article of commerce between India and Europe. Tribute has been levied in pepper; one of the articles demanded in 408 by Alaric as part of the ransom of Rome was 3000 ℔ of pepper. Its exorbitant price during the middle ages was one of the inducements which led the Portuguese to seek a sea-route to India. The discovery of the passage round the Cape of Good Hope led (1498) to a considerable fall in the price, and about the same time the cultivation of the plant was extended to the western islands of the Malay Archipelago. Pepper, however, remained a monopoly of the Portuguese crown as late as the 18th century. In Great Britain it was formerly taxed very heavily, the impost in 1623 amounting to 5s., and as late as 1823 to 2s. 6d. per ℔.

The largest quantities of pepper are produced in Penang, the island of Riouw, and Johore near Singapore—Penang affording on an average about half of the entire crop. Singapore is the great emporium for this spice in the East, the largest proportion being shipped thence to Great Britain. The varieties of black pepper met with in commerce are known as Malabar, Aleppy or Tellicherry, Cochin, Penang, Singapore and Siam.

Piper nigrum.

a, Twig with fruit (about ½ nat. size); *b*, longitudinal section of flower much enlarged; *c*, section of fruit.

It owes its pungency to a resin, and its flavour to a volatile oil, of which it yields from 1·6 to 2·2 %. The oil agrees with oil of turpentine in composition as well as in specific gravity and boiling point. In polarized light it deviates the ray, in a column 50 mm. long, 1·2° to 3·4° to the left. Pepper also contains a yellow crystalline alkaloid, called piperine, to the extent of 2 to 8 %. This substance has the same empirical formula as morphine, $C_{17}H_{19}NO_3$, but differs in constitution and properties. It is insoluble in water when pure, is devoid of colour, flavour and odour, and may be resolved into piperic acid, $C_{12}H_{10}O_4$, and piperidine, $C_5H_{11}N$. The latter is a liquid colourless alkaloid, boiling at 106° C., has an odour of pepper and ammonia, and yields crystallizable salts. A fatty oil is found in the pericarp of pepper, and the berries yield on incineration from 4·1 to 5·7 of ash. The only use of black pepper is as a condiment, but it may be given therapeutically in doses of 5 to 20 grains. It has the pharmacological actions of a volatile oil.

In the south-west of India, where the pepper-plant grows wild, it is found in rich, moist, leafy soil, in narrow valleys, propagating itself by running along the ground and giving off roots into the soil. The only method of cultivation adopted by the natives is to tie up the end of the vines to the neighbouring trees at distances of at least 6 ft., especially to those having a rough bark, in order that the roots may easily attach themselves to the surface. The underwood is then cleared away, leaving only sufficient trees to provide shade and permit free ventilation. The roots are manured with a heap of leaves, and the shoots are trained twice a year. In localities where the pepper does not grow wild, ground is selected which permits of free drainage, but which is not too dry nor liable to inundation, and cuttings are planted at about a foot from the trees either in the rainy season in June or in the dry season in February. Sometimes several cuttings about 18 in. long are placed in a basket and buried at the root of the tree, the cuttings being made to slope towards the trunk. In October or November the young plants are manured with a mixture of leaves and cow-dung. On dry soils the young plants require watering every other day during the dry season for the first three years. The plants bear in the fourth or fifth year, and if raised from cuttings are

fruitful for seven years, if from seed for fourteen years. The pepper from plants raised from cuttings is said to be superior in quantity and quality, and this method is in consequence most frequently adopted. Where there are no trees the ground is made into terraces and enclosed by a mud wall, and branches of *Erythrina indica* are put into the ground in the rainy season and in the course of a year are capable of supporting the young pepper plants. In the meantime mango trees are planted, these being preferred as supports, since their fruit is not injured by the pepper plant, while the *Erythrina* is killed by it in fourteen or fifteen years.

In Sumatra the ground is cleared, ploughed, and sown with rice, and cuttings of the vine are planted in September, 5 ft. apart each way, together with a sapling of quick growth and rough bark. The plants are now left for twelve or eighteen months and then entirely buried, except a small piece of bent stem, whence new shoots arise, three or four of which are allowed to climb the tree near which they are planted. These shoots generally yield flowers and fruits the next year. Two crops are collected every year, the principal one being in December and January and the other in July and August, the latter yielding pepper of inferior quality and in less quantity.

Two or three varieties are met with in cultivation; that yielding the best kinds has broadly ovate leaves, five to seven in number, nerved and stalked. The flower-spikes are opposite the leaves, stalked and from 3 to 6 in. long; the fruits are sessile and fleshy. A single stem will bear from twenty to thirty of these spikes. The harvest begins as soon as one or two berries at the base of the spikes begin to turn red, and before the fruit is mature, but when full-grown and still hard; if allowed to ripen, the berries lose pungency, and ultimately fall off and are lost. The spikes are collected in bags or baskets and dried in the sun. When dry the pepper is put into bags containing from 64 to 128 lb. In Sumatra the yield is estimated at about 1½ lb per plant per annum. In Malabar each vine gives 2 lb a year up to the fifteenth or twentieth year, or about 24 lb from each tree, a single tree sometimes supporting eight or twelve vines; an acre is calculated to bear 2500 plants, to cost about £4 in outlay to bring it into bearing, and to yield a produce of £80 when in its best condition.

White pepper differs only in being prepared from the ripe fruits. These, after collection, are kept in the house three days and then bruised and washed in a basket with the hand until the stalks and pulpy matter are removed, after which the seeds are dried. It is, however, sometimes prepared from the dried black pepper by removing the dark outer layer. It is less pungent than the black but possesses a finer flavour. It is chiefly prepared at the island of Riouw, but the finest comes from Tellicherry.

White pepper affords on an average not more than 1·9 % of essential oil; but, according to Cazeneuve, as much as 9 % of piperine, and of ash not more than 1·1 %.

Long pepper is the fruit-spike of *Piper officinarum* and *P. longum*, gathered shortly before it reaches maturity and dried. The former is a native of the Indian Archipelago, and has oblong-ovate, acuminate leaves, which are pinnately veined. The latter is indigenous in the hotter provinces of India, Ceylon, Malacca and the Malay Islands; it is distinguished from *P. officinarum* by the leaves being cordate at the base and five-veined.

Long pepper appears to have been known to the ancient Greeks and Romans under the name of πέπερι μακρόν; and in the 10th century mention is made of long pepper, or macropiper, in conjunction with black and white peppers. The spice consists of a dense spike of minute baccate fruits closely packed around the central axis, the spike being about 1½ in. long and ¼ in. thick; as met with in commerce they have the appearance of having been limed. In Bengal the plants are cultivated by suckers, which are planted about 5 ft. apart on dry rich soil on high ground. An English acre will yield about 3 maunds (80 lb) the first year, 12 the second, and 18 the third year; after this time the yield decreases, and the roots are therefore grubbed up and sold as *pipli mul*, under which name they are much used as a medicine in India. After the fruit is collected, which is usually in January, the stem and leaves die down to the ground. Long pepper contains piperine, resin and volatile oil and yields about 8 % of ash. Penang and Singapore are the principal centres in the East for its sale.

Ashanti or *West African pepper* is the dried fruit of *Piper Clusii*, a plant widely distributed in tropical Africa, occurring most abundantly in the country of the Niam-niam. It differs from black pepper in being rather smaller, less wrinkled, and in being attenuated into a stalk, like cubebs (the dried unripe fruits of *P. Cubeba*), to which it bears considerable resemblance externally. The taste, however, is pungent, exactly like that of pepper, and the fruit contains piperine. It was imported from the Grain Coast by the merchants of Rouen and Dieppe as early as 1364, and was exported from Benin by the Portuguese in 1485; but, according to Clusius, its importation was forbidden by the king of Portugal for fear it should depreciate the value of the pepper from India. In tropical Africa it is extensively used as a condiment, and it could easily be collected in large quantities if a demand for it should arise.

Jamaica pepper is the fruit of *Pimenta officinalis*, an evergreen tree of the Myrtle family. It is more correctly termed "pimento" or "allspice," as it is not a true pepper.

Melegueta pepper, known also as "Guinea grains," "grains of paradise" (*q.v.*) or "alligator pepper," is the seed of *Amomum Melegueta*, a plant of the ginger family; the seeds are exceedingly pungent, and are used as a spice throughout central and northern Africa.

For *Cayenne pepper*, see that article.

PEPPER-CORN, the fruit or seed of the pepper plant; hence anything very small or insignificant. *Pepper-corn rent* is a merely nominal rent, reserved for the purpose of having the tenancy acknowledged by the tenant. Building leases frequently reserve a pepper-corn as rent for the first few years. (See RENT.)

PEPPERMINT, an indigenous perennial herb of the natural order Labiatae, and genus *Mentha* (see MINT), the specific name being *Mentha piperita*, is distinguished from other species of the genus by its stalked leaves and oblong-obtuse spike-like heads of flowers. It is met with, near streams and in wet places, in several parts of England and on the European continent, and is also extensively cultivated for the sake of its essential oil in England[1] in several parts of continental Europe, and in the

FIG. 1.—*Mentha piperita.*

United States. Yet it was only recognized as a distinct species late in the 17th century, when Dr Eales discovered it in Hertfordshire and pointed it out to Ray, who published it in the second edition of his *Synopsis stirpium britannicarum* (1696). The medicinal properties of the plant were speedily recognized and it was admitted into the *London Pharmacopoeia* in 1721, under the name of *Mentha piperitis sapore.*

Two varieties are recognized by growers, the white and the black mint. The former has purplish and the latter green stems; the leaves are more coarsely serrated in the white. The black is more generally cultivated, probably because it is found to yield more oil, but that of the white variety is considered to have a more delicate odour, and obtains a higher price. The white is the kind chiefly dried for herbalists. The flavour varies to a slight extent even with particular plots of land, badly drained ground being known to give unfavourable results both as to the quantity and quality of the oil. That of the Japanese

[1] Near Mitcham in Surrey, Wisbech in Cambridgeshire, Market Deeping in Lincolnshire and Hitchin in Hertfordshire.

and Chinese oil also differs slightly from the English, and is thus distinguishable by experts. In America the oil is liable to be injured in flavour by aromatic weeds which grow freely among the crop, the most troublesome of these being *Erigeron canadense*, and *Erechthites hieracifolia*. When pure the oil is nearly colourless and has an agreeable odour and powerful aromatic taste, followed by a sensation of cold when air is drawn into the mouth. It has a specific gravity of 0·84 to 0·92, and boils at 365° F. Mitcham oil, when examined by polarized light in a column 50 mm. long, deviates from 14·2° to 10·7° to the left, the American 4·3°. When oil of peppermint is cooled to 4° C. it sometimes deposits colourless hexagonal prisms of menthol, $C_{10}H_{20}O$, which are soluble in alcohol and ether, almost insoluble in water, and fusible at 92° F. The oil consists chiefly of menthol and a terpene called menthene, $C_{10}H_{18}$. Oil of peppermint is often adulterated with a third part of rectified spirit, which may be detected by the milkiness produced when the oil is agitated with water. Oil of rosemary and rectified oil of turpentine are sometimes used for the same purpose. If the oil contains turpentine it will explode with iodine. If quite pure it dissolves in its own weight of rectified spirits of wine. Peppermint oil is largely distilled at Canton, a considerable quantity being sent to Bombay, also a large quantity of menthol. The species cultivated in the neighbourhood of Canton is *Mentha arvensis*, var. *glabrata*. Peppermint is chiefly cultivated in the province of Kiang-si; and according to native statements as much as 40 piculs of oil of peppermint are sent annually to ports on the coast. In Japan also the distillation of oil of peppermint forms a considerable industry, the plant cultivated being *M. arvensis*, var. *piperascens*. The oil, under the name of *hakka no abura*, is exported from Hiogo and Ozaka, but is said to be frequently adulterated. The menthol is obtained by subjecting the oil to a low temperature, when it crystallizes out and is separated. The two varieties of *M. arvensis* just named yield much more menthol than *M. piperita*. It is remarkable, however, that the *M. arvensis*, var. *javanica*, growing in Ceylon, has not the flavour of peppermint but that of garden mint, while the typical form of *M. arvensis* grown in Great Britain has an odour so different from peppermint that it has to be carefully removed from the field lest it should spoil the flavour of the peppermint oil when the herb is distilled. *M. incana*, cultivated near Bombay as a herb, also possesses the flavour of peppermint. In the form in which menthol is imported it bears some resemblance to Epsom salts, with which it is sometimes adulterated.

FIG. 2.—*Mentha arvensis*, var. *piperascens*.
a, Flowering branch (reduced). *b*, calyx showing form of teeth (enlarged).

The volatile oil of *Mentha piperita* is a valuable and widely used drug. Its chief constituents are menthol and menthene, which is a liquid terpene. The British pharmacopoeia contains two preparations of this oil, the *Aqua menthae piperitae* and the *Spiritus menthae piperitae*. The oil has the characters of its class, with certain special features. Its local anaesthetic action is exceptionally strong. It is also powerfully antiseptic. These two properties make it valuable in the relief of toothache and in the treatment of carious cavities in the teeth. They also render the drug valuable in certain forms of dyspepsia and in colic generally, "soda-mint lozenges" being a familiar form. The characteristic anti-spasmodic action of the volatile oils is perhaps more marked in this than in any other oil, and greatly adds to its power of relieving pains arising in the alimentary canal. The volatile oil of spearmint is also official in Great Britain and the United States, being given in the same doses and for the same purposes as oil of peppermint. It is of less value medicinally, not containing any appreciable quantity of menthol, the place of which is taken in the *oleum menthae viridis*—the pharmacopoeial name—by carvone, $C_{10}H_{14}O$, found in caraway oil, and isomeric with thymol.

The following mode of cultivation of peppermint is adopted at Market Deeping. A rich triable soil, retentive of moisture, is selected, and the ground is well tilled 8 to 10 in. deep. The plants are propagated in the spring, usually in April and May. When the young shoots from the crop of the previous year have attained a height of about 4 in. they are pulled up and transplanted into new soil. They grow vigorously the first year, and throw out numerous stolons on the surface of the ground. After the crop has been removed these are allowed to harden or become woody, and then farm-yard manure is scattered over the field and ploughed in. In this way the stolons are divided into numerous pieces, and covered with soil before the frost sets in. If the autumn is wet they are liable to become sodden, and rot, and the next crop fails. In the spring the fields are dressed with Peruvian guano. In new ground the peppermint requires hand-weeding two or three times, as the hoe cannot be used without injury to the plants. Moist heavy weather in August is apt to cause the foliage to drop off and leave the stems almost bare. In these circumstances rust (*Puccinia menthae*) also is liable to attack the plants. This is prevented to a certain extent by a rope being drawn across the plants, by two men walking in the furrows, so as to remove excessive moisture. The average yield of peppermint is about 165 cwt. per acre. The first year's crop is always cut with the sickle to prevent injury to the stolons. The herb of the second and third year is cut with scythes, and then raked by women into loose heaps ready for carting. The field is then gleaned by boys, who add what they collect to the heaps. The plants rarely yield a fourth crop on the same land. The harvest usually commences in the beginning or middle of August, or as soon as the plants begin to flower, and lasts for six weeks, the stills being kept going night and day. The herb is carted direct from the field to the stills, which are made of copper, and contain about 5 cwt. of the herb. Before putting the peppermint into the still water is poured in to a depth of about 2 ft., at which height a false bottom is placed, and on this the herb is thrown and trodden down by men. The lid, which fits into a water-joint, is then let down by pulleys and fastened by two bars, any excess of pressure or temperature being indicated by the water that is ejected at the joint. The distillation is conducted by the application of direct heat at the lowest possible temperature, and is continued for about four and a half hours. When this operation is completed, the lid is removed and a rope is attached to a hook on the false bottom, which, as well as the herb resting on it, is raised bodily by a windlass and the peppermint carried away in the empty carts on their return journey to the fields, where it is placed in heaps and allowed to rot, being subsequently mixed with the manure applied in the autumn as above stated. The usual yield of oil, if the season be warm and dry, is said to be 1 oz. from 5 lb of the fresh flowering herb, but, if wet and unfavourable, the product is barely half that quantity. The yield of a charge of the still is estimated at from 1 lb 12 oz. to 5 lb. The oil improves in mellowness even if kept as long as ten or fourteen years. The green colour sometimes present in the oil is stated to be due to a quantity of water larger than necessary having been used in the distillation; on the other hand, if the herb be left in the still from Saturday to Monday, the oil assumes a brown tint.

In France peppermint is cultivated on damp rich ground at Sens, in the department of the Yonne. In Germany it is grown in the neighbourhood of Leipzig, where the little town of Cölleda produces annually as much as 40,000 cwt. of the herb. In the United States peppermint is cultivated on a most extensive scale, chiefly in south-west Michigan, the west districts of New York state, and Ohio. The yield averages from 10 to 30 lb per acre. In Michigan the plant was introduced in 1855.

PEPPERRELL, SIR WILLIAM (1696–1759), American soldier, was born in Kittery, Maine, then a part of Massachusetts, on the 27th of June 1696. He studied surveying and navigation, and joined his father in his ship-building, fishing and general trading business, quickly becoming one of the wealthiest and most influential men in the province. He was commissioned captain (1717), major, lieutenant-colonel, and in 1726 colonel of militia. Pepperrell served in the Massachusetts general court (1726–1727), and in the governor's council (1727–1759), of which for eighteen years he was president. Although not a trained lawyer, he was chief justice of the court of common pleas from 1730 until his death. In 1745 he was commander-in-chief of the New England force of about 4000, which, with the assistance of a British squadron under Commodore Peter Warren, besieged and captured the French fortress of Louisburg, the garrison surrendering on the 16th of June and Pepperrell and Warren taking possession on the following day. For his services Pepperrell, in November 1746, was created a baronet—the only New Englander so honoured. He was active in raising troops

during the "French and Indian War," and received the rank of lieutenant-general in February 1759. He died in Kittery, Maine, on the 6th of July in the same year.

See Usher Parsons, *Life of Sir William Pepperrell, Bart.* (Cambridge, Mass., 1855), based on the family papers.

PEPPER TREE, a tree which has no proper connexion with the true pepper (*Piper*), and is really a member of the natural order Anacardiaceae, being known botanically as *Schinus Molle*, from the Peruvian name *Mulli*. It is a native of tropical South America and is grown in the open air in the south of Europe. It is a small tree with unequally pinnate leaves, the segments linear, entire or finely saw-toothed, the terminal one longer than the rest, and all filled with volatile oil stored in large cells or cysts, which are visible to the naked eye and appear like holes when the leaf is held up to the light. When the leaves are thrown upon the surface of water the resinous or oily fluid escapes with such force as violently to agitate them. The flowers are small, whitish, arranged in terminal clusters and polygamous or unisexual, with five sepals, as many petals, ten stamens (as large as the petals in the case of the male flower, very small in the female flower, but in both springing from a cushion-like disk surrounding the base of the three-celled ovary). The style is simple or three-cleft, and the fruit a small, globose, pea-like drupe with a bony kernel enclosing a single seed. The fleshy portion of the fruit has a hot aromatic flavour from the abundance of the resin it contains. The resin is used for medicinal purposes by the Peruvians, and has similar properties to mastic. The Japan pepper tree is *Xanthoxylum piperitum* the fruits of which have also a hot taste. Along the Riviera the tree known as *Melia Azedarach*, or the "Pride of India," is also incorrectly called the pepper tree by visitors.

PEPSIN, an enzyme or ferment obtained by drying the mucous lining of the fresh and healthy stomach of a pig, sheep or calf. As used in medicine it consists of a light yellow-brown or white powder or of pale yellow translucent grains or scales. It is only slightly soluble in water and alcohol. Pepsin is used to help gastric digestion in old people and in those in whom there is a deficient secretion of the gastric juice. It is useful in chronic catarrhal conditions of the stomach, the dyspepsia of alcoholism, and in gastric ulcer and cancer of the stomach.

Pepsin digests the albumens but is useless in the digestion of fats or carbohydrates. It may also be used to predigest albuminous foods. The following is a method of peptonizing beef. Take ½ lb of minced raw lean beef, ½ pint of water containing 0·2 % of hydrochloric acid, place in a jar with 30 grs. of pepsin, set in a warm place at 110° F. for 3 hours, stirring occasionally. Then quickly boil it. It is usually unnecessary to strain it, as the meat is reduced to a fine almost impalpable powder which is readily assimilated. Many varieties of proprietary peptonizing tablets are on the market and are convenient for the preparation of peptonized milk. The following is a method of preparing it. Take a clean glass quart bottle, pour in a pint of perfectly fresh cold milk, then add a teacupful of cold water in which a peptonizing tablet has been dissolved. Submerge the bottle in a can of water at 100° F. for from 5 to 10 minutes, take out the bottle and place on ice to prevent the further action of the pepsin. If no ice is convenient bring the milk to a boil for the same purpose. If the action of the pepsin be continued for a much longer period the milk becomes bitter to the taste from the development of excess of peptones. Predigested foods should not be used over a long period or the digestive functions of the stomach may atrophy from disuse.

Pancreatic solution, derived from the pancreas of a pig digested in alcohol, has the power of converting starch into sugar, and albumen and fibrin into peptones. It only acts in an alkaline medium and at a temperature under 140° F. If used to peptonize milk sodium bicarbonate should be added. Many commercial preparations are on the market. Trypsin, the principal ferment of the pancreas, also changes proteids into peptones.

PEPUSCH, JOHN CHRISTOPHER (1667–1752), English musician, of German parentage, was born in Berlin. He began his study of music at an early age, and about 1700 left Berlin and went to England, where he had various engagements, and where he went on with his researches into ancient music. He composed a number of church services and instrumental pieces, besides music for masques and plays, but he is best known in connexion with the founding in 1710 of the Academy of Ancient Music. In 1713 he was made a Mus.D. of Oxford, and in 1746 F.R.S. In 1718 he married Margarita de l'Épine (d. 1746), wh[o] as the first Italian to sing in England, was described in 1692 i[n] the *London Gazette* simply as "the Italian woman." Pepusc[h] died in London on the 20th of July 1752. His *Treatise o[n] Harmony* (anonymous 1st ed. 1730) is believed to have been a[n] embodiment of his rules drafted by his pupil Viscount Paisley[,] afterwards earl of Abercorn.

PEPYS, SAMUEL (1633–1703), English diarist, was born o[n] the 23rd of February 1633. The place of his birth is not know[n]. The name was pronounced in the 17th century, and has alway[s] been pronounced by the family, "Peeps." The family can b[e] traced in Cambridgeshire as far back as the reign of Edward I. They rose by slow degrees from the class of small copyholder[s] and yeoman farmers to the position of gentry. In 1563 they ha[d] a recognized right to use a coat of arms. John Pepys, Samuel'[s] father, was a younger son, who, like other gentlemen in hi[s] position in that age, went into trade. He was for a time estab[-]lished as a tailor in London, but in 1661 he inherited a sma[ll] estate at Brampton near Huntingdon, where he lived during th[e] last years of his life.

Samuel was fifth child and second son of a large family, a[ll] of whom he survived. His first school was in Huntingdon, bu[t] he was afterwards sent to St Paul's in London, where he remaine[d] till 1650. While at St Paul's he was an eyewitness of the execu[-]tion of King Charles I. On the 21st of June in that year hi[s] name was entered as a sizar on the books of Trinity Hal[l,] Cambridge, but it was transferred to Magdalene on the 1st o[f] October. On the 5th of March he entered into residence, an[d] he remained there till 1654 or 1655. He obtained a Spendluff[e] scholarship a month after entering, and one on Dr John Smith'[s] foundation on the 14th of October 1653. Nothing is known o[f] his university career except that on the 21st of October 1653 h[e] was publicly admonished with another undergraduate for havin[g] been "scandalously overserved with drink." At Cambridge h[e] wrote a romance, *Love is a Cheat*, which he afterwards destroye[d]. On the 1st of December 1655 he was married at St Margaret'[s] church, Westminster, to Elizabeth, daughter of Alexande[r] Marchant, Sieur de St Michel, a French Huguenot exile fro[m] Anjou who had married an English lady named Kingsmil[l]. Pepys had at this time no independent means, and probabl[y] relied on his cousins, the Montagues, to provide for him. On th[e] 26th of March 1658 he was cut for the stone, an event whic[h] he always kept in memory by a solemn anniversary. In 165[9] he went as secretary with his cousin, Edward Montagu, afte[r]wards earl of Sandwich, on a voyage to the Sound. On hi[s] return he was engaged as a clerk under Mr (afterwards Si[r]) Edward Downing, one of the four tellers of the exchequer. I[n] 1660 he accompanied his cousin, who commanded the fleet whic[h] brought King Charles II. back from exile. In that year, by th[e] interest of his cousin, he was named "clerk of the acts" in th[e] navy office, but was compelled to buy off a competitor, on[e] Barlow, by an annuity of £100.

Pepys was now fairly established in the official career which le[d] him to honour. On the 1st of January 1660 he had begun hi[s] second and hidden life as a diarist. It is in that capacity tha[t] he is of such unique interest. But if his diary had never bee[n] written, or had been lost, he would still be a notable man, as a[n] able official, the author of valuable *Memoirs of the Navy* (1690), an amateur musician and protector of musicians, a gentlema[n] who took an enlightened interest in science, and was electe[d] president of the Royal Society. To his contemporary diaris[t] John Evelyn, he appeared as "a worthy, industrious and curiou[s] person." It is true that Andrew Marvel accused him of havin[g] accumulated a fortune of £40,000 by "illegal wages." But thi[s] charge, made in a pamphlet called *A List of the Principa[l] Labourers in the great design of Popery and Arbitrary Powe[r]* was attributed to political animosity. To the world he appeare[d] as an honourable and religious man, and so he would seem to hav[e] been to us if he had not recorded in his diary all those weakness[es] of character and sins of the flesh which other men are mo[st] careful to conceal.

His place of clerk to the Navy Board was equivalent to th[e]

post of permanent under secretary in modern times. It made him chief of the secretariat and a member of the administrating body of the navy. Though he was so ignorant of business that he did not even know the multiplication table when he first took office, he soon mastered the needful mechanical details by working early and late. He had other posts and honours, which came to him either as consequential on his clerkship or because he was a useful official. On the 23rd of July 1660 he was appointed one of the clerks of the privy seal, an office which returned him £3 a day in fees. He was made a justice of the peace. In 1662 he was appointed a younger brother of the Trinity House, and was named a commissioner for managing the affairs of Tangier, then occupied by an English garrison. In 1664 he became a member of the corporation of the Royal Fishery, to which body he was named treasurer when another official had brought the accounts into confusion. In that year he also joined the Royal Society. During the naval war with Holland (1664–67) he proved himself an indefatigable worker. As surveyor of the victualling, the whole burden of a most important department was thrown on him in addition to his regular duties. He in fact organized the department. While the plague was raging in London in 1666 he remained at his post when many of his colleagues ran away, and he manfully avowed his readiness to take the risk of disease, as others of the king's servants faced the dangers of war. He had now gained the full confidence of the lord high admiral, the duke of York, afterwards King James II. When, on the termination of the war, the navy office was violently attacked in parliament, he was entrusted with its defence. The speech which he delivered at the bar of the House of Commons on the 5th of March 1668 passed for a complete vindication. In sober fact the charges of mismanagement were well founded, but the fault was not in the officials of the navy office only, and Pepys, who was master of the details, had no difficulty in throwing dust in the eyes of the House of Commons, which was ignorant. Nobody indeed was better acquainted with the defects of the office, for in 1668 he drew up for the duke of York two papers of inquiry and rebuke, "The Duke's Reflections on the severall Members of the Navy Board's Duty" and "The Duke's answer to their severall excuses" (Harleian MS. 6003). In 1669 he travelled abroad. His success in addressing parliament gave him the ambition to become a member of the House of Commons. He stood for Aldborough, but the death of his wife, on the 10th of November 1669, prevented him from conducting his canvass in person, and he was not elected. In 1673 he was returned for Castle Rising. The validity of his election was questioned by his opponent, Mr Offley, and the committee of privilege decided against him, but the prorogation of the house prevented further action. The no-popery agitation was now growing in strength. The duke of York was driven from office by the Test Act, and Pepys was accused of "popery," partly on the ground that he was said to keep a crucifix and altar in his house, partly because he was accused of having converted his wife to Roman Catholicism. The crucifix story broke down on examination, but there is some reason to believe that Mrs Pepys did become a Roman Catholic. Pepys was transferred by the king from the navy office to the secretaryship of the admiralty in 1673. In 1679 he was member for Harwich, and in the height of the popish plot mania he was accused, manifestly because he was a trusted servant of the duke of York, of betraying naval secrets to the French, but the charges were finally dropped. Pepys was released on bail on the 12th of February 1680. In that year he accompanied the king to Newmarket, and took down the narrative of his escape after the battle of Worcester. A proposal to make him head of King's College, Cambridge, in 1681, came to nothing. In 1682 he accompanied the duke of York to Scotland, where the uncleanly habits of the people caused him great offence. In 1683–1684 he was engaged in arranging for the evacuation of Tangier. He visited the place and kept a diary of his voyage. In 1684 he was elected president of the Royal Society. On the accession of King James II. in 1685 he retained his place as secretary to the admiralty, to which he had been appointed by patent when James resumed the lord high admiralship (June 10, 1684), and Pepys was in effect minister for the navy. The revolution of 1688 ended his official career. He was dismissed on the 9th of March 1689, and spent the rest of his life in retirement, and, except for a brief imprisonment on the charge of Jacobite intrigue in 1690, in peace. He died at his house in Clapham on the 25th of May 1703. His last years were passed in correspondence with his friends, who included Evelyn and Dryden, or in arranging his valuable library. It was left on his death to his nephew, John Jackson, son of his sister Pauline, and in 1724, by the terms of his will, was transferred to Magdalene College, Cambridge, where it is still preserved.

Such was the outward and visible life of Samuel Pepys, the public servant whose diligence was rewarded by success. The other Pepys, whom Sir Walter Scott called "that curious fellow," was revealed in 1825, when his secret diary was partly published. The first entry was made on the 1st of January 1660, the last on the 31st of May 1669, when the increasing weakness of his eyes, which had given him trouble since 1664, compelled him to cease writing in the conditions he imposed upon himself. If there is in all the literature of the world a book which can be called "unique" with strict propriety it is this. Confessions, diaries, journals, autobiographies abound, but such a revelation of a man's self has not yet been discovered. The diary is a thing apart by virtue of three qualities which are rarely found in perfection when separate and nowhere else in combination. It was secret; it was full; and it was honest. That Pepys meant it for his own eye alone is clear. He wrote it in Shelton's system of tachygraphy published in 1641, which he complicated by using foreign languages or by varieties of his own invention whenever he had to record the passages least fit to be seen by his servants or by "all the world." Relying on his cypher he put down whatever he saw, heard, felt or imagined, every motion of his mind, every action of his body. And he noted all this, not as he desired it to appear to others, but as it was to his seeing. The result is "a human document" of amazing vitality. The man who displays himself to himself in the diary is often odious, greedy, cowardly, casuistical, brutal. He tells how he kicked his cook, and blacked his wife's eye, and was annoyed when others saw what he had done. He notes how he compelled the wives of unfortunate men who came to draw their husband's pay at the navy office to prostitute themselves; how he took "compliments," that is to say gifts, from all who had business to do with the navy office; how he got tipsy and suffered from sick headache; how he repented, made vows of sobriety, and found casuistical excuses for breaking them. The style is as peculiar as the matter—colloquial, garrulous, racy from simplicity of language, and full of the unconscious humour which is never absent from a truthful account of the workings of nature in the average sensual man. His position enabled him to see much. His complete harmony with the animalism and vulgarity of the Restoration makes him a valuable witness for his time. To his credit must be put the facts that he knew the animalism and vulgarity to be what they were; that he had a real love of music and gave help to musicians, Cesare Morelli for instance; that though he made money out of his places he never allowed bad work to be done for the navy if he could help it; that he was a hard worker; and that he had a capacity for such acts of kindness and generosity as are compatible with a gross temperament and a pedestrian ambition.

The diary, written in a very small hand in six volumes, was included among his books at Magdalene. On the publication of Evelyn's diary in 1818, the then head of Magdalene, the Hon. and Rev. George Neville, decided to publish Pepys's. Part of the MS. was deciphered by his cousin Lord Grenville. The library contained both the short and the long-hand copies of Pepys's account of King Charles's adventures, but its books were so little known by the curators that this key was overlooked. The MS. was deciphered by John Smith, afterwards rector of Baldock in Hertfordshire, between 1819 and 1822. The first and partial edition, edited by Richard Neville Griffin, 3rd Lord Braybrooke, appeared in 1825 in two volumes quarto (London). It attracted great attention and was reviewed by Sir Walter Scott in the *Quarterly* for January 1826. A second edition in two octavo

volumes followed in 1828 (London). A third and enlarged edition in five volumes octavo appeared in 1848–1849, and a fourth in four in 1854 (London). In 1875–1879 Dr Minors Bright published a still fuller edition in six volumes octavo (London). Many portraits of Pepys are known to have been taken and several can be traced. One was taken by Savill (1661), another by John Hales (1666), now in the National Portrait Gallery. A portrait by Sir Peter Lely is in the Pepysian library, Magdalene College, Cambridge. Three portraits were taken by Sir Godfrey Kneller, of which one belongs to the Royal Society, and another is in the Hall of Magdalene. Pepys's only known publication in his life was the *Memoirs of the Navy*, but other writings have been attributed to him.

AUTHORITIES.—The standard edition of *Pepys's Diary* is that by H. B. Wheatley, in nine volumes octavo, with a supplementary volume of *Pepysiana* (London, 1893-1899). See also Wheatley's *Samuel Pepys, and the world he lived in* (London, 1880); *The Life, Journals and Correspondence of Pepys*, by J. Smith (London, 1841); E. H. Moorhouse, *Samuel Pepys, Administrator, Observer, Gossip* (1909); and P. Lubbock, *Samuel Pepys* (1909). (D. H.)

PEQUOT, an Algonquian tribe of North American Indians, a branch of the Mohicans. They occupied the coast of Connecticut from Niantic river to the Rhode Island boundary. Together with their kinsmen, the Mohegans, they formed a powerful and warlike people, bitterly hostile to the early settlers. In 1637 the Pequots were surprised by the whites at their fort on the Mystic river, and suffered so complete a defeat that the tribe was broken up, and its remnants took refuge with neighbouring tribes. The Pequot country passed under the control of the Mohegans. At the height of their power the Pequots numbered, it is estimated, some 3000.

PERCEPTION (from Lat. *percipere*, to perceive), in psychology, the term specially applied to the mental process by which the mind becomes conscious of an external object; it is the mental completion of a sensation, which would otherwise have nothing but a momentary existence coextensive with the duration of the stimulus, and is intermediate between sensation and the "ideal revival," which can reinstate a perceptual consciousness when the object is no longer present. This narrow and precise usage of the term "perception" is due to Thomas Reid, whose view has been generally adopted in principle by modern psychologists. On the other hand some psychologists decline to accept the view that the three processes are delimited by sharp lines of cleavage. It is held on the one hand that sensation is in fact impossible as a purely subjective state without cognition; on the other that sensation and perception differ only in degree, perception being the more complex. The former view admits, which the latter practically denies, the distinction in principle. Among those who adopt the second view are E. B. Titchener and William James. James (*Principles of Psychology*, ii. 76) compares sensation and perception as "the barer and the richer consciousness," and says that "beyond the first crude sensation all our consciousness is a matter of suggestion, and the various suggestions shade gradually into each other, being one and all products of the same psychological machinery of association" Similarly Wundt and Titchener incline to obliterate the distinction between perception and ideal revival. Prior to Reid, the word perception had a long history in the wider sense of cognition in general. Locke and Hume both use it in this sense, and regard thinking as that special kind of perception which implies deliberate attention. (See PSYCHOLOGY.)

PERCEVAL, or PERCYVELLE (Ger. *Parzival*, Fr. *Perlesvaus*, Welsh, *Peredur*), the hero of a comparatively small, but highly important, group of romances, forming part of the Arthurian cycle. Originally, the story of Perceval was of the character of a folk-tale, and that one of remarkable importance and world-wide diffusion. He is represented as the son of a widow, "la dame veuve," his father having been slain in tourney, battle or by treachery, either immediately before, or shortly after his birth. The mother, fearful lest her son should share his father's fate, flies to the woods, either alone with one attendant, or with a small body of faithful retainers, and there brings up her son in ignorance of his name, his parentage and all knightly accomplishments. The youth grows up strong, swift-footed and of great personal beauty, but, naturally enough, of very limited intelligence. This last is one of the most characteristic traits of the Perceval story, connecting it alike with the Irish *Lay of the Great Fool*, and the Teutonic *Dümmling* tales. He spends his days chasing the beasts of the forest, running them down by sheer speed, or killing them with darts (javelots) or bow and arrows, the only weapons he knows.

One day, however, he meets a party of knights in armour; he first adores the leader as God, and then takes them to be some new and wondrous kind of animal, asking the most naïve questions as to their armour and equipment. Being told that they are knights he determines that he too will be one, and returns to his mother announcing his intention of at once setting forth into the world to seek for knighthood. Dressed as a peasant (or a fool), he departs (his mother, in some versions, dying of grief), and comes to the king's court. Of course in the romance it is the court of Arthur; probably in the original tale it was simply "the king." Here his uncouth behaviour and great personal beauty attract general attention, and he is alike mocked by Kay, and his future distinction mysteriously foretold. He slays a foe of Arthur's, the Red Knight, who has insulted the king, and challenged the knights of the court, who, for some mysterious reason, are unable to respond to the challenge. Dressing himself in the armour of the slain knight, which he has great difficulty in handling and eventually puts on over his peasant's garb, he sets out on a series of adventures which differ greatly in the various versions, but the outcome of which is that he becomes a skilful and valiant knight and regains the heritage of his father.

This, the Perceval story proper, has been recognized by scholars as a variant of a widespread folk-tale theme, designated by J. C. von Hahn as the *Aryan Expulsion and Return* formula, which counts among its representatives such heroes as Perseus, Cyrus, Romulus and Remus, Siegfried, and, as Alfred Nutt has pointed out, Arthur himself. This particular variant appears to be of British-Celtic origin, and the most faithful representative of the original tale is now very generally held to be the English *Syr Percyvelle of Galles*, a poem preserved in the Thornton manuscript. Here the hero is nephew to Arthur on the mother's side, and his father, of the same name as himself, is a valiant knight of the court. A noticeable feature of the story is the uncertainty as to the hero's parentage; the mother is always a lady of rank, a queen in her own right, or sister of kings (as a rule of the Grail kings); but the father's rank varies, he is never a king, more often merely a valiant knight, and in no instance does he appear to be of equal rank with his wife. This distinguishes the story from that of Lancelot, with which some modern scholars have been inclined to identify it; for Lancelot's parentage is never in doubt, he is *fis du roi*.

The connexion of the story with Arthur and his court brought about a speedy and more important development, the precise steps of which are not yet clear: Perceval became the hero of the Grail quest, in this ousting Gawain, to whom the adventure originally belonged, and the Perceval became merged in the Grail tradition. Of the *Perceval-Grail* romances the oldest from the point of view of manuscript preservation is the *Perceval* or *Conte del Graal* of Chrétien de Troyes. Two manuscripts, indeed, the British Museum and Mons texts, preserve a fragment relating the birth and infancy of the hero, which appears to represent the source at the root alike of Chrétien and of the German *Parzival*, but it is only a fragment, and so far no more of the poem has been discovered. Chrétien left his poem unfinished, and we do not know how he intended to complete the adventures of his hero; but those writers who undertook the task, Wauchier de Denain, Gerbert de Montreuil and Manessier, carried it out with such variety of detail, and such a bewildering indifference to Chrétien's version, that it seems practically certain that there must have been, previous to Chrétien's work, more than one poem dealing with the same theme. The German poet, Wolfram von Eschenbach, whose *Parzival* in parts closely agrees with the *Perceval* and who was long held to be a mere translator of Chrétien,

differs widely in the setting of his story. He gives an introduction, in which the adventures of the father, here a prince of Anjou, are related; a conclusion, in which the Swan-Knight, Lohengrin, is made Parzival's son; he represents the inhabitants of the Grail castle as Templars (Templeisen); and makes the Grail itself a stone. Finally, he reproaches Chrétien with having told the story amiss, whereas Kiot, the Provençal, whose version Wolfram was following, had told it aright from beginning to end. It is certain that Gerbert knew, and used, a *Perceval* which, if not Kiot's poem, must have been closely akin to it; as he too makes the Swan-Knight a descendant of the Grail hero. The probability seems to be that the earliest Perceval-Grail romance was composed at Fescamp, and was coincident with the transformation, under the influence of the *Saint-Sang* legend, of the originally Pagan talisman known as the Grail into a Christian relic, and that this romance was more or less at the root of all subsequent versions.

Besides the poems, we have also two prose Perceval romances, the relative position of which has not yet been satisfactorily determined. The first is found in two manuscripts only, the so-called "Didot" (from its original possessor M. Firmin-Didot), now in the Bibliothèque Nationale, Paris; the other, and much superior text, in the Biblioteca Estense, Modena. In both cases the romance follows the prose rendering of Borron's *Joseph of Arimathea* and *Merlin*, and precedes a *Mort Artus*, thus forming part of a complete cycle. The text shows a curious mingling of sources; the real primitive Perceval story, the *Enfances*, is omitted; he grows up in his father's house and goes to court at his wish. Later, however, stories which certainly derive from an early non-Grail tradition are introduced, and there are references which imply a knowledge of the prose *Lancelot* and of Chrétien's poem. The romance is probably a somewhat late, and not very skilful, compilation. The other prose romance, the *Perlesvaus*, is decidedly superior in literary form, but here too we have a mingling of old and new elements. The *Enfances* story is omitted, and there are parallels with the German *Parzival*, with Wauchier de Denain and with Gerbert, while much is peculiar to the *Perlesvaus* itself. It is not improbable that it represents a free and individual working over of the original Fescamp version, and that in its later shape it was intended to form, and did at one time form, the *Quest* section of the cyclic redaction of the Arthurian prose romances, being dislodged from this position by the Galahad *Quête*. It is a curious fact that the printed editions always give it in conjunction with this latter and that the two have also been preserved together in a Welsh manuscript translation. We also possess in one of the so-called *Mabinogi* a Welsh version of the tale, *Peredur, son of Evrawc*. This appears to be a free rendering of the adventures found in Chrétien combined with incidents drawn from Welsh tradition. This was at one time claimed as the original source of all the Perceval romances, but this theory cannot be maintained in face of the fact that the writer gives in one place what is practically a literal translation of Chrétien's text in a passage which there is strong reason to believe was borrowed by Chrétien from an earlier poem. In order of time the *Peredur* probably ranks latest in the series of Perceval romances, which, however, does not detract from its interest as a possible representative of genuine Welsh traditions, unknown to other writers.

The value and interest of the Perceval romances stand very high, not alone for their intrinsic merit, though that is considerable—Chrétien's *Perceval*, though not his best poem, is a favourable specimen of his work, and von Eschenbach's *Parzival*, though less elegant in style, is by far the most humanly interesting, and at the same time, most deeply spiritual, of the Grail romances—but also for the interest of the subject-matter. The Perceval story is an admirable folk-tale, the Grail problem is the most fascinating problem of medieval literature; the two combined form a romance of quite unique charm and interest. This has been practically proved by the extraordinary success which has attended Richard Wagner's dramatic re-telling of the legend in his *Parsifal*. The immediate source of this version is the poem of Wolfram von Eschenbach, though the Grail, of course, is represented in the form of the Christian relic, not as the jewel talisman of the *Parzival*; but the psychological reading of the hero's character, the distinctive note of von Eschenhach's version, has been adapted by Wagner with marvellous skill, and his picture of the hero's mental and spiritual development, from extreme simplicity to the wisdom born of perfect charity, is most striking and impressive.

BIBLIOGRAPHY.—There are early printed editions of the *Perceval* (1530) and of the *Perlesvaus* (1516 and 1523). The *Perceval* was edited from the Mons text by Potvin (6 vols., 1866–1871); *Syr Percyvelle of Galles*, in *The Thornton Romances*, by Halliwell (1844) for the Camden Society. *Parzival* exists in numerous editions; critical texts have been edited by Lachmann (1891), Martin (1903) and Leitzmann (1902–1903). For the general reader the most useful text is that of Bartsch in *Deutsche Classiker des Mittelalters*, as it includes notes and a glossary. Modern German versions are by Simrock (very close to the original) and Hertz (freer, but with excellent notes and appendices); Eng. trans. by J. L. Weston (1894). The "Didot" *Perceval* was published by Hucher in vol. i. of *Le Saint Graal* (1875–1878); an edition of the Modena text has also been prepared. *Perlesvaus* was published by Potvin in vol. i. of his edition of Chrétien's poem. The Welsh text, with translation, has been edited by Canon Williams. A fine translation by Dr Sebastian Evans is published in "The Temple Classics," under the title of *The High History of the Holy Grail*. *Peredur* will be found in Alfred Nutt's edition of the *Mabinogion* (1902). For the critical treatment of the subject see *The Legend of Sir Perceval* (Grimm Library, vol. xvii.); *Perlesvaus* by Nitze (1902); *Legends of the Wagner Drama* by J. L. Weston. (J. L. W.)

PERCEVAL, SPENCER (1762–1812), prime minister of England from 1809 to 1812, second son of John, 2nd earl of Egmont, was born in Audley Square, London, on the 1st of November 1762. He was educated at Harrow and at Trinity College, Cambridge, and was called to the bar at Lincoln's Inn in 1786. A very able speech in connexion with a famous forgery case having drawn attention to his talents, his success was from that time rapid, he was soon regarded as the leading counsel on the Midland circuit, and in 1796 became a K.C. Entering parliament for Northampton in April of that year, he distinguished himself by his speeches in support of the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic Emancipation, he delivered in 1807 a speech on the subject which helped to give the deathblow to the Grenville administration, upon which he became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Notwithstanding that he had the assistance in the cabinet of no statesman of the first rank, he succeeded in retaining office till he was shot by a man named Bellingham, a bankrupt with a grievance, who had vainly applied to him for redress, in the lobby of the House of Commons on the 11th of May 1812. Bellingham was certainly insane, but the plea was set aside and he was hanged. Perceval was a vigorous debater, specially excelling in replies, in which his thorough mastery of all the details of his subject gave him a great advantage. He married in 1790 and had six sons and six daughters; one of the latter married Spencer Horatio Walpole (d. 1898), home secretary, and their son Sir Spencer Walpole, the well-known historian, published an excellent biography of Perceval in 1874.

See also P. Treherne, *Spencer Perceval* (1909).

PERCH (through Fr. from Lat. *perca*, Gr. πέρκη; the last word is connected with περκνός, dark-coloured, spotted), a fresh-water fish (*Perca fluviatilis*), generally distributed over Europe, northern Asia and North America, and so well known as to have been selected for the type of an entire family of spiny-rayed fishes, the *Percidae*, which is represented in European fresh-waters by several other fishes such as the pope (*Acerina cernua*) and the pike-perch (*Lucioperca*). It inhabits rivers as well as lakes, but thrives best in waters with a depth of not less than 3 ft.; in large deep lakes it frequently descends to depths of 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel, but does not extend to Iceland or any of the islands north of Europe. In the Alps it ascends to an altitude of 4000 ft.

The shape of its body is well proportioned, but many variations occur, some specimens being singularly high-backed, others low and long-bodied; sometimes such variations are local, and Agassiz and other naturalists at one time thought it possible to distinguish two species of the common perch of Europe; there are not even sufficient grounds, however, for separating specifically the North American form, which in the majority of ichthyological works is described as *Perca flavescens*. The brilliant and striking colours of the perch render it easily recognizable even at a distance. A rich greenish-brown with golden reflections covers the back and sides, which are ornamented with five or seven dark cross-bands. A large black spot occupies the

The Perch, *Perca fluviatilis*.

membrane between the last spines of the dorsal fin; and the ventral, anal and lower part of the caudal are bright vermilion. In the large peaty lakes of north Germany a beautiful variety is not uncommon, in which the golden tinge prevails, as in a goldfish.

The perch is strictly carnivorous and most voracious; it wanders about in small shoals within a certain district, playing sad havoc among small fishes, and is therefore not to be tolerated in waters where valuable fry is cultivated. Perch of three pounds in weight are not infrequently caught in suitable localities; one of five would now be regarded as an extraordinarily large specimen, although in older works we read of individuals exceeding even that weight.

Perch are good, wholesome food, and highly esteemed in inland countries where marine fish can be obtained only with difficulty. The nearly allied pike-perch is one of the best European food-fishes. The perch is exceedingly prolific; it begins to spawn when three years old, in April or in the first half of May, depositing the ova, which are united by a viscid matter in lengthened or net-shaped bands, on water plants.

PERCH (through Fr. *perche* from Lat. *pertica*, a pole or rod used for measurement), a bar or rod used for various purposes, as *e.g.* for a navigation mark in shallow waters, for a support on which a bird may rest, or for a pole which joins the back with the fore part of a wagon or other four-wheeled vehicle. As a term of linear measurement, "perch," also "rod" or "pole," = 16½ ft., 5½ yds.; of superficial area, = 30¼ sq. yds.; 160 perches = 1 acre. As a stonemason's measure, a "perch" = 1 linear perch in length by 1½ ft. in breadth and 1 ft. in thickness.

PERCHE, a region of northern France extending over the departments of Orne, Eure, Eure-et-Loir and Sarthe. Its boundaries are Normandy on the N. and W., Maine on the S.W., Vendômois and Dunois on the S., Beauce on the E. and Thimerais on the N.E. The greater part of the district is occupied by a semicircle of heights (from 650 to 1000 ft. in height) stretching from Moulins-la-Marche on the north-west to Montmirail on the south; within the basin formed thereby the shape of which is defined by the Huisne, an affluent of the Sarthe, lie the chief towns—Mortagne, Nogent-le-Rotrou and Bellême. Stock-raising and dairy-farming are flourishing in the Perche, which is famous for the production of a breed of large and powerful horses. Cider-apples and pears are grown throughout the district. In the middle ages the Perche constituted a countship of which Corbon, Mortagne and Nogent-le-Rotrou were successively the capitals. Under the *ancien régime* it formed, together with Maine, a *gouvernement* of which Mortagne was the capital.

PERCIVAL, JAMES GATES (1795–1856), American poet, philologist and geologist, was born in Kensington parish, Berlin, Connecticut, on the 15th of September 1795. He graduated at Yale in 1815, and in 1820 took the degree of M.D., and started practice in Berlin. He contributed verse to the *Microscope*, a semi-weekly paper, founded at New Haven in 1820. In this first appeared his best-known poem, "The Suicide," which reflects his chronic melancholy, due doubtless to ill health; it was begun in 1816 and finished in 1820, after he had actually made two attempts on his own life. In 1823 Percival became an editor of the *Connecticut Herald* at New Haven; and in 1824 he was in turn an assistant-surgeon and lecturer on chemistry at West Point, and an inspector of recruits at the Charlestown (Mass.) Navy Yard. He prepared (1826–1831) an English edition of Malte-Brun's *Geography* (published 1834); and in 1827–1829 read the manuscripts and proof-sheets of *Webster's Dictionary*, giving special attention to scientific words. In 1835–1840, with Professor Charles U. Shepard (1804–1886), he made a geological survey of Connecticut; his *Report* (1842) showed great learning and much patient research. In 1854 he became state geologist of Wisconsin, and in 1855 published one volume of his *Report*; the second he had nearly completed at the time of his death, on the 22nd of May 1856, at Hazel Green, Wisconsin.

See his *Poetical Works* (2 vols., Boston, 1859), with a biographical sketch by L. W. Fitch; and Julius H. Ward, *Life and Letters of James Gates Percival* (Boston, 1866).

PERCY (Family). This family, whose deeds are so prominent in English history, was founded by William de Perci (*c.* 1030–1096), a follower of the Conqueror, who bestowed on him a great fief in Yorkshire and Lincolnshire. The register of Whitby Abbey, which he founded anew, and in later days the heralds, were responsible for the fabulous origin and pedigree of the family which are still current. By Emma, daughter of Hugh de Port, a great Hampshire baron, William was father of several sons, of whom Alan the eldest succeeded him. His grandson William was the last of the house in the direct line, and left two sisters and co-heiresses, Maud countess of Warwick, who died childless, and Agnes. Agnes de Perci had married Josceline, styled "brother of the queen" (*i.e.* Adeliza of Louvain, second wife of Henry I.), whose legitimacy has been questioned, and from this marriage descended the second house of Percy (which name it assumed), till its own extinction in the male line five centuries later (1670). By it was brought into the family the great Petworth estate in Sussex, which Josceline had obtained from his sister, who was holding Arundel and its fief. His son Richard (*c.* 1170–1244) and Richard's nephew William (*c.* 1183–1245) were among the barons who rose in arms against John, but the latter made his peace with Henry III., and had his lands restored to him. Richard de Percy was one of the twenty-five barons appointed to enforce the observance of Magna Carta.

The next important member of the family is William's grandson Henry de Percy (*c.* 1272–1315), whom Edward I., after the deposition of John Baliol, appointed governor of Galloway, and who was one of his most active agents in the subjugation of Scotland till the success of Robert Bruce drove him out of Turnberry Castle, and made him withdraw into England. He was rewarded by Edward II. with the barren title of earl of Carrick, declared to be forfeited by the Scottish hero; and the same king appointed him governor of the castles of Bamburgh and Scarborough. But in 1309 he himself made his position strong in the north of England by purchasing lands from Anthony Bek, bishop of Durham, among which was the honour of Alnwick, the principal seat of the family ever since. The Percys had chiefly resided till then at Spofforth in Yorkshire, and their connexion with Northumberland dates from this acquisition. Henry's son, another Henry (*c.* 1299–1352), took part in the league against Edward II.'s favourites the Despensers, was in favour with Edward III., and obtained from Edward Baliol as king of Scotland grants of Lochmaben, Annandale and Moffatdale, which he surrendered to the English king for the castle and constableship of Jedburgh, or Jedworth, with the forest of Jedworth and some neighbouring towns. A few years later, in fuller recompense of the unprofitable gift of Baliol, a grant of 500 marks a year was made to him out of the old customs at Berwick;

differs widely in the setting of his story. He gives an introduction, in which the adventures of the father, here a prince of Anjou, are related; a conclusion, in which the Swan-Knight, Lohengrin, is made Parzival's son; he represents the inhabitants of the Grail castle as Templars (Templeisen); and makes the Grail itself a stone. Finally, he reproaches Chrétien with having told the story amiss, whereas Kiot, the Provençal, whose version Wolfram was following, had told it aright from beginning to end. It is certain that Gerbert knew, and used, a *Perceval* which, if not Kiot's poem, must have been closely akin to it; as he too makes the Swan-Knight a descendant of the Grail hero. The probability seems to be that the earliest Perceval-Grail romance was composed at Fescamp, and was coincident with the transformation, under the influence of the *Saint-Sang* legend, of the originally Pagan talisman known as the Grail into a Christian relic, and that this romance was more or less at the root of all subsequent versions.

Besides the poems, we have also two prose Perceval romances, the relative position of which has not yet been satisfactorily determined. The first is found in two manuscripts only, the so-called "Didot" (from its original possessor M. Firmin-Didot), now in the Bibliothèque Nationale, Paris; the other, and much superior text, in the Biblioteca Estense, Modena. In both cases the romance follows the prose rendering of Borron's *Joseph of Arimathea* and *Merlin*, and precedes a *Mort Artus*, thus forming part of a complete cycle. The text shows a curious mingling of sources; the real primitive Perceval story, the *Enfances*, is omitted; he grows up in his father's house and goes to court at his wish. Later, however, stories which certainly derive from an early non-Grail tradition are introduced, and there are references which imply a knowledge of the prose *Lancelot* and of Chrétien's poem. The romance is probably a somewhat late, and not very skilful, compilation. The other prose romance, the *Perlesvaus*, is decidedly superior in literary form, but here too we have a mingling of old and new elements. The *Enfances* story is omitted, and there are parallels with the German *Parzival*, with Wauchier de Denain and with Gerbert, while much is peculiar to the *Perlesvaus* itself. It is not improbable that it represents a free and individual working over of the original Fescamp version, and that in its later shape it was intended to form, and did at one time form, the *Quest* section of the cyclic redaction of the Arthurian prose romances, being dislodged from this position by the Galahad *Quête*. It is a curious fact that the printed editions always give it in conjunction with this latter and that the two have also been preserved together in a Welsh manuscript translation. We also possess in one of the so-called *Mabinogi* a Welsh version of the tale, *Peredur, son of Evrawc*. This appears to be a free rendering of the adventures found in Chrétien combined with incidents drawn from Welsh tradition. This was at one time claimed as the original source of all the Perceval romances, but this theory cannot be maintained in face of the fact that the writer gives in one place what is practically a literal translation of Chrétien's text in a passage which there is strong reason to believe was borrowed by Chrétien from an earlier poem. In order of time the *Peredur* probably ranks latest in the series of Perceval romances, which, however, does not detract from its interest as a possible representative of genuine Welsh traditions, unknown to other writers.

The value and interest of the Perceval romances stand very high, not alone for their intrinsic merit, though that is considerable—Chrétien's *Perceval*, though not his best poem, is a favourable specimen of his work, and von Eschenbach's *Parzival*, though less elegant in style, is by far the most humanly interesting, and at the same time, most deeply spiritual, of the Grail romances—but also for the interest of the subject-matter. The Perceval story is an admirable folk-tale, the Grail problem is the most fascinating problem of medieval literature; the two combined form a romance of quite unique charm and interest. This has been practically proved by the extraordinary success which has attended Richard Wagner's dramatic re-telling of the legend in his *Parsifal*. The immediate source of this version is the poem of Wolfram von Eschenbach, though the Grail, of course, is represented in the form of the Christian relic, not as the jewel talisman of the *Parzival*; but the psychological reading of the hero's character, the distinctive note of von Eschenhach's version, has been adapted by Wagner with marvellous skill, and his picture of the hero's mental and spiritual development, from extreme simplicity to the wisdom born of perfect charity, is most striking and impressive.

Bibliography.—There are early printed editions of the *Perceval* (1530) and of the *Perlesvaus* (1516 and 1523). The *Perceval* was edited from the Mons text by Potvin (6 vols., 1866–1871); *Syr Percyvelle of Galles*, in *The Thornton Romances*, by Halliwell (1844) for the Camden Society. *Parzival* exists in numerous editions; critical texts have been edited by Lachmann (1891), Martin (1903) and Leitzmann (1902–1903). For the general reader the most useful text is that of Bartsch in *Deutsche Classiker des Mittelalters*, as it includes notes and a glossary. Modern German versions are by Simrock (very close to the original) and Hertz (freer, but with excellent notes and appendices); Eng. trans. by J. L. Weston (1894). The "Didot" *Perceval* was published by Hucher in vol. i. of *Le Saint Graal* (1875–1878); an edition of the Modena text has also been prepared. *Perlesvaus* was published by Potvin in vol. i. of his edition of Chrétien's poem. The Welsh text, with translation, has been edited by Canon Williams. A fine translation by Dr Sebastian Evans is published in "The Temple Classics," under the title of *The High History of the Holy Grail*. *Peredur* will be found in Alfred Nutt's edition of the *Mabinogion* (1902). For the critical treatment of the subject see *The Legend of Sir Perceval* (Grimm Library, vol. xvii.); *Perlesvaus* by Nitze (1902); *Legends of the Wagner Drama* by J. L. Weston. (J. L. W.)

PERCEVAL, SPENCER (1762–1812), prime minister of England from 1809 to 1812, second son of John, 2nd earl of Egmont, was born in Audley Square, London, on the 1st of November 1762. He was educated at Harrow and at Trinity College, Cambridge, and was called to the bar at Lincoln's Inn in 1786. A very able speech in connexion with a famous forgery case having drawn attention to his talents, his success was from that time rapid, he was soon regarded as the leading counsel on the Midland circuit, and in 1796 became a K.C. Entering parliament for Northampton in April of that year, he distinguished himself by his speeches in support of the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic Emancipation, he delivered in 1807 a speech on the subject which helped to give the deathblow to the Grenville administration, upon which he became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Notwithstanding that he had the assistance in the cabinet of no statesman of the first rank, he succeeded in retaining office till he was shot by a man named Bellingham, a bankrupt with a grievance, who had vainly applied to him for redress, in the lobby of the House of Commons on the 11th of May 1812. Bellingham was certainly insane, but the plea was set aside and he was hanged. Perceval was a vigorous debater, specially excelling in replies, in which his thorough mastery of all the details of his subject gave him a great advantage. He married in 1790 and had six sons and six daughters; one of the latter married Spencer Horatio Walpole (d. 1898), home secretary, and their son Sir Spencer Walpole, the well-known historian, published an excellent biography of Perceval in 1874.

See also P. Treherne, *Spencer Perceval* (1909).

PERCH (through Fr. from Lat. *perca*, Gr. πέρκη; the last word is connected with περκνός, dark-coloured, spotted), a fresh-water fish (*Perca fluviatilis*), generally distributed over Europe, northern Asia and North America, and so well known as to have been selected for the type of an entire family of spiny-rayed fishes, the *Percidae*, which is represented in European fresh-waters by several other fishes such as the pope (*Acerina cernua*) and the pike-perch (*Lucioperca*). It inhabits rivers as well as lakes, but thrives best in waters with a depth of not less than 3 ft.; in large deep lakes it frequently descends to depths of 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel, but does not extend to Iceland or any of the islands north of Europe. In the Alps it ascends to an altitude of 4000 ft.

slain in the battle, though not, as is stated by Walsingham, by Percy's hand: Henry Percy was captured by Sir John Montgomery, and his brother Ralph by Sir John Maxwell. Hotspur was released on the payment of a heavy ransom, to which Richard II. contributed £3000, and in the autumn his term as warden of Carlisle and the West March was extended to five years. In 1399 together with his father he joined Henry of Lancaster. Henry IV. gave the charge of the West March to Northumberland, while Henry Percy received the castles of Bamburgh, Roxburgh and Berwick, and the wardenship of the East March, with a salary of £3000 in peace time and £12,000 in war. During the first year of Henry's reign Hotspur further was appointed justiciar of North Wales and constable of the castles of Chester, Flint, Conway, Denbigh and Carnarvon. Henry also gave him a grant of the island of Anglesey, with the castle of Beaumaris. William and Rees ap Tudor captured Conway Castle on the 1st of April 1401, and Percy in company with the prince of Wales set out to recover the place, Percy providing the funds. In May he reported to the king the pacification of Merioneth and Carnarvon, and before the end of the month Conway was surrendered to him. Meanwhile he wrote demanding arrears of pay, with the threat of resignation if the money were not forthcoming, but the king intimated that the loss of Conway had been due to his negligence, and only sent part of the money. He had the same difficulty in obtaining money for his northern charge that he had experienced in Wales.[1] Anglesey was taken from him, and he was deprived of Roxburgh Castle in favour of his rival, the earl of Westmorland. The Scots again invaded England in the autumn of 1402, headed by the earl of Douglas and Murdoch Stewart, son of the duke of Albany. Northumberland and Hotspur barred their way at Millfield, near Wooler, and the Scots were compelled to fight at Humbledon, or Homildon Hill, on the 14th of September. The English archers were provided with a good target in the masses of the Scottish spearmen, and Hotspur was restrained from charging by his ally, George Dunbar, earl of March. The Scottish army was almost destroyed, while the English loss is said to have been five men. Disputes with the king arose over the disposal of the Scottish prisoners, Percy insisting on his right to hold Douglas as his personal prisoner, and he was summoned to court to explain. It is related that when he arrived Henry asked for Douglas, and Hotspur demanded in return that his brother-in-law, Edmund Mortimer, should be allowed to ransom himself from Owen Glendower, with whom he was a prisoner. High words followed, in the course of which Henry called Percy a traitor, struck him on the face, and drew his sword on him. Percy is said to have answered this defiance with the words, "Not here, but on the field." This was late in 1402, and in 1403 Hotspur issued a proclamation in Cheshire stating that Richard II. was alive, and summoning the inhabitants to his standard. He made common cause with his prisoner Douglas, and marched south to join forces with Glendower, who was now reconciled with Mortimer. He was reinforced by his uncle Thomas, earl of Worcester, who, although steward to the household of the prince of Wales, joined his family in rebellion. The mythical Richard II. was heard of no more, and Percy made himself the champion of the young earl of March. When he arrived at the Castle Foregate, Shrewsbury, early on the 21st of July, and demanded provisions, he found the king's forces had arrived before him. He retired in the direction of Whitchurch, and awaited the enemy about 3½ m. from Shrewsbury. After a long parley, in which a truce of two days was even said to have been agreed on, the Scottish earl of March, fighting on the royal side, forced on the battle in the afternoon, the royal right being commanded by the prince of Wales. Hotspur was killed, the earls of Douglas and Worcester, Sir Richard Venables of Kinderton, and Sir Richard Vernon were captured, and the rebel army dispersed. Worcester, Venables and Vernon were executed the next day. Percy's body was buried at Whitchurch, but was disinterred two days later to be exhibited in Shrewsbury. The head was cut off, and fixed on one of the gates of York.

[1] The dissatisfaction of the Percys seems to have been chiefly due to the money question. Sir J. H. Ramsay (*Lancaster and York*) estimates that in the four years from 1399 to 1403 they had received from the king the sum of £41,750, which represented a very large capital in the 14th century, and they had also received considerable grants of land. King Henry IV. was about to march north himself to look into the real relations between the Percys and the Scots, when on the 6th of July 1403 Henry Percy was in open rebellion.

See NORTHUMBERLAND, EARLS AND DUKES OF; and PERCY: (*Family*). Also *Chronique de la traïson et mort de Richard II.*, ed. B. Williams (Eng. Hist. Soc., 1846); J. Creton, *Histoire du roy Richard II.*, ed. John Webb, in *Archaeologia* (xx., 1824); and Adam of Usk's *Chronicon*, 1377–1404, ed. E. M. Thompson (1876); the authorities are cited in detail in J. H. Wylie's *England under Henry IV.* (1884–1898), and Sir J. H. Ramsay's *Lancaster and York* (Oxford, 1892). Holinshed's *Chronicle* was the chief source of Shakespeare's account of Hotspur in *Henry IV.*

PERCY, THOMAS (*c.* 1560–1605), one of the Gunpowder Plot conspirators, was a son of Edward Percy of Beverley, who was grandson of Henry Percy, 4th earl of Northumberland. Though brought up a Protestant, he early became well-affected to the Roman Catholics and finally an adherent. He entered the service of his cousin, Henry Percy, 9th earl of Northumberland, and was appointed by him constable of Alnwick Castle and agent for his northern estates, in which capacity he showed himself tyrannical and extortionate. In 1602 he was sent by Northumberland to James in Scotland to secure toleration for the Roman Catholics and returned announcing favourable promises from the king, the extent of which he probably greatly exaggerated; and when James, after his succession to the English throne, did not immediately abrogate the penal laws, Percy, although he had accepted the court appointment of gentleman pensioner, professed himself highly indignant and indulged himself in thoughts of revenge. Some time in May 1603 Percy angrily declared his intention to Catesby of killing the king, and in April 1604 he met Catesby with John Wright, Thomas Winter and Guy Fawkes, and was then initiated into Catesby's gunpowder plot, which met with his zealous approval and support. To Percy was allotted the special duty after the explosion of seizing the infant prince Charles and riding off with him on his saddle to Warwickshire. All the preparations being complete, Percy went to Alnwick in October and collected £3000 of the earl of Northumberland's rents which he intended using in furtherance of the plot, returning to London on the 1st of November. Meanwhile the plot had been revealed through the letter to Lord Monteagle on the 26th of October, and it was Percy's insistence at the last meeting of the conspirators on the 3rd that decided them not to fly but to hazard the attempt. On the news of Guy Fawkes's arrest, Percy with the rest of the conspirators, except Tresham, fled on horseback, taking refuge ultimately at Holbeche, near Stourbridge, in Staffordshire, where on the 8th of November, during the attack of the sheriff's men upon the house, he was struck down by a bullet, fighting back to back with Catesby, and died two days later. Percy married a sister of the conspirator John Wright and left a son Robert and two daughters, one of whom is said to have married Robert, the son of Catesby.

PERCY, THOMAS (1729–1811), bishop of Dromore, editor of the *Percy Reliques*, was born at Bridgnorth on the 13th of April 1729. His father, Arthur Lowe Percy, a grocer, was of sufficient means to send his son to Christ Church, Oxford, in 1746. He graduated in 1750 and proceeded M.A. in 1753. In the latter year he was appointed to the vicarage of Easton Maudit, Northamptonshire, and three years later was instituted to the rectory of Wilby in the same county, benefices which he retained until 1782. In 1759 he married Anne, daughter of Barton Gutteridge. At Easton Maudit most of the literary work for which he is now remembered—including the *Reliques*—was completed. When his name became famous he was made domestic chaplain to the duke and duchess of Northumberland, and was tempted into the belief that he belonged to the illustrious house of Percy. Through his patron's influence he became dean of Carlisle in 1778 and bishop of Dromore in Ireland in 1782. His wife died before him in 1806; the good bishop, blind but otherwise in

differs widely in the setting of his story. He gives an introduction, in which the adventures of the father, here a prince of Anjou, are related; a conclusion, in which the Swan-Knight, Lohengrin, is made Parzival's son; he represents the inhabitants of the Grail castle as Templars (Templeisen); and makes the Grail itself a stone. Finally, he reproaches Chrétien with having told the story amiss, whereas Kiot, the Provençal, whose version Wolfram was following, had told it aright from beginning to end. It is certain that Gerbert knew, and used, a *Perceval* which, if not Kiot's poem, must have been closely akin to it; as he too makes the Swan-Knight a descendant of the Grail hero. The probability seems to be that the earliest Perceval-Grail romance was composed at Fescamp, and was coincident with the transformation, under the influence of the *Saint-Sang* legend, of the originally Pagan talisman known as the Grail into a Christian relic, and that this romance was more or less at the root of all subsequent versions.

Besides the poems, we have also two prose Perceval romances, the relative position of which has not yet been satisfactorily determined. The first is found in two manuscripts only, the so-called "Didot" (from its original possessor M. Firmin-Didot), now in the Bibliothèque Nationale, Paris; the other, and much superior text, in the Biblioteca Estense, Modena. In both cases the romance follows the prose rendering of Borron's *Joseph of Arimathea* and *Merlin*, and precedes a *Mort Artus*, thus forming part of a complete cycle. The text shows a curious mingling of sources; the real primitive Perceval story, the *Enfances*, is omitted; he grows up in his father's house and goes to court at his wish. Later, however, stories which certainly derive from an early non-Grail tradition are introduced, and there are references which imply a knowledge of the prose *Lancelot* and of Chrétien's poem. The romance is probably a somewhat late, and not very skilful, compilation. The other prose romance, the *Perlesvaus*, is decidedly superior in literary form, but here too we have a mingling of old and new elements. The *Enfances* story is omitted, and there are parallels with the German *Parzival*, with Wauchier de Denain and with Gerbert, while much is peculiar to the *Perlesvaus* itself. It is not improbable that it represents a free and individual working over of the original Fescamp version, and that in its later shape it was intended to form, and did at one time form, the *Quest* section of the cyclic redaction of the Arthurian prose romances, being dislodged from this position by the Galahad *Quête*. It is a curious fact that the printed editions always give it in conjunction with this latter and that the two have also been preserved together in a Welsh manuscript translation. We also possess in one of the so-called *Mabinogi* a Welsh version of the tale, *Peredur, son of Evrawc*. This appears to be a free rendering of the adventures found in Chrétien combined with incidents drawn from Welsh tradition. This was at one time claimed as the original source of all the Perceval romances, but this theory cannot be maintained in face of the fact that the writer gives in one place what is practically a literal translation of Chrétien's text in a passage which there is strong reason to believe was borrowed by Chrétien from an earlier poem. In order of time the *Peredur* probably ranks latest in the series of Perceval romances, which, however, does not detract from its interest as a possible representative of genuine Welsh traditions, unknown to other writers.

The value and interest of the Perceval romances stand very high, not alone for their intrinsic merit, though that is considerable—Chrétien's *Perceval*, though not his best poem, is a favourable specimen of his work, and von Eschenbach's *Parzival*, though less elegant in style, is by far the most humanly interesting, and at the same time, most deeply spiritual, of the Grail romances—but also for the interest of the subject-matter. The Perceval story is an admirable folk-tale, the Grail problem is the most fascinating problem of medieval literature; the two combined form a romance of quite unique charm and interest. This has been practically proved by the extraordinary success which has attended Richard Wagner's dramatic re-telling of the legend in his *Parsifal*. The immediate source of this version is the poem of Wolfram von Eschenbach, though the Grail, of course, is represented in the form of the Christian relic, not as the jewel talisman of the *Parzival*; but the psychological reading of the hero's character, the distinctive note of von Eschenhach's version, has been adapted by Wagner with marvellous skill, and his picture of the hero's mental and spiritual development, from extreme simplicity to the wisdom born of perfect charity, is most striking and impressive.

Bibliography.—There are early printed editions of the *Perceval* (1530) and of the *Perlesvaus* (1516 and 1523). The *Perceval* was edited from the Mons text by Potvin (6 vols., 1866–1871); *Syr Percyvelle of Galles*, in *The Thornton Romances*, by Halliwell (1844) for the Camden Society. *Parzival* exists in numerous editions; critical texts have been edited by Lachmann (1891), Martin (1903) and Leitzmann (1902–1903). For the general reader the most useful text is that of Bartsch in *Deutsche Classiker des Mittelalters*, as it includes notes and a glossary. Modern German versions are by Simrock (very close to the original) and Hertz (freer, but with excellent notes and appendices); Eng. trans. by J. L. Weston (1894). The "Didot" *Perceval* was published by Hucher in vol. i. of *Le Saint Graal* (1875–1878); an edition of the Modena text has also been prepared. *Perlesvaus* was published by Potvin in vol. i. of his edition of Chrétien's poem. The Welsh text, with translation, has been edited by Canon Williams. A fine translation by Dr Sebastian Evans is published in "The Temple Classics," under the title of *The High History of the Holy Grail*. *Peredur* will be found in Alfred Nutt's edition of the *Mabinogion* (1902). For the critical treatment of the subject see *The Legend of Sir Perceval* (Grimm Library, vol. xvii.); *Perlesvaus* by Nitze (1902); *Legends of the Wagner Drama* by J. L. Weston. (J. L. W.)

PERCEVAL, SPENCER (1762–1812), prime minister of England from 1809 to 1812, second son of John, 2nd earl of Egmont, was born in Audley Square, London, on the 1st of November 1762. He was educated at Harrow and at Trinity College, Cambridge, and was called to the bar at Lincoln's Inn in 1786. A very able speech in connexion with a famous forgery case having drawn attention to his talents, his success was from that time rapid, he was soon regarded as the leading counsel on the Midland circuit, and in 1796 became a K.C. Entering parliament for Northampton in April of that year, he distinguished himself by his speeches in support of the administration of Pitt. In 1801, on the formation of the Addington administration, he was appointed solicitor-general, and in 1802 he became attorney-general. An ardent opponent of Catholic Emancipation, he delivered in 1807 a speech on the subject which helped to give the deathblow to the Grenville administration, upon which he became chancellor of the exchequer under the duke of Portland, whom in 1809 he succeeded in the premiership. Notwithstanding that he had the assistance in the cabinet of no statesman of the first rank, he succeeded in retaining office till he was shot by a man named Bellingham, a bankrupt with a grievance, who had vainly applied to him for redress, in the lobby of the House of Commons on the 11th of May 1812. Bellingham was certainly insane, but the plea was set aside and he was hanged. Perceval was a vigorous debater, specially excelling in replies, in which his thorough mastery of all the details of his subject gave him a great advantage. He married in 1790 and had six sons and six daughters; one of the latter married Spencer Horatio Walpole (d. 1898), home secretary, and their son Sir Spencer Walpole, the well-known historian, published an excellent biography of Perceval in 1874.

See also P. Treherne, *Spencer Perceval* (1909).

PERCH (through Fr. from Lat. *perca*, Gr. πέρκη; the last word is connected with περκνός, dark-coloured, spotted), a fresh-water fish (*Perca fluviatilis*), generally distributed over Europe, northern Asia and North America, and so well known as to have been selected for the type of an entire family of spiny-rayed fishes, the *Percidae*, which is represented in European fresh-waters by several other fishes such as the pope (*Acerina cernua*) and the pike-perch (*Lucioperca*). It inhabits rivers as well as lakes, but thrives best in waters with a depth of not less than 3 ft.; in large deep lakes it frequently descends to depths of 50 fathoms and more. It occurs in Scandinavia as far north as the 69th parallel, but does not extend to Iceland or any of the islands north of Europe. In the Alps it ascends to an altitude of 4000 ft.

curves somewhat forward and again divides at least once; while the hind prong is of great length undivided, and directed backwards in a manner found in no other deer. As regards general form, the most distinctive feature is the great relative length of the tail, which reaches the hocks, and is donkey-like rather than deer-like in form. The head is long and narrow, with a prominent ridge for the support of the antlers, moderate-sized ears, and a narrow and pointed muzzle. A gland and tuft are present on the skin of the outer side of the upper part of the hind cannon-bone; but, unlike American deer, there is no gland on the inner side of the hock. Another feature by which this species differs from the American deer is the conformation of the bones of the lower part of the fore-leg, which have the same structure as in the red deer group. The coat is of moderate length, but the hair on the neck and throat of the old stags is elongated to form a mane and fringe. Although new-born fawns are spotted, the adults are in the main uniformly coloured; the general tint of the coat at all seasons being reddish tawny with a more or less marked tendency to grey. It has been noticed at Woburn Abbey that the antlers are shed and replaced twice a year.

The true home of this deer has never been ascertained, and probably never will be; all the few known specimens now living being kept in confinement—the great majority in the duke of Bedford's park at Woburn, Bedfordshire. (R. L.*)

PEREGRINUS PROTEUS (2nd cent. A.D.), Cynic philosopher, of Parium in Mysia. At an early age he was suspected of parricide, and was obliged to leave his native place. During his wanderings he reached Palestine, where he ingratiated himself with the Christian community, and became its virtual head. His fanatical zeal and craving for notoriety led to his imprisonment, but the governor of Syria let him go free, to prevent his posing as a martyr. He then returned to Parium to claim his paternal inheritance, but finding that the circumstances of his father's death were not yet forgotten, he publicly surrendered all claims to the property in favour of the municipality. He resumed his wandering life, at first assisted by the Christians, but having been detected profaning the rites of the Church, he was excommunicated. During a visit to Egypt he made the acquaintance of the famous Cynic Agathobulus and joined the sect. Meeting with little encouragement, he made his way to Rome, whence he was expelled for insulting the emperor Antoninus Pius. Crossing to Greece, he finally took up his abode at Athens. Here he devoted himself to the study and teaching of philosophy, and obtained a considerable number of pupils, amongst them Aulus Gellius, who speaks of him in very favourable terms. But, having given offence by his attacks on Herodes Atticus and finding his popularity diminishing, he determined to create a sensation. He announced his intention of immolating himself on a funeral pyre at the celebration of the Olympian games in 165, and actually carried it out. Lucian, who was present, has given a full description of the event.

C. M. Wieland's *Geheime Geschichte des Philosophen Peregrinus Proteus* (Eng. trans., 1796) is an attempt to rehabilitate his character. See also Lucian, *De morte Peregrini*; Aulus Gellius xii. 11; Ammianus Marcellinus xxix.; Philostratus, *Vit. Soph.* ii. 1, 33; J. Bernays, *Lucian und die Kyniker* (1875); E. Zeller, "Alexander und Peregrinus," in his *Vorträge und Abhandlungen*, ii. (1877).

PEREIRE [PEREIRA], **GIACOBBO RODRIGUEZ** (1715–1780), one of the inventors of deaf-mute language, a member of a Spanish-Jewish family, was born at Estremadura, Spain, on the 11th of April 1715. At the age of eighteen he entered a business at Bordeaux. Here he fell in love with a young girl who had been dumb from birth, and henceforth devoted himself to discover a method of imparting speech to deaf-mutes. His first subject was Aaron Baumann, a co-religionist, whom he taught to enunciate the letters of the alphabet, and to articulate certain ordinary phrases. He next devised a sign alphabet for the use of one hand only, and in 1749 he brought his second pupil before the Paris Academy of Sciences, the members of which were astonished at the results he had accomplished. In 1759 Pereire was made a member of the Royal Society of London. He died at Paris on the 15th of September 1780.

PEREKOP, a town of Russia, in the government of Taurida, 60 m. S.E. of Kherson, on the isthmus which connects the Crimea with the Continent, and commanding the once defensive ditch and dike which cross from the Black Sea to the Sivash (putrid) lagoon. Pop. about 5000. It was formerly an important place, with a great transit trade in salt, obtained from salt lakes in the immediate neighbourhood. Since the opening of the railway route from Kharkov to Simferopol in the Crimea Perekop has greatly declined. In ancient times the isthmus was crossed (about 1½ m. south of the present town) by a ditch which gave the name of Taphros to a Greek settlement. This line of defence having fallen into decay, a fort was erected and a new ditch and dike constructed in the 15th century by the Tatar khan of the Crimea, Mengli Ghirai, and by his son and successor Sahib Ghirai. The fort, known as Kapu or Or-Kapu, became the nucleus of the town. In the middle ages Perekop was known as Tuzla. In 1736 it was captured by the Russians under Münnich, and again in 1738 under Lascy (Lacy), who blew up the fort and destroyed a great part of the dike. In 1754 the fort was rebuilt by Krim Ghirei; but the Greek and Armenian inhabitants of Perekop formed a new settlement at Armyanskiy Bazar (Armenian Market), 3 m. farther south. Captured by the Russians in 1771, the town passed into Russian possession with the rest of the Crimea in 1783.

PEREMPTORY, an adjective adapted from the Roman law term *peremptorium edictum*, *peremptoria exceptio*, a decree or plea which put an end to or quashed (Lat. *perimere*, to destroy) an action, hence decisive, final. A similar use is found in English law in "peremptory challenge," a challenge to a jury allowed to a prisoner without cause shown, or "peremptory mandamus," an absolute command. The natural repugnance to a final order has given this word in its ordinary usage a sense of objectionable and intolerant emphasis.

PEREYASLAVL, a town of Russia, in the government of Poltava, 26 m. S.E. of the city of Kiev, at the confluence of the Trubezh and the Alta, which reach the Dnieper 5 m. lower down at the town's port, the village of Andrushi. Pop. 14,609. Besides the town proper there are three considerable suburbs. Though founded in 993 by Vladimir the Great of Moscow in memory of his signal success over the Turkish Pechenegs, Pereyaslavl has now few remains of antiquity. The town has a trade in grain, salt, cattle and horses, and some manufactures —tallow, wax, tobacco, candles and shoes.

From 1054 Pereyaslavl was the chief town of a separate principality. As a southern outpost it often figures in the 11th, 12th and 13th centuries, and was plundered by the Mongols in 1239. In later times it was one of the centres of the Cossack movement; and in 1628 the neighbourhood of the town was the scene of the extermination of the Polish forces known as "Tara's Night." It was by the Treaty of Pereyaslavl that in 1654 the Cossack chieftain Bogdan Chmielnicki acknowledged the supremacy of Tsar Alexis of Russia.

PEREYASLAVL (called *Zalyeskiy*, or "Beyond the Forest," to distinguish it from the older town in Poltava after which it was named), one of the oldest and most interesting cities in middle Russia, situated in the government of Vladimir, 45 m. N.E. of Moscow on the road to Yaroslavl, and on both banks of the Trubezh near its entrance into Lake Pleshchéevo. Pop. 8662. Pereyaslavl was formerly remarkable for the number and importance of its ecclesiastical foundations. Among those still standing are the 12th-century cathedral, with ancient wall-paintings and the graves of Demetrius, son of Alexander Nevsky, and other princes, and a church founded by Eudoxia (Euphrosyne), wife of Demetrius Donskoi, in the close of the 14th century. It is by its extensive cotton manufactures that Pereyaslavl is now best known. The fisheries in the lake (20 m. sq. in extent and 175 ft. deep) have long been of great value.

Founded in 1152 by Yuryi Dolgoruki, prince of Suzdal, Pereyaslavl soon began to play a considerable part in the history of the country. From 1195 till 1302 it had princes of its own; and the princes of Moscow, to whom it was at the latter date

bequeathed, kept it (apart from some temporary alienations in the 14th century) as part of their patrimony throughout the 15th and 16th centuries. Lake Pleshchéevo was the scene of Peter the Great's first attempts (1691) at creating a fleet.

PEREZ, ANTONIO (*c.* 1540–1611), for some years the favourite minister of Philip II. of Spain and afterwards for many more the object of his unrelenting hostility, was by birth an Aragonese. His reputed father, Gonzalo Perez, an ecclesiastic, has some place in history as having been secretary both to Charles V. and to Philip II., and in literature as author of a Spanish translation of the *Odyssey* (*La Ulyxea de Homero*, Antwerp, 1556). Antonio Perez, who was legitimated by an imperial diploma issued at Valladolid in 1542, was, however, believed by many to be in reality the son of Philip's minister, Ruy Gomez de Silva, prince of Eboli, to whom, on the completion of a liberal education at home and abroad, he appears at least to have owed his first introduction to a diplomatic career.[1] In 1567 he became one of the secretaries of state, receiving also about the same time the lucrative appointment of protonotary of Sicily, and in 1573 the death of Ruy Gomez himself made room for Perez's promotion to be head of the "despacho universal," or private bureau, from which Philip attempted to govern by assiduous correspondence the affairs of his vast dominions. Another of the king's secretaries at this time, though in a less confidential relation, was a friend and contemporary of Perez, named Juan de Escovedo, who, however, after the fall of Tunis in 1574, was sent off to supersede Juan de Soto as secretary and adviser of Don John of Austria, thus leaving Perez without a rival. Some time after Don John's appointment to the governorship of the Netherlands Perez accidentally became cognisant of his inconveniently ambitious "empresa de Inglaterra," in which he was to rescue Mary Queen of Scots, marry her, and so ascend the throne of England. The next step might even be against Spain itself. This secret scheme the faithful secretary at once carried to Philip, who characteristically resolved to meet it by quietly removing his brother's aider and abettor. With the king's full cognisance, accordingly, Perez, after several unsuccessful attempts to poison Escovedo, succeeded in procuring his assassination in a street of Madrid on the 31st of March 1578. The immediate effect was to raise Perez higher than ever in the royal confidence and favour, but, wary though the secretary had been, he had not succeeded in obliterating all trace of his connexion with the crime, and very soon a prosecution was set on foot by the representatives of the murdered man. For a time Philip was both willing and able to protect his accomplice, but ultimately he appears to have listened to those who, whether truly or falsely, were continually suggesting that Perez had had motives of his own, arising out of his relations with the princess of Eboli, for compassing the assassination of Don John's secretary; be this as it may, from trying to screen Perez the king came to be the secret instigator of those who sought his ruin. The process, as such matters often have been in Spain, was a slow one, and it was not until 1589 that Perez, after more than one arrest and imprisonment on a variety of charges, seemed on the eve of being convicted and condemned as the murderer of Escovedo. At this juncture he succeeded in making his escape from prison in Castile into Aragon, where, under the ancient "fueros" of the kingdom he could claim a public trial in open court, and so bring into requisition the documentary evidence he possessed of the king's complicity in the deed. This did not suit Philip, who, although he instituted a process in the supreme tribunal of Aragon, speedily abandoned it and caused Perez to be attacked from another side, the charge of heresy being now preferred, arising out of certain reckless and even blasphemous expressions Perez had used in connexion with his troubles in Castile. But all attempts to remove the accused from the civil prison in Saragossa to that of the Inquisition raised popular tumults, which in the end led to Perez's escape across the Pyrenees, but unfortunately also furnished Philip with a pretext for sending an army into Aragon and suppressing the ancient "fueros" altogether (1591). From the court of Catherine de Bourbon, at Pau, where he was well received, Perez passed to that of Henry IV. of France, and both there and in England his talents and diplomatic experience, as well as his well-grounded enmity to Philip, secured him much popularity. While in England he became the "intimate coach-companion and bed-companion" of Francis Bacon, and was also much in the society of the earl of Essex. The peace of Vervins in 1598 greatly reduced his apparent importance abroad, and Perez now tried to obtain the pardon of Philip III., that he might return to his native country. His efforts, however, proved vain, and he died in comparative obscurity in Paris on the 3rd of November 1611.

Perez's earliest publication was a small quarto, dedicated to the earl of Essex, written and apparently printed in England about 1594, entitled *Pedazos de historia*, and professedly published at Leon. A Dutch translation appeared in 1594, and in 1598 he published his *Relaciones*, including the *Memorial del hecho de su causa*, drawn up in 1590, and many of his letters. Much has been done, by Mignet (*Antonio Perez et Philippe II.*, 1845; 4th ed., 1874) and by Froude ("An Unsolved Historical Riddle," *Nineteenth Cent.*, 1883) among others, towards the elucidation of various difficult points in Perez's somewhat perplexing story. For the murder of Escovedo, see Andrew Lang's discussion of it in his *Historical Mysteries* (1904); and the *Españoles é ingleses* (1903) of Major Martin Hume, who had access to various newly discovered MSS.

[1] On the other hand it is suggested that this story of his being the son of Gomez was only circulated by Ruy Gomez's wife, Ana de Mendoza, as a refutation of the possibility of a supposed amour between her and Perez. It is contended by Mignet that this intrigue between her and Perez was known to Escovedo, and that this accounts for the part played by Perez in Escovedo's murder, because Ana had also been Philip's mistress, and Escovedo might have made mischief between Philip and Perez. Major Hume appears to combine the latter theory with Philip's political objection to Escovedo.

PÉREZ GALDÓS, BENITO (1845–), was born at Las Palmas, in the Canary Islands, on the 10th of May 1845. In 1863 he was sent to Madrid to study law, drifted into literature, and was speedily recognized as one of the most promising recruits on the Liberal side. Shortly after the Revolution of 1868 he abandoned journalism, and employed fiction as the vehicle for propagating advanced opinions. His first novel, *La Fontana de oro*, was printed in 1871, and later in the same year appeared *El Audaz*. The reception given to these early essays encouraged the writer to adopt novel-writing as a profession. He had already determined upon the scheme of his *Episodios nacionales*, a series which might compare with the *Comédie humaine*. Old charters, old letters, old newspapers were collected by him with the minuteness of a German archivist; no novelist was ever more thoroughly equipped as regards the details of his period. *Trafalgar*, the first volume of the *Episodios nacionales*, appeared in 1879; the remaining books of this first series are entitled *La Cort de Carlos IV.*, *El 19 de marzo y el 2 de mayo*, *Bailén*, *Napoleón en Chamartín*, *Zaragoza*, *Gerona*, *Cadiz*, *Juan Martín el Empecinado* and *La Batalla de Arpiles*. As the titles suffice to show, the author's aim was to write the national epic of the 19th century in prose; and he so completely succeeded that, long before the first series ended in 1881, he took rank among the foremost novelists of his time. A second series of *Episodios nacionales*, beginning with *El Equipaje del rey José* and ending with a tenth volume, *Un Faccioso más y algunas frailes menos*, was brought to a close in 1883, and was, like its predecessor, a monument of industry and exact knowledge, of realism and romantic conception; and he carried on the *Episodios nacionales* into a fourth series, raising the total of volumes to forty. In fecundity and in the power of creating characters, Pérez Galdós vies with Balzac. Parallel with his immense achievement in historical fiction, Pérez Galdós published a collection of romances dealing with contemporary life, its social problems and religious difficulties. Of these the best known, and perhaps the best, are *Doña Perfecta* (1876); *Gloria* (1877); *La Familia de León Roch* (1878); *Marianela* (1878); *Fortunata y Jacinta* (1887); and *Angel Guerra* (1891). Nor does this exhaust his prodigious activity. Besides adapting several of his novels for stage purposes, he wrote original dramas such as *La Loca de la casa* (1893), *San Quintín* (1894), *Electra* (1900) and *Mariucha* (1904); but his diffuse, exuberant genius

was scarcely accommodated to the convention of theatrical form. Pérez Galdós became a member of the Spanish Academy, and was also elected to the Cortes; but it is solely as a romancer that his name is familiar wherever Spanish is spoken, as a national novelist of fertile talent, and a most happy humorist who in his eccentrics and oddities is hardly inferior to Dickens. (J. F.-K.)

PERFUMERY (Lat. *per*, through, and *fumare*, to smoke), the preparation of perfumes, or substances which are pleasing to the sense of smell. Perfumes may be divided into two classes, the first of which includes all primitive or simple odoriferous bodies derived from the animal or vegetable kingdom, as well as the definite chemical compounds specially manufactured, while the second comprises the various "bouquets" or "mélanges" made by blending two or more of the foregoing in varying proportions—toilet powders, dentifrices, sachets, &c. To the former class belong (1) the animal products, ambergris, castor, civet, musk; (2) the essential oils (also called attars), mostly procured by the distillation of the stems, leaves, flowers and other parts of plants; (3) the philicome butters or oils, which are either solid or liquid fats charged with odours by the processes of inflowering or maceration; (4) the odoriferous gum-resins or balsams which exude naturally or from wounds in the trunks of various trees and shrubs, such as benzoin, opoponax, Peru, Tolu, storax, myrrh; (5) the large number of synthetic perfumes which simulate the odour of the natural scents. The second class contains the endless combination of tinctures sold under fancy names which may or may not afford a clue to their composition, such as "comédie française," "eau de senteur," "eau de Cologne," "lavendre ambrée," "blumengeist." In general, they are mixtures of a number of perfumes dissolved in alcohol. Strictly speaking, most of the perfumes on the market belong to the second class, since, in most cases, they are prepared by blending various natural or artificial odorous principles.

Natural Perfumes.—The animal perfumes are extremely limited in number. Ambergris (*q.v.*), one of the most important, is secreted by the sperm whale; musk (*q.v.*), the best known scent of this class, is secreted by the male musk-deer and other animals—musk-ox, musk-rat, &c.; civet (*q.v.*) is a musky scent named from the animal which secretes it; and castor or castoreum is a somewhat similar secretion of the beaver (*q.v.*). More important are the scents yielded by flowering plants. As a general rule fragrant flowers flourish in hot climates, but the more delicate perfumes are yielded by plants having a colder habitat; it must be remembered, however, that some costly perfumes are obtained from the plants of Ceylon, the East Indies, Mexico and Peru. In Europe, Grasse, Cannes and Nice are the centres of the natural perfume industry. Cannes is famous for its rose, acacia, jasmine and neroli oil; Nîmes for its thyme, rosemary and lavender; and Nice for its violets. Citron and orange oil come from Sicily; iris and bergamot from Italy; and roses are extensively cultivated in Bulgaria, and in European Turkey. England is unsurpassed for its lavender and peppermint, which flourish at Mitcham and Hitchin.

The natural sources of the attars or essential oils are the different parts of the plants which yield them—the wood (lign, aloe, santal, cedar), the bark (cinnamon, cascarilla), the leaves (patchouli, bay, thyme), the flowers (rose, lavender, orange-blossom), the fruit (nutmeg, citron), or the seeds (caraway, almond). Some plants yield more than one, such as lemon and bergamot. They are mostly obtained by distilling that part of the plant in which they are contained with water, or with high-pressure or superheated steam; but some few, as those from the rind of bergamot (from *Citrus bergamia*), lemon (citron zeste, from *C. Limonum*), lime (*C. Limetta*), by "expression." The outer layer of the cortex is rasped off from the unripe fruits, the raspings placed in a canvas bag, and squeezed in a screw or hydraulic press. The attars so obtained are separated from the admixed water by a tap-funnel, and are then filtered. Certain flowers, such as jasmine, tuberose, violet, cassia, either do not yield their attars by distillation at all, or do it so sparingly as not to admit of its collection for commercial purposes; and sometimes the attar, as in the case of orange (neroli), has an odour quite different from that of the fresh blossoms. In these cases the odours are secured by the processes of inflowering (enfleurage) or by maceration. Both depend upon the remarkable property which fats and oils possess of absorbing odours. Enfleurage consists in laying the leaves or flowers on plates covered with a layer of fat. The flowers are renewed every morning, and when the fat has sufficient odour it is scraped off, melted and strained. Maceration consists in soaking the flowers in heated fat; in due time they are strained off and replaced by fresh ones, as in the enfleurage process. The whole of the necessary meltings and heatings of the perfumed greases are effected by means of water-baths, whereby the temperature is kept from rising too high. For the manufacture of perfumes for the handkerchief the greases now known as pomades, butters or philocomes are treated with rectified spirit of wine 60° over-proof, *i.e.* containing as much as 95 % of absolute alcohol by volume, which practically completely abstracts the odour.

The gum-resins and resins have been employed as perfumes from the earliest times. The more important are incense, frankincense and myrrh (*q.v.*). They are largely used in the manufacture of perfumes, both for burning as pastilles, ribbon of Bruges, incenses, &c., and in tinctures, to which they impart their characteristic odours, affording, at the same time, a certain fixity to other perfumes of a more fleeting nature when mixed with them.

Synthetic Perfumes.—Under this heading are included all perfumes in which artificial substances are odorous ingredients. Although the earliest perfumes of this class were introduced in about the middle of the 19th century, the important industry which now prevails is to be regarded as dating from the 'seventies and 'eighties. Three main lines of development may be distinguished: (1) the chance discovery of substances which have odours similar to natural perfumes; (2) the elucidation of the composition of the natural scents, and the chemical constitution of their ingredients, followed by the synthetic preparation of the substances so determined; and (3), which may be regarded as connected with (2), the extraction and separation of the essential oils yielded by less valuable plants, and their reblending to form marketable perfumes.

The first synthetic perfume was the "essence of Mirbane" introduced by Collas in about 1850; this substance was the nitro-benzene discovered by E. Mitscherlich in 1834. Soon afterwards many esters of the fatty acids simulating the odours of fruits were introduced; and in 1888 Baur discovered the "artificial musks," which are derivatives of *s*-trinitrobenzene. The above are instances of the first line of progress. The second line has for early examples the cases of artificial oil of wintergreen, which followed Cahour's discovery that the natural oil owed its odour, in the main, to methyl salicylate, and of artificial oil of bitter almonds which followed the preparation of benzaldehyde from benzal chloride in 1868. The synthesis of coumarin, the odorous principle of hay and woodruff, by Sir W. H. Perkin in 1868; of vanillin, the odorous principle of vanilla, by F. Tiemann and W. Haarmann in 1875; and of ionone, almost identical with the natural irone, the odorous principle of violets, by Tiemann and P. Krüger in 1898, are to be regarded as of the highest importance. Equally important are the immense strides made in the elucidation of the constitution and syntheses of the terpenes (*q.v.*), a group of compounds which are exceptionally abundant as odorous principles in the essential oils.

The present state of our knowledge does not permit a strict correlation of odour and chemical constitution. One theory regards odour as due to "osmophores," or odour-producing groups, in much the same way as colour is associated with chromophores. Such osmophores are hydroxyl (OH), aldehyde (CHO), ketone (CO), ether (·O·), nitrile (CN), nitro (NO_2), &c.; we may also notice the isonitrile group (·NC) associated with an unpleasant odour, and the iso-thiocyanate group (·NCS) to which the mustard oils owe their characteristic smell. The same group, however, is not invariably associated with the same odour, or even any odour at all, as, for instance, in such closely related

compounds as the members of a homologous series. For example, the lower fatty aldehydes have unpleasant odours, those with ten carbon atoms (and also double linkages, which in itself may affect odour) form some of the most delicate scents, while the higher members are odourless. The absence of odour in the higher members may be possibly associated with the low volatility exhibited by compounds of high molecular weight. Certain osmophores have practically equal effects; for example, benzaldehyde, nitrobenzene, benzonitrile, and phenyl azoimide have practically identical odours, and among the "artificial musks," a nitro group may be replaced by the azoimido group without the odour being modified. As a general rule, homologues have similar odours, but many exceptions are known. For example the methyl and ethyl ethers of β-naphthol have the odour of neroli; on the other hand, of the esters of anthranilic acid, the methyl has the odour of orange blossoms, the ethyl has a slight odour, and the isobutyl is odourless. The introduction of a methyl group into the benzene ring generally involves little or no change in odour; but when it (and more especially higher alkyl radicals) is introduced into side chains the odour may be entirely changed. For example, benzene and its homologues have similar odours; phthalide is odourless, but the isopropyl and butyl phthalides, in which substitution occurs in the side chain, smell of celery. Especially characteristic are the derivatives of phenylacetylene. This hydrocarbon is distinctly unpleasant; on the other hand, para-ethyl and para-methyl phenylacetylene smell of anise. While the triply-linked carbon system is generally associated with strong and unpleasant odours, the doubly linked system gives pleasant ones. Thus the unpleasant phenylacetylene, $C_6H_5\cdot C:CH$, is contrasted with styrolene, $C_6H_5\cdot CH:CH_2$, which occurs in storax, and phenylpropiolic aldehyde with cinnamic aldehyde, $C_6H_5\cdot CH:CH\cdot CHO$, which occurs in cassia and cinnamon. The reduction of a double to a single linkage may not destroy odour. Thus hydrocinnamic aldehyde, the reduction product of cinnamic aldehyde, smells of jasmine and lilac, and melilotin, which occurs in yellow melilot (*Melilotus officinalis*), has the same odour (woodruff) as its oxidation product coumarin. The orientation of the substituent groups in the benzene nucleus also affects odour. In general, the meta compounds are odourless, while the ortho and para may have odour. Thus *p*-methoxyacetophenone has a pleasant odour, the meta compound is odourless, *o*-aminoacetophenone, *o*-aminobenzaldehyde, and *o*-nitrophenol have strong odours, while the meta and para bodies are odourless. Of the three trinitrobenzenes only the symmetrical form gives origin to perfumes.

The concentration and even the solvent has considerable effect on the odour of a substance. Many of the artificial principles—vanillin, heliotropine, ionone, &c.—have very different odours in strong and in dilute solution; phenyl acetic acid and β-naphthylamine are odourless when solid, but have disagreeable odours when dissolved. Traces of impurities often have the effect of making odourless or pleasant-smelling compounds quite intolerable. Acetylene as generated from calcium carbide, and carbon disulphide prepared from its elements are quite intolerable, though when pure they are, at least, not unpleasant; artificial benzaldehyde must be very carefully purified before it can be used in the preparation of the more delicate scents. In all cases the natural scents are complex mixtures of many ingredients, and a variation in the amount of any one may completely alter the scent. Such mixtures would be difficult to reproduce economically; the perfumer is content with a product having practically an identical odour, with or without the natural substance which it is designed to compete with.

We now give an account of the artificial scents, principally arranged according to their chemical relations. The *fatty esters* are interesting as providing many of the fruit essences; in fact, by appropriate blending, any fruit odour can be reproduced. Their use, however, is inhibited by the fact that they irritate the respiratory organs, producing coughing and headaches. Isobutyl carbinol acetic ester (amyl acetate), $(CH_3)_2\cdot CH\cdot CH_2\cdot CH_2\cdot OC\cdot CH_3$, forms when in dilute alcoholic solution the artificial pear oil; a similar odour is possessed by isoamyl-*n*-butyrate, $C_3H_7\cdot CO_2\cdot C_5H_{11}$. *n*-Octyl acetate, $C_8H_{17}\cdot O_2C\cdot CH_3$, has the odour of oranges. Isoamyl propionate, $C_5H_{11}\cdot O_2C\cdot C_2H_5$, and ethyl-*n*-butyrate, $C_3H_7\cdot O_2C\cdot C_2H_5$, have the odour of pineapple, the latter constituting the artificial pineapple oil of commerce. Isoamyl isovalerate, $C_5H_{11}\cdot O_2C\cdot C_4H_9$, is the artificial apple oil. Of the fatty ketones, methyl nonyl ketone, $CH_3\cdot CO\cdot C_9H_{19}$, which is the scent of oil of rue, and methyl-ethyl acetone, $CH_3\cdot CO\cdot CH(CH_3)(C_2H_5)$, which has the odour of peppermint, receive commercial application. Of exceptional importance in the chemistry of perfumes are the unsaturated open chain compounds containing at least eight carbon atoms. These are chemically considered, along with the related cyclic compounds, in the article TERPENES; here we notice their odours and occurrence in perfumes. Of the alcohols, *l*-linalol occurs in oil of lavender, bergamot, limet and origanum; *d*-linalol in coriander; citronellol and geraniol in rose, geranium and pelargonium oils. Of the aldehydes, citral or geranial has the odour of lemons; citronellal is the chief constituent of citronella oil. By condensing citral with acetone and treating the product with dilute sulphuric acid, the valuable violet substitute *ionone* results. This substance is a hydroaromatic ketone, and closely resembles the natural principle irone. By successive treatment with acetic anhydride (to form isopulegol), oxidation to isopulegone, and treatment with baryta citronellal yields the cyclic compound *pulegone*, the chief constituent of oil of pennyroyal. The olefinic terpenes are generally convertible into methyl heptenone, $(CH_3)_2C:CH(CH_2)_2\cdot CO\cdot CH_3$, which has been synthesized from sodium acetonylacetone and amylene dibromide; this ketone occurs in several essential oils, and has the odour of rue. For the occurrence of cyclic terpenes in the essential oils reference should be made to the table below, which contains the names, sources and chief ingredients of the more important essential oils.[1] The terpenes are printed in italics, the aliphatic and benzenoid compounds in ordinary type.

Name of Oil.	Source.	Constituents.
Anise . .	*Pimpinella anisum*	Anethole, estragole.
Bay . . .	*Pimenta acris*	Eugenol, methyl eugenol, chavicol, estragole, *myrcene*, *phellandrene*.
Bergamot .	*Citrus bergamia*	*Linalol*, *linalyl acetate*, d-*limonene*, *bergaptene*.
Cajaput. .	*Melaleuca*, sp.	*Cineol*.
Cassia . .	*Cinnamonum cassia*	Cinnamic aldehyde, cinnamyl acetate.
Caraway .	*Carum carvi*	*Carvone*, d-*limonene*.
Camphor .	*Cinnamonum camphor*	d-*Pinene*, *phellandrene*, *terpineol*, eugenol, safrole.
Chamomile .	*Anthemis nobilis*	Isobutyl and isoamyl esters of angelic and tiglic acids.
Cinnamon .	*Cinnamonum Zeylanicum*	Cinnamic aldehyde.
Clove . .	*Eugenia caryophyllata*	Eugenol.
Coriander .	*Coriandum sativum*	*Linalol*.
Cumin . .	*Cuminum cymium*	Cumic aldehyde, cymene.
Eucalyptus .	*Eucalyptus globulus*	*Cineol*, d-*pinene*, and fatty aldehydes.
Fennel . .	*Foeniculum vulgare*	Anethole, *fenchone*, d-*pinene*.
Geranium .	*Andropogon schoenanthus*	*Geraniol*, *citronellol*.
Jasmine .	*Jasminum grandiflorum*	Methyl anthranilate, indol, benzyl alcohol, benzyl acetate, *linalol*, *linalyl acetate*.
Lavender .	*Lavendula vera*	*Linalol*, l-*linalyl acetate*.
Lemon . .	*Citrus limonum*	*Limonene*, *phellandrene*, *citral*, *citronellal*, *geranyl acetate*, *linalol*.
Lemon-grass	*Andropogon citra*	*Citral*.
Neroli .	*Citrus bigardia*	l-*Linalol*, *geraniol*, *limonene*, methyl anthranilate.
Orange .	*Citrus aurantium*	d-*Limonene*.
Peppermint	*Mentha piperita*	*Menthol*, *menthyl acetate* and *valerate*.
Pine-needle	*Pinus sylvestris*	d-*Pinene*, d-*sylvestrene*.
Rose . .	*Rosa damascena*	*Geraniol*, l-*citronellol*.
Rose Geranium	*Pelargonium odoratissemum*	*Geraniol*, *citronellol*.
Rosemary .	*Rosamarinus officinalis*	*Pinene*, *camphene*, *camphor*, *cineol*, *borneol*.
Sage . . .	*Salvia officinalis*	*Pinene*, *cineol*, *thujone*, *borneol*.
Sassafras .	*Sassafras officinalis*	Safrole.
Spearmint .	*Mentha viridis*	l-*Linalol*, l-*carvone*.
Star anise .	*Illicium anisatum*	Anethole.
Tansy . .	*Tanacetum vulgare*	*Thujone*.
Thyme .	*Thymus vulgaris*	Thymol.
Wormwood .	*Artemisia absinthum*	*Thujone* and *thujyl esters*.
Ylang-ylang	*Cananga odorata*	l-*Linalol*, *geraniol*.

[1] See J. B. Cohen, *Organic Chemistry*, p. 532; or J. Parry, *Chemistry of Perfumes* (1908).

The chief benzenoid compounds used as perfumes are aldehydes, oxyaldehydes, phenols and phenol ethers. Benzaldehyde has the odour of almonds, cinnamic aldehyde of cinnamon, and cumin aldehyde gives the odour to cumin oil. Of oxyaldehydes salicylaldehyde gives the odour to spiraea oil, and vanillin is the active ingredient of vanilla (*q.v.*). Anisaldehyde smells like hawthorn, and is extensively used under the name anhépine for scenting soaps and extracts. Carvacrol and thymol are isomeric methyl propyl phenols; both have the odour of thyme. Of phenol ethers eugenol (allyl guaiacol) has the odour of cloves, and anethole (allyl phenyl methyl ether) is the chief constituent of anise oil, being chiefly used in the manufacture of liqueurs. Several piperonyl compounds are of commercial importance. The aldehyde. $CH_2[O]_2{:}C_6H_3{\cdot}CHO(1,2,4)$, piperonal, has the odour of heliotrope; an allyl derivative, safrole $CH_2[O]_2{:}C_6H_3{\cdot}C_3H_5(1,2,4)$, occurs in sassafras, while apiole or dimethoxy safrole has the odour of parsley oil. Of other synthetic perfumes amyl salicylate is used under the names of *orchidée* or *trefol* as the basis of many perfumes, in particular of clover scents; methyl anthranilate occurs in the natural neroli and other oils, and has come into considerable use in the preparation of artificial bergamot, neroli, jasmine and other perfumes (the Trolene, Marceol and Amanthol of the *Actien Gesellschaft für Anilin Fabrikation* have this substance as a base); the "artificial musks" are derivatives of *s*-trinitrobenzene; coumarin is the principle of woodruff; and β-naphthol methyl ether is used for the preparation of artificial neroli.

The Odophone.—The most important element in the perfumer's art is the blending of the odorous principles to form a mixture which gratifies the sense of smell. Experience is the only guide. It is impossible to foretell the odour of a mixture from the odours of its components. Septimus Piesse endeavoured to show that a certain scale or gamut existed amongst odours as amongst sounds, taking the sharp smells to correspond with high notes and the heavy smells with low. He illustrated the idea by classifying some fifty odours in this manner, making each to correspond with a certain note, one-half in each clef, and extending above and below the lines. For example, treble clef note E (4th space) corresponds with Portugal (orange), note D (1st space below clef) with violet, note F (4th space above clef) with ambergris. It is readily noticed in practice that ambergris is much sharper in smell (higher) than violet, while Portugal is intermediate. He asserted that properly to constitute a bouquet the odours to be taken should correspond in the gamut like the notes of a musical chord—one false note among the odours as among the music destroying the harmony. Thus on his odophone, santal, geranium, acacia, orange-flower, camphor, corresponding with C (bass 2nd line below), C (bass 2nd space), E (treble 1st line), G (treble 2nd line), C (treble 3rd space), constitute the bouquet of chord C.

Other Branches of Perfumery.—As a natural outcome of the development of the perfume industry, scented articles for toilet and other uses are now manufactured in large quantities. Soaps, toilet powders, tooth powders, hair-washes, cosmetics generally, and note-paper have provided material on which the perfumer works. For the preparation of *scented soaps* two methods are in use; both start with a basis either of fine yellow soap (which owes its odour and colour to the presence of resin), or of curd soap (which is hard, white and odourless, and is prepared without resin). In one process the soap is melted by superheated steam, and while still hot and semi-fluid mixed by means of a stirrer of wood with iron cross-bar, technically called a "crutch," with the attars and colouring matter. It is then removed from the melting pan to a rectangular iron mould or box, the sides of which can be removed by unscrewing the tie-rods which hold them in position; when cold the mass is cut into slabs and bars with a thin brass wire. In the other or cold process the soap is first cut into chips or shavings by a plane or "chipping machine," then the colouring matters are added and thoroughly incorporated by passing the soap between rollers; the tinted soap emerges in a continuous sheet but little thicker than paper. The perfumes are then added, and after standing for about twelve hours the soap is again sent through the rolling machine. It is next transferred to a bar-forming machine, from which it emerges in a continuous bar almost as hard as wood. Soap thus worked contains less than 10 % of water; that prepared by melting contains 20 and even 30 %. The amount of perfume added depends upon its nature, and amounts usually to about 7 or 8 %. The finest soaps are always manufactured by the cold process.

Toilet Powders are of various sorts. They consist of rice-starch or wheat-starch, with powdered orris-root in varying proportions, and with or without the addition of zinc oxide, bismuth oxide or French chalk. The constituent powders, after the addition of the perfume, are thoroughly incorporated and mixed by sifting through a fine sieve. Violet powder for the nursery should consist entirely of powdered violet root (*Iris florentina*), from the odour of which the powder is named. It is of a yellowish tint, soft and pleasant to the touch. The white common so-called "violet powders" consist of starch scented with bergamot, and are in every sense inferior.

Tooth Powders consist for the most part of mixtures of powdered orris-root with precipitated chalk, and some other constituent destined to particularize it as to properties or flavour, such as charcoal, finely pulverized pumice, quassia, sugar, camphor, &c. The perfume of the contained orris-root is modified, if required, by the addition of a little of some perfume. *Tooth Pastes* are formed of the same constituents as the powders, and are worked into a paste by the addition of a little honey or glucose syrup, which substances are usually believed ultimately to have an injurious effect on the teeth.

Perfume Sachets consist either of a powder composed of a mixture of vanilla, musk, Tonqua beans, &c., one or other predominating as required, contained in an ornamental silk sac; or of some of the foregoing substances spread upon card or chamois leather or flannel after being made into a paste with mucilage and a little glycerin. When dry the card so prepared is daintily covered with various parti-coloured silks for sale. Where the ingredients employed in their manufacture are of good quality these cards, known as "peau d'Espagne" sachets, retain their odour unimpaired for years.

Adulterations.—There is, as might be expected, considerable scope for the adulteration of the "matières premières" employed in perfumery. Thus, in the case of musk, the "pods" are frequently found to be partially emptied of the grain, which has been replaced by hide or skin, while the weight has been increased by the introduction of lead, &c. In other instances the fraud consists in the admixture of refuse grain, from which the odour has been exhausted with spirit, with dried blood, and similar substances, whilst pungency is secured by the addition of ammonium carbonate. Attar of rose is diluted with attar of *Palma rosa*, a variety of geranium of only a quarter or a fifth of the value. The main adulterant of all the natural essential oils, however, is castor oil. This is a bland neutral body, practically odourless, and completely soluble in alcohol; it therefore presents all the requisites for the purpose.

PERGA (mod. *Murtana*), an ancient city of Pamphylia, situated about 8 m. inland, at the junction of a small stream (Sari Su) with the Cestrus. It was a centre of native influences as contrasted with the Greek, which were predominant in Attalia, and it was a great seat of the worship of "Queen" Artemis, here represented as a human-headed cone and a purely Anatolian nature goddess. There Paul and Barnabas began their first mission in Asia Minor (Acts ix. 13). A much frequented route into Phrygia and the Maeander valley began at Perga, and Alexander made it the starting-point of his invasion of inner Asia Minor. Long the metropolis of Pamphylia Secunda, it was superseded in Byzantine times by its port, Attalia, which became a metropolis in 1084. The extensive ruins all lie in the plain south of the Acropolis. The walls are well preserved, but of late Roman or Byzantine reconstruction. The lines of intersecting streets can be easily made out, and there are ruins of two sets of baths, two basilicas and a forum. But the most notable monument is the theatre, which lies outside the walls on the south-west, near the stadium. This is as perfect as those of Myra and Patara, but larger than either, and yields the palm only to those of Aspendus and Side. Modern Murtana is a large village, long under the dominion of the Dere Beys of the Tekke Oglu family.

PERGAMENEOUS (Lat. *pergamena*, parchment), a technical term used of anything of the texture of parchment, as in zoology of the wing-covers of insects.

PERGAMUM, or Pergamus (mod. *Bergama*), an ancient city of Teuthrania, a district in Mysia. It is usually named Πέργαμον by Greek writers, but Ptolemy has the form Πέργαμος. The name, which is related to the German *burg*, is appropriate to the situation on a lofty isolated hill in a broad fertile valley, less than 15 m. from the mouth of the Caicus. According to the belief of its inhabitants, the town was founded by Arcadian colonists, led by Telephus, son of Heracles. Auge, mother of

Telephus, was priestess of Athena Alea at Tegea, and daughter of Aleus; fleeing from Tegea, she became the wife of Teuthras, the eponymous king of Teuthrania, and her son Telephus succeeded him. Athena Polias was the patron-goddess of Pergamum, and the legend combines the ethnological record of the connexion claimed between Arcadia and Pergamum with the usual belief that the hero of the city was son of its guardian deity, or at least of her priestess. Nothing more is recorded of the city till the time of Xenophon, when it was a small fortified town on the summit of the hill; but it had been striking coins since 420 B.C. at latest. Its importance began under Lysimachus, who deposited his treasures, 9000 talents, in this strong fortress under the charge of a eunuch, Philetaerus of Tium. In 283 B.C. Philetaerus rebelled, Lysimachus died without being able to put down the revolt, and Pergamum became the capital of a little principality. Partly by clever diplomacy, partly through the troubles caused by the Gaulish invasion and by the dissensions among the rival kings, Philetaerus contrived to keep on good terms with his neighbours on all sides (283–263 B.C). His nephew Eumenes (263–241) succeeded him, increased his power, and even defeated Antiochus II. of Syria in a pitched battle near Sardis. His successor Attalus I. (241–197) won a great battle over the Gauls, and assumed the title of king. The other Greek kings who aimed at power in Asia Minor were his natural enemies, and about 222 reduced Pergamenian power to a very low ebb. On the other hand, the influence of the Romans was beginning to make itself felt in the East. Attalus prudently connected himself with them and shared in their continuous success. Pergamum thus became the capital of a considerable territory and a centre of art and regal magnificence. The wealth of the state and the king's desire to celebrate his victories by monuments of art led to the rise of the "Pergamenian school" in sculpture. The splendour of Pergamum was at its height under Eumenes II. (197–159). He continued true to the Romans during their wars with Antiochus and Perseus, and his kingdom spread over the greater part of western Asia Minor, including Mysia, Lydia, great part of Phrygia, Ionia and Caria. To celebrate the great achievement of his reign, the defeat of the barbarian Gauls, he built in the agora a vast altar to Zeus Soter (see below). He left an infant son, Attalus (III.), and a brother, Attalus II. (Philadelphus), who ruled 159–138, and was succeeded by his nephew, Attalus III. (Philometor). The latter died in 133, and bequeathed his kingdom to the Romans, who erected part of it (excluding Great Phrygia, which they gave to Mithradates of Pontus) into a province under the name of Asia. Pergamum continued to rank for two centuries as the capital, and subsequently, with Ephesus and Smyrna, as one of the three great cities of the province; and the devotion of its former kings to the Roman cause was continued by its citizens, who erected on the acropolis a magnificent temple to Augustus. It was the seat of a *conventus*, including the cities of the Caïcus valley and some of those in the northern part of the Hermus valley. Under the Roman Empire Pergamum was one of the chief seats of the worship of Asclepius "the Saviour"; invalids came from distant parts of the country to ask advice from the god and his priests. The temple and the curative establishment of the god were situated outside the city. Pergamum was the chief centre of the imperial cult under the early empire, and, in W. M. Ramsay's opinion, was for that reason referred to in Rev. ii. 13 as the place of "Satan's throne." It was also an early seat of Christianity, and one of the Seven Churches. The place, re-fortified by the Byzantines, and still retaining its name as Bergama, passed into Moslem hands early in the 14th century. The lower town was rebuilt, and in the 17th and 18th centuries became a chief seat of the great Dere Bey family of Kara Osman Oglu (see MANISA), which did not resign it to direct Ottoman control until about 1825. It is still an administrative and commercial centre of importance, having some 20,000 inhabitants.

Excavations.—The site of the ancient city has been the scene of extensive excavations promoted by the Berlin museum since 1878, and directed first by K. Humann and A. Conze, and afterwards by W. Dörpfeld. The first impulse to them was given in 1873 by the reception in Berlin of certain reliefs, extracted by Humann from the walls of Bergama. These were recognized as probably parts of the Great Altar of Zeus erected by Eumenes II. in 180 B.C. and decorated with a combat of gods and giants, symbolic of the struggle between the Pergamene Greeks and the Gaulish barbarians. Excavation at the south end of the Acropolis led to the discovery of the Altar itself and the rest of its surviving reliefs, which, now restored and mounted in Berlin, form one of the glories of that city. In very high relief and representing furious action, these sculptures are the finest which survive from the Pergamene school, which replaced the repose and breadth of earlier schools by excess of emphasis and detail. The summit of the Acropolis is crowded with public buildings, between the market-place, which lies at the southern point, and the Royal Gardens on the north. In the interval are the Zeus altar; the great hexastyle Doric temple of Athena flanked by the palace on the east, by the theatre and its long terrace on the west, and by a library on the north; and a large Corinthian temple of Trajan. The residential part of the Greek, and practically all the Roman city lay below the Acropolis on ground now mostly occupied by modern Bergama; but west of the river Selinus, on rising ground facing the Acropolis, are to be seen notable remains of a Roman theatre, an amphitheatre and a circus.

See, beside general authorities for Asia Minor, J. Dallaway, *Constantinople*, &c. (1797); W. M. Ramsay, *Letters to the Seven Churches* (1904); and especially the publication by the Royal Museum of Berlin, *Alterthümer von Pergamon* (1885 sqq.); "Operations at Pergamon, 1906–1907," in *Athenische Mitteil.* (1908) xxxiii. 4; G. PERGOLA (Lat. *pergula*, a projecting roof, shed, from *pergere*, to reach forward, project), a term adopted from the Italian for an arbour of trellis-work over which are trained creeping plants, vines, &c., and especially for a trellis-work covering a path, walk or balcony in a garden.

PERGOLESI (or PERGOLESE), **GIOVANNI BATTISTA** (1710–1736), Italian musical composer, was born at Jesi near Ancona on the 3rd of January 1710, and after studying music under local masters until he was sixteen was sent by a noble patron to complete his education at Naples, where he became a pupil of Greco, Durante and Feo for composition and of Domenico de Matteis for the violin. His earliest known composition was a sacred drama, *La Conversione di S. Guglielmo d'Aquitania*, between the acts of which was given the comic intermezzo *Il Maestro di musica*. These works were performed in 1731, probably by fellow-pupils, at the monastery of St Agnello Maggiore. Through the influence of the prince of Stigliano and other patrons, including the duke of Maddaloni, Pergolesi was commissioned to write an opera for the court theatre, and in the winter of 1731 successfully produced *La Sallustia*, followed in 1732 by *Ricimero*, which was a failure. Both operas had comic intermezzi, but in neither case were they successful. After this disappointment he abandoned the theatre for a time and wrote thirty sonatas for two violins and bass for the prince of Stigliano. He was also invited to compose a mass on the occasion of the earthquake of 1731, and a second mass, also for two choirs and orchestra, is said to have been praised by Leo. In September 1732 he returned to the stage with a comic opera in Neapolitan dialect, *Lo Frate inammorato*, which was well received; and in 1733 he produced a serious opera, *Il Prigionier*, to which the celebrated *Serva padrona* furnished the intermezzi. There seems, however, no ground for supposing that this work made any noticeable difference to the composer's already established reputation as a writer of comic opera. About this time (1733–1734) Pergolesi entered the service of the duke of Maddaloni, and accompanied him to Rome, where he conducted a mass for five voices and orchestra in the church of St Lorenzo in Lucina (May 1734). There is no foundation for the statement that he was appointed maestro di cappella at the Holy House of Loreto; he was, in fact, organist of the royal chapel at Naples in 1735. The complete failure of *L'Olimpiade* at Rome in January 1735

is said to have broken his health, and determined him to abandon the theatre for the Church; this statement is, however, incompatible with the fact that his comic opera *Il Flaminio* was produced in Naples in September of the same year with undoubted success. His ill health was more probably due to his notorious profligacy. In 1736 he was sent by the duke of Maddaloni to the Capuchin monastery at Pozzuoli, the air of the place being considered beneficial to cases of consumption. Here he is commonly supposed to have written the celebrated *Stabat Mater*; Paisiello, however, stated that this work was written soon after he left the *Conservatorio dei poveri di Gesù Cristo* in 1729. We may at any rate safely attribute to this period the *Scherzo fatto ai Cappuccini di Pozzuoli*, a musical jest of a somewhat indecent nature. He died on the 17th of March 1736, and was buried in the cathedral of Pozzuoli.

Pergolesi's posthumous reputation has been exaggerated beyond all reason. This was due partly to his early death, and largely to the success of *La Serva padrona* when performed by the *Bouffons Italiens* at Paris in 1752. Charming as this little piece undoubtedly is, it is inferior both for music and for humour to Pergolesi's three-act comic operas in dialect, which are remembered now only by the air "Ogni pena più spietata" from *Lo Frate inammorato.* As a composer of sacred music Pergolesi is effective, but essentially commonplace and superficial, and the frivolous style of the *Stabat Mater* was rightly censured by Paisiello and Padre Martini. His best quality is a certain sentimental charm, which is very conspicuous in the cantata *L'Orfeo* and in the genuinely beautiful duets "Se cerca, se dice" and "Ne' giorni tuoi felici" of the serious opera *L'Olimpiade*; the latter number was transferred unaltered from his early sacred drama *S. Guglielmo*, and we can thus see that his natural talent underwent hardly any development during the five years of his musical activity. On the whole, however, Pergolesi is in no way superior to his contemporaries of the same school, and it is purely accidental that a later age should have regarded him as its greatest representative.

Bibliography.—The most complete life of Pergolesi is that by E. Faustini Fasini (*Gazzetta musicale di Milano*, 31st of August 1899, &c., published by Ricordi in book form, 1900); G. Annibaldi's *Il Pergolesi in Pozzuoli, vita intima* (Jesi, 1890) gives some interesting additional details derived from documents at Jesi, but is cast in the form of a romantic novel. H. M. Schletterer's lecture in the *Sammlung musikalischer Vorträge*, edited by Count P. von Waldersee, is generally inaccurate and uncritical, but gives a good account of later performances of Pergolesi's works in Italy and elsewhere. Various portraits are reproduced in the *Gazz. mus. di Milano* for the 14th of December 1899, and in *Musica e musicisti*, December 1905. Complete lists of his compositions are given in Eitner's *Quellen-Lexicon* and in Grove's *Dictionary* (new ed.). (E. J. D.)

PERGOLESI, MICHAEL ANGELO, an 18th-century Italian decorative artist, who worked chiefly in England. Biographical details are almost entirely lacking, but like Cipriani he was brought, or attracted, to England by Robert Adam after his famous continental tour. He worked so extensively for the Adams, and his designs are so closely typical of much upon which their reputation rests, that it is impossible to doubt his influence upon their style. His range, like theirs, was catholic. He designed furniture, mantelpieces, ceilings, chandeliers, doors and mural ornament with equal felicity, and as an artist in plaster work in low relief he was unapproached in his day. He delighted in urns and sphinxes and interlaced gryphons, in *amorini* with bows and torches, in trophies of musical instruments and martial weapons, and in flowering arabesques which were always graceful if sometimes rather thin. The centre panels of his walls and ceilings were often occupied by classical and pastoral subjects painted by Cipriani, Angelica Kauffmann, Antonio Zucchi, her husband, and sometimes by himself. These nymphs and amorini, with their disengaged and *riant* air and classic grace, were not infrequently used as copies for painting upon that satinwood furniture of the last quarter of the 18th century which has never been surpassed for dainty elegance, and for the popularity of which Pergolesi was in large measure responsible; they were even reproduced in marquetry. Some of this painted work was, apparently, executed by his own hand; most of the pieces attributed to him are remarkable examples of artistic taste and technical skill. His satin-wood table-tops, China cabinets and side-tables are the last word in a daintiness which here and there perhaps is mere prettiness. Pergolesi likewise designed silver plate, and many of his patterns are almost instinctively attributed to the brothers Adam by the makers and purchasers of modern reproductions. There is, moreover, reason to believe that he aided the Adam firm in purely architectural work. In later life Pergolesi appears, like Angelica Kauffmann, to have returned to Italy.

Our chief source of information upon his works is his own publication, *Designs for Various Ornaments on Seventy Plates*, a series of folio sheets, without text, published between 1777 and 1801.

PERI, JACOPO (1561–16 ?), Italian musical composer, was born at Florence on the 20th of August 1561, of a noble family. After studying under Cristoforo Malvezzi of Lucca, he became maestro di cappella, first to Ferdinand, duke of Tuscany, and later to Cosmo II. He was an important member of the literary and artistic circle which frequented the house of Giovanni Bardi, conte de Vernio, where the revival of Greek tragedy with its appropriate musical declamation was a favourite subject of discussion. With this end in view the poet Ottavio Rinuccini supplied a drama with the title of *Dafne*, to which Peri composed music, and this first attempt at opera was performed privately in 1597 in the Palazzo Corsi at Florence. This work was so much admired that in 1600 Rinuccini and Peri were commissioned to produce an opera on the occasion of the marriage of Henry IV. of France with Maria di' Medici. This work (*L'Euridice*) attracted a great deal of attention, and the type once publicly established, the musical drama was set on the road to success by the efforts of other composers and the patronage of other courts. Peri himself seems never to have followed up his success with other operas; he became maestro di cappella to the duke of Ferrara in 1601, but after the publication of his *Varie musiche a una, due e tre voci* at Florence in 1609, nothing more is known of him.

Peri's *Dafne* (which has entirely disappeared) and *Euridice* (printed at Florence 1600; reprinted Venice 1608 and Florence 1863) are of the greatest importance not only as being the earliest attempts at opera, but as representing the new monodic and declamatory style which is the basis of modern music as opposed to the contrapuntal methods of Palestrina and his contemporaries. Peri's work is of course primitive in the extreme, but it is by no means without beauty, and there are many scenes in *Euridice* which show a considerable dramatic power.

PERIANDER (Gr. Περίανδρος), the second tyrant of Corinth (625–585 B.C.). In contrast with his father Cypselus, the founder of the dynasty, he is generally represented as a cruel despot, or at any rate as having used all possible devices for keeping his city in subjection. Among numerous anecdotes the following is characteristic. Periander, on being consulted by the tyrant Thrasybulus of Miletus as to the best device for maintaining himself in power, by way of reply led the messenger through a cornfield, and as he walked struck off the tallest and best-grown ears (a legend applied to Roman circumstances in Livy i. 54). It seems, however, that the prevalent Greek tradition concerning him was derived from the versions of the Corinthian aristocracy, who had good reasons for giving a prejudiced account, and the conflicting character of the various legends further shows that their historical value is slight. A careful sifting of the available evidence would rather tend to represent Periander as a ruler of unusual probity and insight, and the exceptional firmness and activity of his government is beyond dispute. His home administration was so successful that he was able to dispense with direct taxation. He fostered wealth by the steady encouragement of industry and by drastic legislation against idleness, luxury and vice; and the highest prosperity of the Corinthian handicrafts may be assigned to the period of his rule (see Corinth). At the same time he sought to check excessive accumulation of wealth in individual hands and restricted the influx of population into the town. Employment was found

for the proletariat in the erection of temples and of public works. Periander further appears as a patron of literature, for it was by his invitation that the poet Arion came to Corinth to organize the dithyramb. He devoted no less attention to the increase of Corinthian commerce, which in his days plied busily on both eastern and western seas. With this end in view he established colonies at Potidaea and Apollonia in Macedonia, at Anactorium and Leucas in north-western Greece, and he is said to have projected a canal through the Isthmus. In Greece Proper he conquered Epidaurus, and with the help of his fleet of triremes brought the important trading centre of Corcyra under his control, while his interest in the Olympian festival is perhaps attested by a dedication which may be ascribed to him—the famous "chest of Cypselus." He cultivated friendly relations with the tyrants of Miletus and Mytilene, and maintained a connexion with the kings of Lydia, of Egypt, and, possibly, of Phrygia. In spite of these varied achievements Periander never entirely conciliated his subjects, for he could not trust himself without a bodyguard. Moreover his family life, according to all accounts, was unfortunate. His sons all died or were estranged from him, and the murder of his last remaining child Lycophron, the governor of Corcyra, is said to have broken his spirit and hastened on his death.

Periander was reckoned one of the seven sages of Greece, and was the reputed author of a collection of maxims (Ὑποθῆκαι) in 2000 verses. The letters ascribed to him by Diogenes Laërtius are undoubtedly spurious.

Herodotus iii. 48–53, v. 92; Aristotle, *Politics*, v. 6, 10–12; Heracleides Ponticus in C. Müller's *Frag. hist. graec.* ii. 212; Nicolaus Damascenus, ibid. iii. 393; Diogenes Laërtius, *De vitis clarorum philosophorum*, i. ch. 7. (M. O. B. C.)

PERICLES (490–429 B.C.), Athenian statesman, was born about 490 B.C., the son of Xanthippus and Agariste. His father[1] took a prominent part in Athenian politics, and in 479 held high command in the Greek squadron which annihilated the remnants of Xerxes' fleet at Mycale; through his mother, the niece of Cleisthenes, he was connected with the former tyrants of Sicyon and the family of the Alcmaeonidae. His early training was committed to the ablest and most advanced teachers of the day: Damon instructed him in music, Zeno the Eleatic revealed to him the powers of dialectic; the philosopher Anaxagoras, who lived in close friendship with Pericles, had great influence on his cast of thought and was commonly held responsible for that calm and undaunted attitude of mind which he preserved in the midst of the severest trials.

The first important recorded act of Pericles falls in 463, when he helped to prosecute Cimon on a charge of bribery, after the latter's Thasian campaign; but as the accusation could hardly have been meant seriously Pericles was perhaps put forward only as a lay-figure. Undue prominence has commonly been assigned to him in the attack upon the Areopagus in 462 or 461 (see AREOPAGUS, CIMON). The Aristotelian *Constitution of Athens* shows conclusively that Pericles was not the leader of this campaign, for it expressly attributes the bulk of the reforms to Ephialtes (ch. 25), and mentions Ephialtes and Archestratus as the authors of the laws which the reactionaries of 404 sought to repeal (ch. 35): moreover, it was Ephialtes,[2] n t Pericles, on whom the Conservatives took revenge as the author of their discomfiture. To Ephialtes likewise we must ascribe the renunciation of the Spartan alliance and the new league with Argos and Thessaly (461).

Not long after, however, when Ephialtes fell by the dagger, Pericles undoubtedly assumed the leading position in the state. The beginning of his ascendancy is marked by an unprecedented outward expansion of Athenian power. In continuance of Cimon's policy, 200 ships were sent to support the Egyptian insurgents against Persia (459),[3] while detachments operated against Cyprus and Phoenicia. At the same time Athens embarked on several wars in Greece Proper. An alliance with the Megarians, who were being hard pressed by their neighbours of Corinth, led to enmity with this latter power, and before long Epidaurus and Aegina were drawn into the struggle. On sea the Athenians, after two minor engagements, gained a decisive victory which enabled them to blockade Aegina. On land their general Myronides beat off two Corinthian attacks on Megara, which had been further secured by long walls drawn between the capital and its port Nisaea, nearly a mile distant. In 457 the Athenians and their allies ventured to intercept a Spartan force which was returning home from central Greece. At Tanagra in Boeotia a pitched battle was fought, in which both Pericles and the partisans of Cimon distinguished themselves. The Spartans were successful but did not pursue their advantage, and soon afterwards the Athenians, seizing their opportunity, sallied forth again, and, after a victory under Myronides at Oenophyta, obtained the submission of all Boeotia, save Thebes, and of Phocis and Locris. In 455 Tolmides ravaged Laconia and secured Naupactus on the Corinthian gulf; in 454[4] Pericles himself defeated the Sicyonians, and made a descent upon Oeniadae at the mouth of the gulf, and in 453 conducted a cleruchy to the Thracian Chersonese. These years mark the zenith of Athenian greatness. Yet the drain on the country's strength was severe, and when news arrived in 453 that the whole of the Egyptian armament, together with a reserve fleet, had been destroyed by the Persians, a reaction set in, and Cimon, who was recalled on Pericles' motion (but see CIMON), was empowered to make peace with Sparta on the basis of the *status quo*. For a while the old anti-Persian policy again found favour in Athens, and Cimon led a great expedition against Cyprus; but on Cimon's death hostilities were suspended, and a lasting arrangement with Persia was brought about.[5] It was probably in order to mark the definite conclusion of the Persian War and to obtain recognition for Athens' work in punishing the Mede that Pericles now[6] proposed a pan-Hellenic congress at Athens to consult about the rebuilding of the ruined temples and the policing of the seas; but owing to the refusal of Sparta the project fell through.

Pericles may now have hoped to resume his aggressive policy in Greece Proper, but the events of the following years completely disillusioned him. In 447 an Athenian army, which had marched into Boeotia to quell an insurrection, had to surrender in a body at Coronea, and the price of their ransom was the evacuation of Boeotia. Upon news of this disaster Phocis, Locris and Euboea revolted, and the Megarians massacred their Athenian garrison, while a Spartan army penetrated into Attica as far as Eleusis. In this crisis Pericles induced the Spartan leaders to retreat, apparently by means of a bribe, and hastened to reconquer Euboea; but the other land possessions could not be recovered, and in a thirty years' truce which was arranged in 445 Athens definitely renounced her predominance in Greece Proper. Pericles' foreign policy henceforward underwent a profound change—to consolidate the naval supremacy, or to extend it by a cautious advance, remained his only ambition.

[1] He must have been born before 485–484, in which years his father was ostracized. On the other hand, Plutarch describes him as *νέος ὤν*, *i.e.* not yet 30, in 463.

[2] The later eminence of Pericles has probably misled historians into exaggerating his influence at this time. Even the *Const. Ath.* (ch. 27) says that Pericles took "some" prerogatives from the Areopagus; this looks like a conjecture based on Arist. Pol. ii. 9 (12), 1273; *τὴν ἐν Ἀρείῳ πάγῳ βουλὴν Ἐφιάλτης ἐκόλουσε καὶ Περικλῆς*, a passage which really proves nothing. Plutarch, who is clearly blinded by Pericles' subsequent brilliance, makes him suddenly burst into prominence and hold the highest place for 40 years (*i.e.* from 469); he degrades Ephialtes into a tool of Pericles.

[3] The chronology of these years down to 449 is not quite certain.

[4] An abortive expedition to reinstate a Thessalian prince probably also belongs to this year; there is also evidence that Athens interfered in a war between Selinus and Segesta in Sicily about this time.

[5] The "peace of Callias" is perhaps a fiction of the 4th century orators. All the earlier evidence goes to show that only an informal understanding was arrived at, based on the *de facto* inability of either power to cripple the other (see CIMON).

[6] 448 seems the most likely date. Before 460 Pericles' influence was as yet too small; 460–451 were years of war. After 445 Athens was hardly in a position to summon such a congress, and would not have sent 10 envoys out of 20 to northern and central Greece, where she had just lost all her influence; nor is it likely that the building of the Parthenon (begun not later than 447) was entered on before the congress.

While scouting the projects of the extreme Radicals for interfering in distant countries, he occasionally made a display of Athens' power abroad, as in his expedition to the Black Sea,[1] and in the colonization of Thruii,[2] which marks the resumption of a Western policy.

The peaceful development of Athenian power was interrupted by the revolt of Samos in 440. Pericles himself led out a fleet against the seceders and, after winning a first engagement, unwisely divided his armament and allowed one squadron to be routed. In a subsequent battle he retrieved this disaster, and after a long blockade reduced the town itself. A demand for help which the Samians sent to Sparta was rejected at the instance of the Corinthians.

Turning to Pericles' policy towards the members of the Delian League, we find that he frankly endeavoured to turn the allies into subjects (see DELIAN LEAGUE). A special feature of his rule was the sending out of numerous cleruchies (*q.v.*), which served the double purpose of securing strategic points to Athens and converting the needy proletariate of the capital into owners of real property. The land was acquired either by confiscation from disaffected states or in exchange for a lowering of tribute. The chief cleruchies of Pericles are: Thracian Chersonese (453–452), Lemnos and Imbros, Andros, Naxos and Eretria (before 447);[3] Brea in Thrace (446); Oreus (445); Amisus and Astacus in the Black Sea (after 440); Aegina (431).

In his home policy Pericles carried out more fully Ephialtes' project of making the Athenian people truly self-governing. His chief innovation was the introduction of payment from the public treasury for state service. Chief of all, he provided a remuneration of 1 to 2 obols a day for the jurymen, probably in 451.[4] Similarly he created a "theoricon" fund which enabled poor citizens to attend the dramatic representations of the Dionysia. To him we may also attribute the 3 obols pay which the soldiers received during the Peloponnesian War in addition to the old-established provision-money. The archons and members of the boulê, who certainly received remuneration in 411, and also some minor magistrates, were perhaps paid for the first time by Pericles. In connexion with this system of salaries should be mentioned a somewhat reactionary law carried by Pericles in 451, by which an Athenian parentage on both sides was made an express condition of retaining the franchise and with it the right of sitting on paid juries. The measure by which the archonship was opened to the third and (practically) to the fourth class of citizens (the Zeugitae and Thetes) may also be due to Pericles; the date is now known to be 457 (*Const. Ath.* 26; and see ARCHON).

The last years of his life were troubled by a new period of storm and stress which called for his highest powers of calculation and self-control. A conflict between Corcyra and Corinth, the second and third naval powers of Greece, led to the simultaneous appearance in Athens of an embassy from either combatant (433). Pericles had, as it seems, resumed of late a plan of Western expansion by forming alliances with Rhegium and Leontini, and the favourable position of Corcyra on the trade-route to Sicily and Italy, as well as its powerful fleet, no doubt helped to induce him to secure an alliance with that island, and so to commit an unfriendly act towards a leading representative of the Peloponnesian League. Pericles now seemed to have made up his mind that war with Sparta, the head of that League, had become inevitable. In the following spring he fastened a quarrel upon Potidaea, a town in Chalcidice, which was attached by ancient bonds to Corinth, and in the campaign which followed Athenian and Corinthian troops came to blows. A further *casus belli* was provided by a decree forbidding the importation of Megarian goods into the Athenian Empire,[5] presumably in order to punish Megara for her alliance with Corinth (spring 432). The combined complaints of the injured parties led Sparta to summon a Peloponnesian congress which decided on war against Athens, failing a concession to Megara and Corinth (autumn 432). In this crisis Pericles persuaded the wavering assembly that compromise was useless, because Sparta was resolved to precipitate a war in any case. A further embassy calling upon the Athenians to expel the accursed family of the Alcmaeonidae, clearly aimed at Pericles himself as its chief representative was left unheeded, and early in 431 hostilities began between Athens and Sparta and their respective allies (see PELOPONNESIAN WAR).

At the same time, Pericles was being sorely hampered by his adversaries at home. The orthodox Conservatives and some democrats who were jealous of his influence, while afraid to beard the great statesman himself, combined to assail his nearest friends. The sculptor Pheidias (*q.v.*) was prosecuted on two vexatious charges (probably in 433), and before he could disprove the second he died under arrest. Anaxagoras was threatened with a law against atheists, and felt compelled to leave Athens. A scandalous charge against his mistress Aspasia, which he defeated by his personal intercession before the court, was taken very much to heart by Pericles. His position at home scarcely improved during the war. His policy of abandoning the land defence was unpopular with the land-owning section of the people, who from the walls of Athens could see their own property destroyed by the invaders. At the end of the first year of war (early in 430) Pericles made a great appeal to the pride of his countrymen in his well-known funeral speech. But in the ensuing summer, after a terrible outbreak of plague had ravaged the crowded city, the people became thoroughly demoralized. Pericles led a large squadron to harry the coasts of the Peloponnese, but met with little success. On his return the Athenians sued for peace, though without success, and a speech by Pericles had little effect on their spirits. Late in 430 they deposed him from his magistracy. In addition to this they prosecuted him on a charge of embezzlement, and imposed a fine of 50 talents. A revulsion of feeling soon led to his reinstatement, apparently with extraordinary powers. But the plague, which had carried off two of his sons and a sister, had left its mark also on Pericles himself. In the autumn of 429 he died[6] and was buried near the Academia, where Pausanias (150 A.D.) saw his tomb. A slightly idealized portrait of Pericles as *strategus* is preserved to us in the British Museum bust, No. 549, which is a good copy of the well-known bronze original by Cresilas.

If we now endeavour to give a general estimate of Pericles' character and achievements, it will be well to consider the many departments of his activity one by one. In his foreign policy Pericles differs from those statesmen of previous generations who sought above all the welfare of Greece as a whole. His standpoint was at all times purely Athenian. Nor did he combine great statesmanlike qualities with exceptional ability in the field. We may clearly distinguish two periods in his administration of foreign affairs. At first, joining to Cimon's anti-Persian ambitions and Themistocles' schemes of Western expansion a new policy of aggression on the mainland, he endeavoured to push forward Athenian power in every direction, and engaged himself alike in Greece Proper, in the Levant and in Sicily. After Cimon's death he renounced the war against Persia, and the collapse of 447–445 had the effect of completing his change

[1] The date can hardly be fixed; probably it was after 440.

[2] It has been doubted whether Pericles favoured this enterprise, but among its chief promoters were two of his friends, Lampon the soothsayer and Hippodamus the architect. The oligarch Cratinus (in a frag. of the Φυγάδες) violently attacks the whole project.

[3] These dates are suggested by the decrease of tribute which the inscriptions prove for this year.

[4] This is the date given by the *Const. Ath.*, which also mentions a διαψη[φισμὸς τῶν δικαστῶν] (Blass' restoration) in frag. c. 18. The confused story of Philochorus and Plutarch, by which 4760 citizens were disfranchised or even sold into slavery in 445, when an Egyptian prince sent a largess of corn, may refer to a subsequent application of Pericles' law, though probably on a much milder scale than is here represented.

[5] The general impression in Greece was that this decree was the proximate cause of the war. The scurrilous motives which Aristophanes suggests for this measure can be entirely disregarded.

[6] His dying boast, that "no Athenian had put on mourning through his doing," perhaps refers to his forbearance towards his political rivals, whom he refused to ruin by prosecution.

of attitude. Henceforward he repressed all projects of reckless enterprise, and confined himself to the gradual expansion and consolidation of the empire. It is not quite easy to see why he abandoned this successful policy in order to hasten on a war with Sparta, and neither the Corcyrean alliance nor the Megarian decree seems justified by the facts as known to us, though commercial motives may have played a part which we cannot now gauge. In his adoption of a purely defensive policy at the beginning of the Peloponnesian War, he miscalculated the temper of the Athenians, whose morale would have been better sustained by a greater show of activity. But in the main his policy in 431–429 was sound, and the disasters of the war cannot fairly be laid to his charge. The foundation of cleruchies was an admirable device, which in many ways anticipated the colonial system of the Romans.

In his attitude towards the members of the Delian League Pericles likewise maintained a purely Athenian point of view. But he could hardly be said seriously to have oppressed the subject cities, and technically all the League money was spent on League business, for Athena, to whom the chief monuments in Athens were reared, was the patron goddess of the League. Under Pericles Athens also attained her greatest measure of commercial prosperity, and the activity of her traders all over the Levant, the Black Sea and the West, is attested not only by literary authority, but also by numerous Attic coins, vases, &c.

Pericles' home policy has been much debated since ancient times. His chief enactments relate to the payment of citizens for State service. These measures have been interpreted as an appeal to the baser instincts of the mob, but this assumption is entirely out of keeping with all we know of Pericles' general attitude towards the people, over whom Thucydides says he practically ruled as a king. We must, then, admit that Pericles sincerely contemplated the good of his fellow-countrymen, and we may believe that he endeavoured to realize that ideal Athens which Thucydides sketches in the Funeral Speech—an Athens where free and intelligent obedience is rendered to an equitable code of laws, where merit finds its way to the front, where military efficiency is found along with a free development in other directions and strangles neither commerce nor art. In accordance with this scheme Pericles sought to educate the whole community to political wisdom by giving to all an active share in the government, and to train their aesthetic tastes by making accessible the best drama and music. It was most unfortunate that the Peloponnesian War ruined this great project by diverting the large supplies of money which were essential to it, and confronting the remodelled Athenian democracy, before it could dispense with his tutelage, with a series of intricate questions of foreign policy which, in view of its inexperience, it could hardly have been expected to grapple with successfully.

Pericles also incurred unpopularity because of his rationalism in religious matters; yet Athens in his time was becoming ripe for the new culture, and would have done better to receive it from men of his circle—Anaxagoras, Zeno, Protagoras and Meton—than from the more irresponsible sophists. The influence of Aspasia on Athenian thought, though denounced unsparingly by most critics, may indeed have been beneficial, inasmuch as it tended towards the emancipation of the Attic woman from the over-strict tutelage in which she was kept. As a patron of art Pericles was a still greater force. His policy in encouraging the drama has already been mentioned: among his friends he could count three of the greatest Greek writers—the poet Sophocles and the historians Herodotus and Thucydides. Pericles likewise is responsible for the epoch-making splendour of Attic art in his time, for had he not so fully appreciated and given such free scope to the genius of Pheidias, Athens would hardly have witnessed the raising of the Parthenon and other glorious structures, and Attic art could not have boasted a legion of first-rate sculptors of whom Alcamenes, Agoracritus and Paeonius are only the chief names. (See also GREEK ART.)

Of Pericles' personal characteristics we have a peculiarly full and interesting record. He was commonly compared to Olympian Zeus, partly because of his serene and dignified bearing, partly by reason of the majestic roll of the thundering eloquence, with its bold poetical imagery, with which he held friend and foe spellbound. The same dignity appeared in the grave beauty of his features, though the abnormal height of his cranium afforded an opportunity for ridicule of which the comedians made full use. In spite of an unusually large crop of scandals about him we cannot but believe that he bore an honourable character, and his integrity is vouched for by Thucydides in such strong terms as to exclude all further doubt on the question.

ANCIENT AUTHORITIES.—Our chief source must always remain Thucydides (i. and ii. 1–65), whose insight into the character and ideals of Pericles places him far above all other authorities. The speeches which he puts into his mouth are of special value in disclosing to us Pericles' inmost thoughts and aspirations (i. 140–144; ii. 35–46; ii. 60–64). Thucydides alone shows sympathy with Pericles, though, as J. B. Bury points out (*Ancient Greek Historians*, 1909, pp. 133 seq.), he was by no means a blind admirer. Of other 5th-century sources, Aristophanes is obviously a caricaturist, pseudo-Xenophon (*de republica Atheniensium*) a mere party pamphleteer. Plato, while admiring Pericles' intellect, accuses him of pandering to the mob; Aristotle in his *Politics* and especially in the *Constitution of Athens*, which is valuable in that it gives the dates of Pericles' enactments as derived from an official document, accepts the same view. Plutarch (*Pericles*) gives many interesting details as to Pericles' personal bearing, home life, and patronage of art, literature and philosophy, derived in part from the old comic poets, Aristophanes, Cratinus, Eupolis, Hermippus, Plato and Teleclides; in part from the contemporary memoirs of Stesimbrotus and Ion of Chios. At the same time he reproduces their scandalous anecdotes in a quite uncritical spirit, and accepts unquestioningly the 4th-century tradition. He quotes Aristotle, Heraclides Ponticus, Aeschines Socraticus, Idomeneus of Lampsacus and Duris of Samos, and is also indebted through some Alexandrine intermediary to Ephorus and Theopompus. Diodorus (xi. and xii.), who copied Ephorus, contains nothing of value.

MODERN WORKS.—Historians are agreed that Pericles was one of the most powerful personalities of ancient times, and generally allow him to have been a man of probity. J. Beloch, *Griech. Gesch.* vols. i. and ii. (Strassburg and Bonn, 1893–1896), and *Die attische Politik seit Perikles* (Leipzig, 1884), takes the most disparaging view; E. Abbott, *Greek Hist.*, vol. ii. (London, 1892), and M. Duncker, *Gesch. d. Altertums*, vols. viii., ix. (Leipzig, 1884–1886), are on the whole unfavourable; Adolf Schmidt, *Das Perikleische Zeitalter* (Jena, 1877), V. Duruy, *History of Greece* (Eng. trans., London, 1892), G. Busolt, *Griech. Gesch.*, vol. iii. (Gotha, 1897, 1904), and E. Meyer, *Gesch. d. Altertums*, vols. iii. and iv. (Stuttgart, 1901), *Forschungen*, vol. ii. (Halle, 1899; London, 1902), apportion praise and blame more equally; J. B. Bury and E. Curtius, *Hist. of Greece* (Eng. trans., vols. ii. and iii., London, 1869, 1870), A. Holm, *Hist. of Greece* (Eng. trans., vol. ii., London, 1895), W. Lloyd, *The Age of Pericles* (London, 1875), and especially G. Grote, *Hist. of Greece*, vols. iv. and v. (see also additional notes in the edition by J. M. Mitchell and M. Caspari, 1907), take a favourable view. For Pericles' buildings, see C. Wachsmuth, *Gesch. d. Stadt Athen*, i. 516–560 (Leipzig, 1874); E. A. Gardner, *Ancient Athens* (London, 1902); for his strategy, H. Delbrück, *Die Strateg. d. Perikles* (Berlin, 1890). See ATHENS: *History*; GREECE: *Ancient History*; and GREEK ART. (M. O. B. C.)

PERIDOT, sometimes written peridote, a name applied by jewelers to "noble olivine," or that kind of olivine which can be used as a gem-stone (see OLIVINE). The word peridot is an old trade-term, of unknown origin, used by French jewelers and introduced into science by J. R. Haüy. Peridot is practically the same stone as chrysolite (*q.v.*), though it is convenient to restrict that term to transparent olivine of pale yellowish green colour, and to apply the term peridot to those kinds which are darker and decidedly green: the colour, which is due to the presence of ferrous iron, is never vivid, like that of emerald, but is usually some shade of olive-, pistachio- or leek-green. Although the stone is sometimes cut *en cabochon*, and in rose-form, the cutting best adapted to display the colour is that of a table or a step-cut stone. Unfortunately the hardness of peridot is only about 6·5, or but little above that of glass, so that the polished stone readily suffers abrasion by wear. In polishing peridot the final touch is given on a copper wheel moistened with sulphuric acid.

Although olivine has a fairly wide distribution in nature, the varieties used as gem-stones are of very limited occurrence. Much mystery for a long time surrounded the locality which

yields most of the peridot of commerce, but it is now identified with the island of St John, or Isle Zeboiget, in the Red Sea, where it occurs, as shown by M. J. Couyat, in an altered dunite, or olivine rock (*Bull soc. franç. min.*, 1908). This is probably the Topaz Isle, τοπάζιος νῆσος, of the ancients. It is generally held that the mineral now called topaz was unknown to ancient and mediaeval writers, and that their τοπάζιον was our peridot. Such was probably the Hebrew *pitdah*, translated topaz in the Old Testament. Dr G. F. Kunz has suggested that the peridots of modern trade are largely derived from old jewelry. The famous shrine of the Three Kings in Cologne Cathedral contains a large peridot, which has commonly been regarded as an emerald. It is notable that pebbles of transparent olivine, fit for cutting, are found in the United States in Montana, Arizona and New Mexico; in consequence of their shape and curiously pitted surface they are known as "Job's tears." (F. W. R.*)

PERIDOTITE, a plutonic holo-crystalline rock composed in large part of olivine, and almost or entirely free from feldspar. The rocks are the most basic, or least siliceous plutonic rocks, and contain much iron oxide and magnesia. Hence they have dark colours and a high specific gravity (3·0 and over). They weather readily and are changed to serpentine, in which process water is absorbed and enters into chemical combination with the silicates of magnesia and iron. In some peridotites, such as the dunites, olivine greatly preponderates over all other minerals. It is always in small, rather rounded crystals without good crystalline form, and pale green in colour. Most of the rocks of this group, however, contain other silicates such as augite, hornblende, biotite or rhombic pyroxene, and often two or three of these are present. By the various mineral combinations different species are produced, *e.g.* mica-peridotite, hornblende-peridotite, enstatite-peridotite. Of the accessory minerals the commonest are iron oxides and chromite or picotite In some peridotites these form segregations or irregular masses which are of importance as sources of the ores of chromium. Corundum occurs in small crystals in many North American peridotites and platinum and the nickel-iron compound awaruite are found in rocks of this class in New Zealand. Red garnet (pyrope) characterizes the peridotites of Bohemia. The diamond mines of South Africa are situated in pipes or volcanic necks occupied by a peridotite breccia which has been called kimberlite. In this rock in addition to diamond the following minerals are found, hypersthene, garnet, biotite, pyroxene (chrome-diopside), ilmenite, zircon, &c.

Some peridotites have a granular structure, *e.g.* the dunites, all the crystal grains being of rounded shape and nearly equal size; a few are porphyritic with large individuals of diallage, augite or hypersthene. Some are banded with parallel bands of dissimilar composition, the result probably of fluxion in a magma which was not quite homogeneous. The great majority of the rocks of this group are poikilitic, that is to say, they contain olivine in small rounded crystals embedded in large irregular masses of pyroxene or hornblende. The structure is not unlike that known as ophitic in the dolerites, and arises from the olivine having first separated out of the liquid magma while the pyroxene or amphibole succeeded it and caught up its crystals. In hand specimens of the rocks the smooth and shining cleavage surfaces of hornblende and augite are dotted over with dull blackish green spots of olivine; to this appearance the name "lustre-mottling" has been given.

Mica-peridotites are not of frequent occurrence. A well-known rock from Kaltes Thal, Harzburg, contains much biotite, deep brown in thin section. Other examples are found in India and in Arkansas. Poikilitic structure is rarely well developed in this group. The "blue-ground" of Kimberley which contains the diamonds is a brecciform biotite-hypersthene-peridotite with augite. In the north of Scotland, in several places in Sutherland and Ross, there are peridotites with silvery yellow green biotite and large plates of pale green hornblende: these have been called scyelites. In the hornblende-peridotites lustre-mottling is often very striking. The amphibole may be colourless tremolite in small prisms, as in some varieties of serpentine from the Lizard (Cornwall); or pale green hornblende as in scyelite. In both these cases there is some probability that the hornblende has developed, partly at least, from olivine or augite. In sheared peridotites tremolite and actinolite are very frequent. Other rocks contain dark brown hornblende, with much olivine; there may also be augite which is often intergrown perthitically with the hornblende. Examples of this type occur in North Wales, Anglesey, Cornwall, Cortland, New York, and many other localities. A well-known peridotite from Schriesheimer Tal in the Odenwald has pale brownish green amphibole in large crystals filled with small grains of olivine which are mostly serpentinized. Very often primary brown hornblende in rocks of this type is surrounded by fringes and outgrowths of colourless tremolite which has formed as a secondary mineral after olivine. Complete pseudomorphs after olivine composed of a matrix of scaly talc and chlorite crossed by a network of tremolite needles, are also very common in some peridotites, especially those which have undergone pressure or shearing; these aggregates are known as pilite.

The peridotites which contain monoclinic pyroxene may be divided into two classes, those rich in diallage and those in which there is much augite. The diallage-peridotites have been called wehrlites; often they show excellent lustre-mottling. Brown or green hornblende may surround the diallage, and hypersthene may occur also in lamellar intergrowth with it. Some of these rocks contain biotite, while a little feldspar (often saussuritic) may often be seen in the sections. Rocks of this kind are known in Hungary, in the Odenwald and in Silesia. In Skye the pyroxene-bearing peridotites usually contain green chrome-diopside (a variety of augite distinguished by its pale colour and the presence of a small amount of chromium). The augite-peridotites are grouped by German petrographers under the picrites, but this term has a slightly different signification in the English nomenclature (see PICRITE).

The enstatite-peridotites are an important group represented in many parts of the world. Their rhombic pyroxene is often very pale coloured but may then be filled with platy enclosures which give it a metallic or bronzy lustre. These rocks have been called saxonites or harzburgites. When weathered the enstatite passes into platy masses of bastite. Picotite and chromite are common accessory minerals and diallage or hornblende may also be present. Many of the serpentine rocks of the Lizard (Cornwall) Ayrshire and north-western Scotland are of this type. Examples are known also from Baste near Harzburg, New York and Maryland, Norway, Finland, New Zealand, &c. Often the enstatite crystals are of large size and are very conspicuous in the hand specimens. They may be porphyritic, or may form a coarsely crystalline matrix enclosing innumerable olivine grains, and then lustre-mottling is as a rule very well shown.

The lherzolites are rocks, first described from Lherz in the Pyrenees, consisting of olivine, chrome-diopside and enstatite, and accessory picotite or chromite. They are fine-grained, bright green in colour, often very fresh, and may be somewhat granulitic. The dunites are peridotites, similar to the rock of Dun Mountain, New Zealand, composed essentially of olivine in a finely granular condition. Many examples of this type are known in different parts of the world, usually as local facies of other kinds of peridotite. In olivine-basalts of Tertiary age in the Rhine district small nodules of green olivine occur frequently. They are of rounded shapes and may be a foot in diameter. The structure is granular and in addition to olivine they may contain chromite, spinel and magnetite, enstatite and chrome-diopside. Some geologists believe these to be fragments of dunite detached from masses of that rock not exposed at the surface; others consider that they are aggregations of the early minerals of the basalt magma, which were already crystallized before the liquid rock was emitted.

The great majority of stony or lithoidal meteorites (aerolites) are rich in olivine and present many analogies to the terrestrial peridotites. Among their minerals are hypersthene (enstatite) augite and chrome-diopside, chromite, pyrite and troilite, nickeliferous iron and basic plagioclase felspar. The structure of these meteorites is described as "chondritic"; their minerals often occur as small rounded grains arranged in radiate clusters; this has very rarely been observed in ordinary peridotites.

Although many peridotites are known in which the constituent minerals are excellently preserved, the majority show more or less advanced decomposition. The olivine is especially unstable and is altered to serpentine, while augite, hornblende and biotite are in large measure fresh. In other cases the whole rock is changed to an aggregate of secondary products. Most serpentines (*q.v.*) arise in this way. (J. S. F.)

PÉRIER, CASIMIR PIERRE (1777–1832), French statesman, was born at Grenoble on the 11th of October 1777, the fourth son of a rich banker and manufacturer, Claude Périer (1742–1801), in whose house the estates of Dauphiny met in 1788. Claude Périer was one of the first directors of the Bank of France; of his eight sons, Augustin (1773–1833), Antoine Scipion (1776–1821), Casimir Pierre and Camille (1781–1844), all distinguished themselves in industry and in politics. The family removed to Paris after the revolution of Thermidor, and Casimir joined the army of Italy in 1798. On his father's death he left the

army and with his brother Scipion founded a bank in Paris, the speculations of which he directed while Scipion occupied himself with its administration. He opposed the ruinous methods by which the duc de Richelieu sought to raise the war indemnity demanded by the Allies, in a pamphlet *Réflexions sur le projet d'emprunt* (1817), followed in the same year by *Dernières réflexions* . . . in answer to an inspired article in the *Moniteur*. In the same year he entered the chamber of deputies for Paris, taking his seat in the Left Centre with the moderate opposition, and making his first speech in defence of the freedom of the press. Re-elected for Paris in 1822 and 1824, and in 1827 for Paris and for Troyes, he elected to represent Troyes, and sat for that constituency until his death. Perier's violence in debate was not associated with any disloyalty to the monarchy, and he held resolutely aloof from the republican conspiracies and intrigues which prepared the way for the revolution of 1830. Under the Martignac ministry there was some prospect of a reconciliation with the court, and in January 1829 he was nominated a candidate for the presidency of the chamber; but in August with the elevation to power of Polignac the truce ceased, and on the 15th of March 1830 he was one of the 221 deputies who repudiated the pretensions put forward by Charles X. Averse by instinct and by interest to popular revolution he nevertheless sat on the provisory commission of five at the hôtel-de-ville during the days of July, but he refused to sign the declaration of Charles X.'s dethronement. Périer reluctantly recognized in the government of Louis Philippe the only alternative to the continuance of the Revolution; but he was no favourite with the new king, whom he scorned for his truckling to the mob. He became president of the chamber of deputies, and sat for a few months in the cabinet, though without a portfolio. On the fall of the weak and discredited ministry of Laffitte, Casimir Périer, who had drifted more and more to the Right, was summoned to power (March 13, 1831), and in the short space of a year he restored civic order in France and re-established her credit in Europe. Paris was in a constant state of disturbance from March to September, and was only held in check by the premier's determination; the workmen's revolt at Lyons was suppressed after hard fighting; and at Grenoble, in face of the quarrels between the military and the inhabitants, Périer declined to make any concession to the townsfolk. The minister refused to be dragged into armed intervention in favour of the revolutionary government of Warsaw, but his policy of peace did not exclude energetic demonstrations in support of French interests. He constituted France the protector of Belgium by the prompt expedition of the army of the north against the Dutch in August 1831; French influence in Italy was asserted by the audacious occupation of Ancona (Feb. 23, 1832); and the refusal of compensation for injuries to French residents by the Portuguese government was followed by a naval demonstration at Lisbon. Périer had undertaken the premiership with many forebodings, and overwork and anxiety prepared the way for disease. In the spring of 1832 during the cholera outbreak in Paris, he visited the hospitals in company with the duke of Orleans. He fell ill the next day of a violent fever, and died six weeks later, on the 16th of May 1832.

His *Opinions et discours* were edited by A. Lesieur (2 vols., 1838); C. Nicoullaud published in 1894 the first part (*Casimir-Périer, député de l'opposition, 1817–1830*) of a study of his life and policy; and his ministry is exhaustively treated by Thureau-Dangin in vols. i. and ii. (1884) of his *Histoire de la monarchie de juillet*.

His elder son, Auguste Victor Laurent Casimir Périer (1811–1876), the father of President Casimir-Périer (see Casimir-Périer), entered the diplomatic service, being attached successively to the London, Brussels and St Petersburg embassies, and in 1843 became minister plenipotentiary at Hanover. In 1846 he resigned from the service to enter the legislature as deputy for the department of Seine, a constituency which he exchanged for Aube after the Revolution of 1848. On the establishment of the Second Empire he retired temporarily from public life, and devoted himself to economic questions, on which he published a series of works, notably *Les Finances et la politique* (1863), dealing with the interaction of political institutions and finance. He contested Grenoble unsuccessfully in 1863 against the imperial candidate, Casimir Royer; and failed again for Aube in 1869. In 1871 he was returned by three departments to the National Assembly, and elected to sit for Aube. He was minister of the interior for a few months in 1871–1872, and his retirement deprived Thiers of one of the strongest elements in his cabinet. He also joined the short-lived ministry of May 1873. He consistently opposed all efforts in the direction of a monarchical restoration, but on the definite constitution of the republic became a life senator, declining MacMahon's invitation to form the first cabinet under the new constitution. He died in Paris on the 6th of June 1876.

For the family in general see E. Choulet, *La Famille Casimir-Périer* (Grenoble, 1894).

PERIGEE (Gr. περί, near, γῆ, the earth), in astronomy that point of the moon's orbit or of the sun's apparent orbit at which the moon or sun approach nearest to the earth. The sun's perigee and the earth's perihelion are so related that they differ 180° in longitude, the first being on the line from the earth toward the sun, and the second from the sun toward the earth. The longitude of the solar perigee is now 101°, that of the earth's perihelion 281°.

PÉRIGORD, one of the old provinces of France, formed part of the military government of Guienne and Gascony, and was bounded on the N. by Angoumois, on the E. by Limousin and Quercy, on the S. by Agenais and Bazadais, and on the W. by Bordelais and Saintonge. It is now represented by the departments of Dordogne and part of Lot-et-Garonne. Périgord was in two divisions: Périgord blanc (cap. Périgueux) and Périgord noir (cap. Sarlat). In the time of Caesar it formed the *civitas Petrocoriorum*, with Vesunna (Périgueux) as its capital. It became later part of *Aquitania secunda* and formed the *pagus petragoricus*, afterwards the diocese of Périgueux. Since the 8th century it had its own counts (see the *Histoire généalogique* of P. Anselme, tome iii.), who were feudatories of the dukes of Aquitaine and in the 13th century were the vassals of the king of England. In the 15th century the county passed into the hands of the dukes of Orleans, and in the 16th came to the family of d'Albret, becoming Crown land again on the accession of Henry IV.

See Dessalles, *Histoire du Périgord* (1888), the Bulletin of the *Société historique et archéologique du Périgord* (1874 seq.), *l'Inventaire sommaire de la "Collection de Périgord"* in the Bibliothèque Nationale (1874); the *Dictionnaire topographique du département de la Dordogne* by the Vicomte de Gourgues (1873).

PÉRIGUEUX, a town of south-western France, formerly capital of the old province of Périgord, now chief town of the department of Dordogne, 79 m. E.N.E. of Bordeaux, on the railway between that city and Limoges. Pop. (1906), 28,199. The town, situated on an eminence on the right bank of the Isle, is divided into three parts. On the slope of the hill is the medieval town, bordered south-east by the river and on the other three sides by esplanades and promenades; to the west is the modern town, which stretches to the station; to the south of the modern town is the old Roman town or *cité*, now traversed by the railway.

Three bridges connect Périgueux with the left bank of the Isle, where stood Vesunna, the capital of the Petrocorii. Hardly a trace of this old Gallic town remains, but not far off, on the Plateau de la Boissière, the rampart of the old Roman camp can still be traced. On the right bank of the Isle, in the Roman city, there have been discovered some baths of the 1st or 2nd century, supplied by an aqueduct four miles long, which spanned the Isle. A circular building, called the "Tower of Vesunna," 68 ft. in diameter and 89 ft. in height, stands at what was formerly the centre of the city, where all the chief streets met. It is believed to have been originally the cella or main part of a temple, probably dedicated to the tutelary deities of Vesunna. Of the amphitheatre there still remain huge fragments of wall and vaulting. The building had a diameter of 1312 ft., that of the arena being 870 ft.; and, judging from its construction,

must be as old as the 3rd or even the 2nd century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitation, and the sisters took from it the stones required for the construction of their nunnery. The most remarkable, however, of the ruins of the *cité* is the Château Barrière, an example of the fortified houses formerly common there. Two of its towers date from the 3rd or 4th century, and formed part of the fortified enceinte; the highest tower is of the 10th century; and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century.

The chief medieval building in the *cité* is the church of St Étienne, once the cathedral. It dates from the 11th and 12th centuries, but suffered much injury at the hands of the Protestants in the religious wars when the tower and two of the three cupolas were destroyed. The choir and its cupola were skilfully restored in the 17th century. A fine carved wooden reredos of the 17th century and a tomb of a bishop of the 12th century are to be seen in the interior. In the medieval town, known as Le Puy-St-Front, the most remarkable building is the cathedral of St Front, which, till its restoration, or rather rebuilding, in the latter half of the 19th century when the old features were to a great extent lost, was of unique architectural value. It bears a striking resemblance to the Byzantine churches and to St Mark's at Venice, and according to one theory was built from 984 to 1047, contemporaneously with the latter (977–1085). It consists of five great cupolas, arranged in the form of a Greek cross, and conspicuous from the outside. The arms of the cross are 69 ft. in width, and the whole is 184 ft. long. These cupolas, 89 ft. high from the keystone to the ground, are supported on a vaulted roof with pointed arches after the manner characteristic of Byzantine architecture. The pointed arches imitated from it prepared the way for the introduction of the Gothic style. Adjoining St Front on the west are the remains of an old basilica of the 6th century, above which rises the belfry, the only one in the Byzantine style now extant. It dates from the 11th century, and is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. To the south-west of St Front, the buildings of an old abbey (11th to 16th century) surround a cloister dating chiefly from the 13th century. Of the fortifications of Puy St Front, the chief relic is the Tour Mataguerre (14th century).

Périgueux is seat of a bishop, prefect and court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce and a branch of the Bank of France. Its educational establishments include a lycée for boys, training colleges for both sexes and a school of drawing. The trade of the town is in pigs, truffles, flour, brandy, poultry and pies known as *pâtés de Périgord*.

Vesunna was the capital of the Petrocorii, allies of Vercingetorix when Caesar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the right bank of the Isle opposite the site of the Gallic town. The barbarian invasion brought this prosperity to a close. St Front preached Christianity here in the 4th century and over his tomb there was raised a monastery, which became the centre of the new town called Le Puy St Front. The *cité* was pillaged by the Saracens about 731, and in 844 the Normans devastated both quarters. The new town soon began to rival the old city in importance, and it was not until 1240 that the attempts of the counts of Périgord and the bishops to infringe on their municipal privileges brought about a treaty of union. During the Hundred Years' War, Périgueux was twice attacked by the English, who took the *cité* in 1356; and the whole town was ceded to them by the Treaty of Brétigny, but returned to the French Crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon, father of Henry IV., and was converted by the latter into royal domain. During the Huguenot wars Périgueux was frequently a stronghold of the Calvinists, who in 1575 did great destruction there, and it also suffered during the troubles of the Fronde.

PERIHELION (Gr. περί, near, ἥλιος, sun), in astronomy, the point of nearest approach of a body to the sun. (See ORBIT.)

PERIM, a British island in the strait of Bab-el-Mandeb, at the entrance to the Red Sea, and 96 m. W. by S. of Aden. Perim is 2 m. from the Arabian shore, is about 3½ m. long with an average breadth of over a mile, and covers some 7 sq. m. There is a good harbour with easy entrance on the south side with a depth of water from 25 to 30 ft. It is largely used by mercantile vessels as a coaling-station and for taking in stores, including fresh water and ice. Perim, the Diodoros island of the *Periplus*, was, in consequence of the French occupation of Egypt, garrisoned from 1799 to 1801 by a British force. In view of the construction of the Suez Canal and the increasing importance of the Red Sea route to India the island was annexed to Great Britain in 1857, fortified and placed under the charge of the Aden residency. In 1861 a lighthouse was built at its eastern end. Submarine cables connect the island with Aden, Egypt and Zanzibar. Population, including a garrison of 50 sepoys, about 200.

PERINO DEL VAGA (1500–1547), a painter of the Roman school, whose true name was PERINO (or PIERO) BUONACCORSI. He was born near Florence on the 28th of June 1500. His father ruined himself by gambling, and became a soldier in the invading army of Charles VIII. His mother dying when he was but two months old, he was suckled by a she-goat; but shortly afterwards he was taken up by his father's second wife. Perino was first apprenticed to a druggist, but soon passed into the hands of a mediocre painter, Andrea da Ceri, and, when eleven years of age, of Ridolfo Ghirlandajo. Perino rapidly surpassed his fellow-pupils, applying himself especially to the study of Michelangelo's great cartoon. Another mediocre painter, Vaga from Toscanella, undertook to settle the boy in Rome, but first set him to work in Toscanella. Perino, when he at last reached Rome, was utterly poor, and with no clear prospect beyond journey-work for trading decorators. He, however, studied with great severity and spirit from Michelangelo and the antique, and was eventually entrusted with some of the subordinate work undertaken by Raphael in the Vatican. He assisted Giovanni da Udine in the stucco and arabesque decorations of the loggie of the Vatican, and executed some of those small but finely composed scriptural subjects which go by the name of "Raphael's Bible"—Raphael himself furnishing the designs. Perino's examples are: "Abraham about to sacrifice Isaac," "Jacob wrestling with the Angel," "Joseph and his Brethren," the "Hebrews crossing the Jordan," the "Fall and Capture of Jericho," "Joshua commanding the Sun to stand still," the "Birth of Christ," "His Baptism" and the "Last Supper." Some of these are in bronze-tint, while others are in full colour. He also painted, after Raphael's drawings, the figures of the planets in the great hall of the Appartamenti Borgia. Perino exhibited very uncommon faculty in these works and was soon regarded as second only to Giulio Romano among the great painter's assistants. To Raphael himself he was always exceedingly respectful and attentive, and the master loved him almost as a son. He executed many other works about Rome, always displaying a certain mixture of the Florentine with the Roman style.

After Raphael's death in 1520 a troublous period ensued for Perino, with a plague which ravaged Rome in 1523, and again with the sack of that city in 1527. Then he accepted an invitation to Genoa, where he was employed in decorating the Doria Palace, and rapidly founded a quasi-Roman school of art in the Ligurian city. He ornamented the palace in a style similar to that of Giulio Romano in the Mantuan Palazzo del Tè, and frescoed historical and mythological subjects in the apartments, fanciful and graceful arabesque work, sculptural and architectural details—in short, whatever came to hand. Among the principal works are: the "War between the Gods and Giants," "Horatius Cocles defending the Bridge," and the "Fortitude

of Mutius Scaevola." The most important work of all, the "Shipwreck of Aeneas," is no longer extant. From Genoa Perino twice visited Pisa, and began some painting in the cathedral. Finally he returned to Rome, where Paul III. allowed him a regular salary till the painter's death. He retouched many of the works of Raphael, and laboured hard on his own account, undertaking all sorts of jobs, important or trivial. Working for any price, he made large gains, but fell into mechanical negligence. Perino was engaged in the general decoration of the Sala Reale, begun by Paul III., when his health, undermined by constant work and as constant irregularities, gave way, and he fell down dead on the 19th of October 1547. He is buried in the Pantheon.

Perino produced some excellent portraits, and his smaller oil pictures combine with the manner of Raphael something of that of Andrea del Sarto. Many of his works were engraved, even in his own lifetime. Daniele Ricciarelli, Girolamo Siciolante da Sermoneta, Luzio Romano and Marcello Venusti (Mantovano) were among his principal assistants. (W. M. R.)

PERINTHUS (Turk. *Eski Eregli*, old Heraclea), an ancient town of Thrace, on the Propontis, 22 m. W. of Selymbria, strongly situated on a small peninsula on the bay of that name. It is said to have been a Samian colony, founded about 599 B.C. According to Tzetzes, its original name was Mygdonia; later it was called Heraclea (Heraclea Thraciae, Heraclea Perinthus). It is famous chiefly for its stubborn and successful resistance to Philip II. of Macedon in 340; at that time it seems to have been more important than Byzantium itself.

PERIOD (Gr. περίοδος, a going or way round, circuit, περί, round, and ὁδός, way, road), a circuit or course of time, a cycle; particularly the duration of time in which a planet revolves round its sun, or a satellite round its primary, a definite or indefinite recurring interval of time marked by some special or peculiar character, *e.g.* in history, literature, art, &c.; it is so used of a division of geological time. Particular uses of the word are for the various phases through which a disease passes, the termination or conclusion of any course of events, the pause at the end of a completed sentence, and the mark (.) used to signify the same (see PUNCTUATION).

PERIODICALS, a general term for literary publications which appear in numbers or parts at regular intervals of time—as a rule, weekly, monthly or quarterly. The term strictly includes "newspapers" (*q.v.*), but in the narrower sense usually intended it is distinguished as a convenient expression for periodical publications which differ from newspapers in not being primarily for the circulation of news or information of ephemeral interest, and in being issued at longer intervals. In modern times the weekly journal has become so much of the nature of a newspaper that it seldom can be called a periodical in this sense. The present article chiefly deals with publications devoted to general literature, literary and critical reviews and magazines for the supply of miscellaneous reading. In the article SOCIETIES (*q.v.*) an account is separately given of the transactions and proceedings of learned and scientific bodies. Year-books, almanacs, directories and other annuals belong to a distinct type of publication, and are not referred to here.

BRITISH

The first literary periodical in English was the *Mercurius librarius, or a Faithful Account of all Books and Pamphlets* (1680), a mere catalogue, published weekly or fortnightly in London, followed by *Weekly Memorials for the Ingenious* (Jan. 16, 1681–1682 to Jan. 15, 1683), which was more of the type of the *Journal des Savants* (see under FRANCE below), whence it borrowed many contributions. Of the *History of Learning* (1691)—another with the same title came out in 1694—only a few numbers appeared, as the conductor, De la Crose, started the monthly *Works of the Learned* (Aug. 1691 to April 1692), devoted principally to continental scholarship. The monthly *Compleat Library* (1692 to 1694) was a venture of John Dunton; the monthly *Memoirs for the Ingenious* (1693), edited by J. de la Crose, ran for 12 months, and another with the same title appeared in the following year, only to enjoy a briefer career. The first periodical of merit and influence was the *History of the Works of the Learned* (1699–1712), largely consisting of descriptions of foreign books. The *Memoirs of Literature*, the first English review consisting entirely of original matter, published in London from 1710 to 1714, had for editor Michel de la Roche, a French Protestant refugee, who also edited at Amsterdam the *Bibliothèque angloise* (1717–1719), and subsequently *Mémoires littéraires de la Grande Bretagne* (1720–1724). Returning to England in 1725, he recommenced his *New Memoirs of Literature* (1725–1728), a monthly, and in 1730 a *Literary Journal*. Dr Samuel Jebb started *Bibliotheca literaria* (1722–1724), to appear every two months, which dealt with medals and antiquities as well as with literature, but only ten numbers appeared. *The Present State of the Republick of Letters* was commenced by Andrew Reid in January 1728, and completed in December 1736. It contained not only excellent reviews of English books but papers from the works of foreigners. Two volumes came out each year. It was successful, as also was the *Historia literaria* (1730–1734) of Archibald Bower.[1] The *Bee, or Universal Weekly Pamphlet* (1733–1735) of the unfortunate Eustace Budgell, and the *Literary Magazine* (1735–1736), with which Ephraim Chambers had much to do, were short-lived. The last named was continued in 1737 as the *History of the Works of the Learned*, and was carried on without intermission until 1743, when its place was taken by *A Literary Journal* (Dublin, 1744–1749), the first review published in Ireland. The *Museum* (1746) of R. Dodsley united the character of a review of books with that of a literary magazine. It came out fortnightly to the 12th of September 1747. Although England can show nothing like the *Journal des savants*, which has flourished almost without a break for two and a half centuries, a nearly complete series of reviews of English literature may be made up from 1681 to the present day.

After the close of the first quarter of the 18th century the literary periodical began to assume more of the style of the modern review, and in 1749 the title and the chief features were united in the *Monthly Review*, established by Ralph Griffiths,[2] who conducted it until 1803, whence it was edited by his son down to 1825. It came to an end in 1845. From its commencement the *Review* dealt with science and literature, as well as with literary criticism. It was Whig in politics and Nonconformist in theology. The first series ran from 1749 to December 1789, 81 vols.; the second from 1790 to 1815, 108 vols.; the third or new series from 1826 to 1830, 15 vols.; and the fourth from 1831 to 1845, 45 vols., when the magazine stopped. There is a general index (1749–1789), 3 vols., and another (1790–1816), 2 vols.

The Tory party and the Established Church were defended in the *Critical Review* (1756–1817), founded by Archibald Hamilton and supported by Smollett, Dr Johnson and Robertson. Johnson contributed to fifteen numbers of the *Literary Magazine* (1756–1758). The reviews rapidly increased in number towards the end of the century. Among the principal were the *London Review* (1775–1780), *A New Review* (1782–1786), the *English Review* (1783–1796), incorporated in 1797 with the *Analytical Review* (1788–1799), the *Anti-Jacobin Review and Magazine* (1798–1821), and the *British Critic* (1793–1843), the organ of the High Church party, and first edited by Archdeacon Nares and Beloe.

Quarterlies.

These periodicals had now become extremely numerous, and many of the leading London publishers found it convenient to maintain their own particular organs. It is not a matter of surprise, therefore, that the authority of the reviews should have fallen somewhat in public estimation. The time was ripe for one which should be quite independent of the booksellers, and which should also aim at a higher standard of excellence. As far back as 1755 Adam Smith, Blair and others had produced an *Edinburgh Review* which only ran to two numbers, and in 1773 Gilbert Stuart and William Smellie issued during three years an *Edinburgh Magazine and Review*. To Edinburgh is also due the first high-class critical journal, the *Edinburgh Review*, established in October 1802 by Jeffrey, Scott, Horner, Brougham and Sydney Smith. It created a new era in periodical criticism, and assumed from the commencement a wider range and more elevated tone than any of its predecessors. The first editor was Sydney Smith, then Jeffrey for many years, and later editors were Macvey Napier, William Empson, Sir G. C. Lewis, Henry Reeve and the Hon. Arthur Elliot. Its buff and blue cover was adopted from the colours of the Whig party whose political principles it advocated. Among its more famous contributors were Lord Brougham, Sir Walter Scott, Carlyle, Hazlitt and Macaulay. Scott, being dissatisfied with the new review, persuaded John Murray, his London publisher, to start its brilliant Tory competitor, the *Quarterly Review* (Feb. 1809), first edited by William Gifford, then by Sir J. T. Coleridge, and subsequently by J. G. Lockhart, Rev. Whitwell Elwin, W. M. Macpherson, Sir Wm. Smith, Rowland Prothero and G. W. Prothero. Among the contributors in successive years were Canning, Scott (who reviewed himself), Robert Southey,

---

[1] Archibald Bower (1686–1766) was educated at Douai, and became a Jesuit. He subsequently professed himself a convert to the Anglican Church, and published a number of works, but was more esteemed for his ability than for his moral character.

[2] The biographers of Goldsmith have made us familiar with the name of Griffiths (1720–1803), the prosperous publisher, with his diploma of LL.D. granted by an American university, and with the quarrels between him and the poet.

must be as old as the 3rd or even the 2nd century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitation, and the sisters took from it the stones required for the construction of their nunnery. The most remarkable, however, of the ruins of the *cité* is the Château Barrière, an example of the fortified houses formerly common there. Two of its towers date from the 3rd or 4th century, and formed part of the fortified enceinte; the highest tower is of the 10th century; and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century.

The chief medieval building in the *cité* is the church of St Étienne, once the cathedral. It dates from the 11th and 12th centuries, but suffered much injury at the hands of the Protestants in the religious wars when the tower and two of the three cupolas were destroyed. The choir and its cupola were skilfully restored in the 17th century. A fine carved wooden reredos of the 17th century and a tomb of a bishop of the 12th century are to be seen in the interior. In the medieval town, known as Le Puy-St-Front, the most remarkable building is the cathedral of St Front, which, till its restoration, or rather rebuilding, in the latter half of the 19th century when the old features were to a great extent lost, was of unique architectural value. It bears a striking resemblance to the Byzantine churches and to St Mark's at Venice, and according to one theory was built from 984 to 1047, contemporaneously with the latter (977–1085). It consists of five great cupolas, arranged in the form of a Greek cross, and conspicuous from the outside. The arms of the cross are 69 ft. in width, and the whole is 184 ft. long. These cupolas, 89 ft. high from the keystone to the ground, are supported on a vaulted roof with pointed arches after the manner characteristic of Byzantine architecture. The pointed arches imitated from it prepared the way for the introduction of the Gothic style. Adjoining St Front on the west are the remains of an old basilica of the 6th century, above which rises the belfry, the only one in the Byzantine style now extant. It dates from the 11th century, and is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. To the south-west of St Front, the buildings of an old abbey (11th to 16th century) surround a cloister dating chiefly from the 13th century. Of the fortifications of Puy St Front, the chief relic is the Tour Mataguerre (14th century).

Périgueux is seat of a bishop, prefect and court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce and a branch of the Bank of France. Its educational establishments include a lycée for boys, training colleges for both sexes and a school of drawing. The trade of the town is in pigs, truffles, flour, brandy, poultry and pies known as *pâtés de Périgord*.

Vesunna was the capital of the Petrocorii, allies of Vercingetorix when Caesar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the right bank of the Isle opposite the site of the Gallic town. The barbarian invasion brought this prosperity to a close. St Front preached Christianity here in the 4th century and over his tomb there was raised a monastery, which became the centre of the new town called Le Puy St Front. The *cité* was pillaged by the Saracens about 731, and in 844 the Normans devastated both quarters. To Raphael himself he was always exceedingly respectful and attentive, and the master loved him almost as a son. He executed many other works about Rome, always displaying a certain mixture of the Florentine with the Roman style.

After Raphael's death in 1520 a troublous period ensued for Perino, with a plague which ravaged Rome in 1523, and again with the sack of that city in 1527. Then he accepted an invitation to Genoa, where he was employed in decorating the Doria Palace, and rapidly founded a quasi-Roman school of art in the Ligurian city. He ornamented the palace in a style similar to that of Giulio Romano in the Mantuan Palazzo del Tè, and frescoed historical and mythological subjects in the apartments, fanciful and graceful arabesque work, sculptural and architectural details—in short, whatever came to hand. Among the principal works are: the "War between the Gods and Giants," "Horatius Cocles defending the Bridge," and the "Fortitude

to use the word magazine in the sense of a periodical of miscellaneous literature. The specially antiquarian, biographical and historical features, which make this magazine so valuable a store-house for information for the period it covers, were dropped in 1868, when an "entirely new series," a miscellany of light literature was successively edited by Gowing, Joseph Hatton and Joseph Knight.

Many other magazines were produced in consequence of the success of these two. It will be sufficient to mention the following: The *Scots Magazine* (1739-1817) was the first published in Scotland; from 1817 to 1826 it was styled the *Edinburgh Magazine*. The *Universal Magazine* (1747) had a short, if brilliant, career; but the *European Magazine*, founded by James Perry in 1782, lasted down to 1826. Of more importance than these, or than the *Royal Magazine* (1759-1771) was the *Monthly Magazine* (1796-1843), with which Priestley and Godwin were originally connected. During thirty years the *Monthly* was conducted by Sir Richard Phillips, under whom it became more statistical and scientific than literary. Class magazines were represented by the Edinburgh *Farmer's Magazine* (1800-1825) and the *Philosophical Magazine* (1798), established in London by Alexander Tilloch; the latter at first consisted chiefly of translations of scientific articles from the French. The following periodicals, all of which date from the 18th century, are still published: the *Gospel Magazine* (1766, with which is incorporated the *British Protestant*), the *Wesleyan Methodist Magazine* (1778), *Curtis's Botanical Magazine* (1786), *Evangelical Magazine* (1793; since 1905 the *Evangelical British Missionary*), the *Philosophical Magazine* (1798), now known as the *London, Edinburgh and Dublin Philosophical Magazine*.

The increased influence of this class of periodical upon public opinion was first apparent in *Blackwood's Edinburgh Magazine*, founded in 1817 by the publisher of that name, and carried to a high degree of excellence by the contributions of Scott, Lockhart, Hogg, Maginn, Syme and John Wilson ("Christopher North"), John Galt and Samuel Warren. It has always remained Liberal in literature and Conservative in politics. The *New Monthly Magazine* is somewhat earlier in date. It was founded in 1814 by the London publisher, Colburn, and was edited in turn by Campbell, Theodore Hook, Bulwer Lytton and Ainsworth. Many of Carlyle's and Thackeray's pieces first appeared in *Fraser's Magazine* (1830), long famous for its personalities and its gallery of literary portraits. The *Metropolitan Magazine* was started in opposition to *Fraser*, and was first edited by Campbell, who had left its rival. It subsequently came into the hands of Captain Marryatt, who printed in it many of his sea-tales. The *British Magazine* (1832-1849) included religious and ecclesiastical information. From Ireland came the *Dublin University Magazine* (1833). The regular price of these magazines was half a crown; the first of the cheaper ones was *Tait's Edinburgh Magazine* (1832-1861) at a shilling. It was Radical in politics, and had Roebuck as one of its founders. *Bentley's Miscellany* (1837-1868) was exclusively devoted to novels, light literature and travels. Several of Ainsworth's romances, illustrated by Cruikshank, first saw the light in *Bentley*. The *Nautical Magazine* (1832) was addressed specially to sailors, and Colburn's *United Service Journal* (1829) to both services. The *Asiatic Journal* (1816) dealt with Oriental subjects.

Cheap Publications.

From 1815 to 1820 a number of low-priced and unwholesome periodicals flourished. The *Mirror* (1823-1849), a twopenny illustrated magazine, begun by John Limbird,[1] and the *Mechanics Magazine* (1823) were steps in a better direction. The political agitation of 1831 led to a further popular demand, and a supply of cheap and healthy serials for the reading multitude commenced with *Chambers's Journal* (1832), the *Penny Magazine* (1832-1845) of Charles Knight, and the *Saturday Magazine* (1832-1844), begun by the Society for Promoting Christian Knowledge. The first was published at 1½d. and the last two at 1d. Knight secured the best authors and artists of the day to write for and illustrate his magazine, which, though at first a commercial success, may have had the reason of its subsequent discontinuance in its literary excellence. At the end of 1832 it had reached a sale of 200,000 in weekly numbers and monthly parts. It came to an end in 1845 and was succeeded by *Knight's Penny Magazine* (1845), which was stopped after six monthly parts. These periodicals were followed by a number of penny weeklies of a lower tone, such as the *Family Herald* (1843), the *London Journal* (1845) and *Lloyd's Miscellany*. In 1850 the sale of the first of them was placed at 175,000 copies, the second at 170,000, and *Lloyd's* at 95,000. In 1846 fourteen penny and three half-penny magazines, twelve social journals, and thirty-seven book-serials were produced every week in London. A further and permanent improvement in cheap weeklies for home reading may be traced from the foundation of *Howitt's Journal* (1847-1849), and more especially *Household Words* (1850), conducted by Charles Dickens, *All the Year Round* (1859), by the same editor, and afterwards by his son, *Once A Week* (1859), and the *Leisure Hour* (1852). The plan of *Notes and Queries* (1849), for the purpose of inter-communication among those interested in special points of literary and antiquarian character, has led to the adoption of similar departments in a great number of newspapers and periodicals, and, besides several imitators in England, there are now parallel journals in Holland, France, and Italy.

Shilling monthlies began with *Macmillan* (1859), the *Cornhill* (1860), first edited by Thackeray, and *Temple Bar* (1860). *St James's Magazine* (1861), *Belgravia* (1866), *St Paul's* (1867-1874), *London Society* (1862), and *Tinsley's* (1867) were devoted chiefly to novels and light reading. Sixpenny illustrated magazines commenced with *Good Words* (1860) and the *Quiver* (1861), both religious in tendency. In 1882 *Fraser* changed its name to *Longman's Magazine*, and was popularized and reduced to sixpence. The *Cornhill* followed the same example in 1883, reducing its price to sixpence and devoting its pages to light reading. The *English Illustrated Magazine* (1883) was brought out in competition with the American *Harper's* and *Century*. The *Pall Mall Magazine* followed in 1893. Of the artistic periodicals we may signalize the *Art Journal* (1849), *Portfolio* (1870), *Magazine of Art* (1878-1904), *Studio* (1893), *Connoisseur* (1901), and *Burlington* (1903). The *Bookman* (1886), for a combination of popular and literary qualities, and the *Badminton* (1895), for sport, also deserve mention. One of the most characteristic developments of later journalism was the establishment in 1890 of the *Review of Reviews* by W. T. Stead. Meanwhile the number of cheap periodicals increased enormously, such as the weekly *Tit-bits* (1881), and *Answers* (1888), and profusely illustrated magazines appeared, like the *Strand* (1891), *Pearson's* (1896), or *Windsor* (1895). Professions and trades now have not only their general class-periodicals, but a special review or magazine for every section. In 1910 the magazines and reviews published in the United Kingdom numbered 2795. Religious periodicals were 668; 338 were devoted to trade; 361 to sport; 691 represented the professional classes; 51 agriculture; and 218 were juvenile periodicals. The London monthlies were 797 and the quarterlies 155.

Indexes to English Periodicals.—A large number of periodicals do not preserve literary matter of permanent value, but the high-class reviews and the archaeological, artistic and scientific magazines contain a great mass of valuable facts, so that general and special indexes have become necessary to all literary workers. Lists of the separate indexes to particular series are given in H. B. Wheatley's *What is an Index?* (1879), W. P. Courtney's *Register of National Bibliography* (1905, 2 vols.), and the *List of Books forming the Reference Library* in the reading room of the British Museum (4th ed. 1910, 2 vols).

AUTHORITIES.—"Periodicals," in the British Museum catalogue; Lowndes, *Bibliographer's Manual, by Hy. G. Bohn* (1864); *Cat. of Periodicals in the Bodl. Lib.*, pt. i., "English Periodicals" (1878); *Cat. of the Hope Collection of Early Newspapers and Essayists in the Bodl. Lib.* (1865); Scudder, *Cat. of Scientific Serials* (1879); Andrews, *Hist. of Brit. Journalism* (1859); Cucheval Clarigny, *Hist. de la Presse en Angleterre et aux Etats Unis* (1857); Madden, *Hist. of Irish Period. Lit.* (1867); J. Grant, *The Great Metropolis*, ii. 229-327; "Periodical Essays of the Age of Anne," in *N. American Rev.* vol. xlvi.; Drake, *Essays on the "Spectator," "Tatler,"* &c. (1810-1814); Courthope, *Addison* ("Engl. Men of Letters," 1884); "Forgotten Periodical Publications," in *Notes and Queries*, 3rd series, vol. ix. p. 53; "Account of Periodical Literary Journals from 1681 to 1749," by S. Parkes, in *Quart. Journ. of Sc., Lit., &c.*, xiii. 36, 289; see also *Notes and Queries*, 1st series, vol. vi. pp. 327, 435; "Last Century Magazines," in *Fraser's Mag.* Sept. (1876), p. 325; "Periodicals during 1712-1732," in *Notes and Queries*, 3rd series, vol. ix. p. 72, &c., x. 134; "Catholic Period. Lit.," ib., 5th series, vol. xi. 427, 494; "Early Roman Catholic Magazines," ib., 6th series, vol. iii. p. 43, &c., iv. 211; Timperley, *Ency. of Lit. Anec.* (1842); C. Knight, *The Old Printer and the Modern Press* (1854), and *Passages of a Working Life* (1864-1865); *Memoir of Robert Chambers* (1872); the *London Cat. of Periodicals, Newspapers, &c.* (1844-1910); *The Bookseller* (February 1867, June and July 1868, August 1874, July 1879); "On the Unstamped Press," *Notes and Queries*, 4th series, vol. x. and xi. (1872-1873), and *English Hist. Review* (1897), xii. 711-726; "Contributions Towards an Index of Serial Stories," by W. L. Fletcher, *Library Journal* (1881), vi. 42, 166; "Byways of Periodical Literature," Walford's *Antiq. Mag.* (1887), xi. 179-186, xii. 65-74; *Catalogue of Magazines &c., recd. at the Melbourne Pub. Lib.* (1891); "English Periodical Literature," by W. Robertson Nicoll, *Bookman* (1895), vol. i.; "The Periodical Press, 1865-1895," by T. H. S. Escott, *Blackwood* (1894), pp. 156, 532; "Bibliography of Periodical Literature," by F. Campbell, *The Library* (1898), viii. 49; "Bibliography of the British Periodical Press," by D. Williams in Mitchell's *Newspaper Directory* (1902), pp. 12-13; "English Reviews," by A. Waugh, *Critic*, vol. 40; "Excursus on Periodical Criticism," Saintsbury, *History of Criticism* (1904), iii. 408-428. As regards the treatment of periodicals in libraries see "Helps for Cataloguers of Serials," by H. C. Bolton in *Boston Bull. of Bibliography* (1897); "Co-operative lists of periodicals," *Library Journal*, (1899), xxiv. 29-32, "Union List of Periodicals in Chicago Libraries," *Public Libraries*, Chicago (1900), v. 60; "Care of Periodicals in a Library," by F. R. Jackson, *Public Libraries*, Chicago (1906), vol. xi. Complete lists of current British periodicals are included in Mitchell's *Newspaper Press Directory*, Street's *Newspaper Directory*, and Willing's *Press Guide*, and a select list and other information are given in the *Literary Year Book*.

[1] John Limbird, to whom even before Chambers or Knight is due the carrying out the idea of a cheap and good periodical for the people, died on the 31st of October 1883, without having achieved the worldly prosperity of his two followers.

must be as old as the 3rd or even the 2nd century. The counts of Périgueux used it for their château, and lived in it from the 12th to the end of the 14th century. In 1644 it was given over by the town to the Order of the Visitation, and the sisters took from it the stones required for the construction of their nunnery. The most remarkable, however, of the ruins of the *cité* is the Château Barrière, an example of the fortified houses formerly common there. Two of its towers date from the 3rd or 4th century, and formed part of the fortified enceinte; the highest tower is of the 10th century; and the part now inhabited is of the 11th or 12th century, and was formerly used as a burial chapel. The bulk of the château is of the 12th, and some of the windows of the 16th century.

The chief medieval building in the *cité* is the church of St Etienne, once the cathedral. It dates from the 11th and 12th centuries, but suffered much injury at the hands of the Protestants in the religious wars when the tower and two of the three cupolas were destroyed. The choir and its cupola were skilfully restored in the 17th century. A fine carved wooden reredos of the 17th century and a tomb of a bishop of the 12th century are to be seen in the interior. In the medieval town, known as Le Puy-St-Front, the most remarkable building is the cathedral of St Front, which, till its restoration, or rather rebuilding, in the latter half of the 19th century when the old features were to a great extent lost, was of unique architectural value. It bears a striking resemblance to the Byzantine churches and to St Mark's at Venice, and according to one theory was built from 984 to 1047, contemporaneously with the latter (977–1085). It consists of five great cupolas, arranged in the form of a Greek cross, and conspicuous from the outside. The arms of the cross are 69 ft. in width, and the whole is 184 ft. long. These cupolas, 89 ft. high from the keystone to the ground, are supported on a vaulted roof with pointed arches after the manner characteristic of Byzantine architecture. The pointed arches imitated from it prepared the way for the introduction of the Gothic style. Adjoining St Front on the west are the remains of an old basilica of the 6th century, above which rises the belfry, the only one in the Byzantine style now extant. It dates from the 11th century, and is composed of two massive cubes, placed the one above the other in retreat, with a circular colonnade surmounted by a dome. To the south-west of St Front, the buildings of an old abbey (11th to 16th century) surround a cloister dating chiefly from the 13th century. Of the fortifications of Puy St Front, the chief relic is the Tour Mataguerre (14th century).

Périgueux is seat of a bishop, prefect and court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce and a branch of the Bank of France. Its educational establishments include a lycée for boys, training colleges for both sexes and a school of drawing. The trade of the town is in pigs, truffles, flour, brandy, poultry and pies known as *pâtés de Périgord*.

Vesunna was the capital of the Petrocorii, allies of Vercingetorix when Caesar invaded Gaul. The country was afterwards occupied by the Romans, who built a second city of Vesunna on the right bank of the Isle opposite the site of the Gallic town. The barbarian invasion brought this prosperity to a close. St Front preached Christianity here in the 4th century and over his tomb there was raised a monastery, which became the centre of the new town called Le Puy St Front. The *cité* was pillaged by the Saracens about 731, and in 844 the Normans devastated both quarters. The new town soon began to rival the old city in importance, and it was not until 1240 that the attempts of the counts of Périgord and the bishops to infringe on their municipal privileges brought about a treaty of union. During the Hundred Years' War, Périgueux was twice attacked by the English, who took the *cité* in 1356; and the whole town was ceded to them by the Treaty of Brétigny, but returned to the French Crown in the reign of Charles V. The county passed by marriage into the hands of Anthony of Bourbon, father of Henry IV., and was converted by the latter into royal domain. During the Huguenot wars Périgueux was frequently a stronghold of the Calvinists, who in 1575 did great destruction there, and it also suffered during the troubles of the Fronde.

PERIHELION (Gr. περί, near, ἥλιος, sun), in astronomy, the point of nearest approach of a body to the sun. (See ORBIT.)

PERIM, a British island in the strait of Bab-el-Mandeb, at the entrance to the Red Sea, and 96 m. W. by S. of Aden. Perim is 2 m. from the Arabian shore, is about 3½ m. long with an average breadth of over a mile, and covers some 7 sq. m. There is a good harbour with easy entrance on the south side with a depth of water from 25 to 30 ft. It is largely used by mercantile vessels as a coaling-station and for taking in stores, including fresh water and ice. Perim, the Diodoros island of the *Periplus*, was, in consequence of the French occupation of Egypt, garrisoned from 1799 to 1801 by a British force. In view of the construction of the Suez Canal and the increasing importance of the Red Sea route to India the island was annexed to Great Britain in 1857, fortified and placed under the charge of the Aden residency. In 1861 a lighthouse was built at its eastern end. Submarine cables connect the island with Aden, Egypt and Zanzibar. Population, including a garrison of 50 sepoys, about 200.

PERINO DEL VAGA (1500–1547), a painter of the Roman school, whose true name was PERINO (or PIERO) BUONACCORSI. He was born near Florence on the 28th of June 1500. His father ruined himself by gambling, and became a soldier in the invading army of Charles VIII. His mother dying when he was but two months old, he was suckled by a she-goat; but shortly afterwards he was taken up by his father's second wife. Perino was first apprenticed to a druggist, but soon passed into the hands of a mediocre painter, Andrea da Ceri, and, when eleven years of age, of Ridolfo Ghirlandajo. Perino rapidly surpassed his fellow-pupils, applying himself especially to the study of Michelangelo's great cartoon. Another mediocre painter, Vaga from Toscanella, undertook to settle the boy in Rome, but first set him to work in Toscanella. Perino, when he at last reached Rome, was utterly poor, and with no clear prospect beyond journey-work for trading decorators. He, however, studied with great severity and spirit from Michelangelo and the antique, and was eventually entrusted with some of the subordinate work undertaken by Raphael in the Vatican. He assisted Giovanni da Udine in the stucco and arabesque decorations of the loggie of the Vatican, and executed some of those small but finely composed scriptural subjects which go by the name of "Raphael's Bible"—Raphael himself furnishing the designs. Perino's examples are: "Abraham about to sacrifice Isaac," "Jacob wrestling with the Angel," "Joseph and his Brethren," the "Hebrews crossing the Jordan," the "Fall and Capture of Jericho," "Joshua commanding the Sun to stand still," the "Birth of Christ," "His Baptism" and the "Last Supper." Some of these are in bronze-tint, while others are in full colour. He also painted, after Raphael's drawings, the figures of the planets in the great hall of the Appartamenti Borgia. Perino exhibited very uncommon faculty in these works and was soon regarded as second only to Giulio Romano among the great painter's assistants. To Raphael himself he was always exceedingly respectful and attentive, and the master loved him almost as a son. He executed many other works about Rome, always displaying a certain mixture of the Florentine with the Roman style.

After Raphael's death in 1520 a troublous period ensued for Perino, with a plague which ravaged Rome in 1523, and again with the sack of that city in 1527. Then he accepted an invitation to Genoa, where he was employed in decorating the Doria Palace, and rapidly founded a quasi-Roman school of art in the Ligurian city. He ornamented the palace in a style similar to that of Giulio Romano in the Mantuan Palazzo del Tè, and frescoed historical and mythological subjects in the apartments, fanciful and graceful arabesque work, sculptural and architectural details—in short, whatever came to hand. Among the principal works are: the "War between the Gods and Giants," "Horatius Cocles defending the Bridge," and the "Fortitude

in the latter class was the *Lady's Magazine* (1792) of Philadelphia. The *Lowell Offering* (1841) was written chiefly by factory girls. *Godey's Ladies' Book* was long popular. Children's magazines originated with the *Young Misses' Magazine* (1806) of Brooklyn; another example is the *Child's Paper* (1852). Current representatives of this class are the New York *St Nicholas* and the Boston *Youth's Companion*, both monthlies.

The number of periodicals and serials now appearing in the United States and Canada is very large. The total mentioned in the *Guide* by H. O. Severance and C. H. Walsh (1909, Anne Arbor), is 5136 for the year 1908.

AUTHORITIES.—The eighth volume of the *Tenth Report of the United States Census* (1884) contains a statistical report on the newspaper and periodical press of America by S. N. D. North. See also Cucheval Clarigny, *Histoire de la presse en Angleterre et aux États Unis* (1857); H. Stevens, *Catalogue of American Books in the Library of the British Museum* (1866), and *American Books with Tails to 'em* (1873); I. Thomas, *History of Printing in America* (Albany, 1874); J. Nichol, *American Literature* (1882); "Check List of American Magazines," in *Library Journ.*, xiv. 373; G. P. Rowell & Co.'s *American Newspaper Directory* (New York); A. R. Spofford, *Book for all Readers* (1900); F. W. Faxon's *Check List of American and English Periodicals* (Boston, 1908). Many American libraries co-operate in issuing joint or union lists of periodicals. See list of these as well as lists of special indexes in A. B. Kroeger's *Guide to Reference Books* (2nd. ed., Boston, 1908).

Indexes to Periodicals.—The contents of English and American periodicals of the last 100 years are indexed in the following publications: W. F. Poole's *Index to Periodical Literature* (1802–1881, revised ed., Boston, 1891); 1st supplement, 1882–1887, by W. F. Poole and W. I. Fletcher, 1888; 2nd supplement, 1887–1892, by W. I. Fletcher, 1893; 3rd supplement, 1892–1896, by W. I. Fletcher and F. O. Poole, 1898; 4th supplement, 1897–1902, 1902; 5th supplement, 1902–1907, 1908; *Poole's Index*, abridged edition, by W. I. Fletcher and M. Poole (Boston, 1901); 1st supplement, 1900–1904 (Boston, 1905); *The Co-operative Index to Periodicals* (1885–1894, ed. W. I. Fletcher, 1886–1894); *The Annual Literary Index, including Periodicals*, ed. by W. I. Fletcher and R. R. Bowker (New York, 10 vols., 1892–1907); "Index of Periodicals for 1890," &c. (*Review of Reviews*), by Miss Hetherington (13 vols., 1891–1902); *Q. P. Indexes*; Cotgreave's *Contents Subject Index to General and Periodical Literature* (1900); *Cumulative Index to a Selected list of Periodicals*, begun in the Cleveland Public Library in 1896 and 1897 by W. H. Brett, merged in 1903 with the *Reader's Guide to Periodical Literature* (8 vols., 1901–1908, ed. by A. L. Guthrie, Minnesota, U.S.); *Magazine Subject Index*, by F. W. Faxon (Boston, 1908), continued quarterly in *Bulletin of Bibliography*, which in 1907 began a magazine subject index; *Eclectic Library Catalogue* (Minn U.S., 1908), issued quarterly.

CANADA

Canadian periodicals have reached a higher standard than in any other British self-governing colony. Like that of South Africa, the press is bi-lingual. The first Canadian review, the *Quebec Magazine* (1791–1793), was published quarterly in French and English. It was followed by the *British American Register* (Quebec, 1803), *L'Abeille canadienne* (Montreal, 1818), edited by H. Mezière, the *Canadian Magazine* (Montreal, 1823–1825), the *Canadian Review* (Montreal, 1824–1826), *La Bibliothèque canadienne* (Montreal, 1825–1830), continued as *L'Observateur* (1830–1831), and the *Magasin du Bas-Canada* (Montreal, 1832). The three latter were edited by Michel Bibaud. The *Literary Garland* (Montreal, 1838–1850), edited by John Gibson, was for some time the only English magazine published in Canada. Later magazines were *L'Echo du cabinet du lecture paroissial* (Montreal, 1859), 15 vols.; *Le Foyer canadien* (Quebec, 1863–1866), one of the most interesting French-Canadian reviews; *La Revue canadienne*, which was started at Montreal in 1864, and contained the best writings of contemporary French-Canadian littérateurs; *La Revue de Montréal* (1877–1881), edited by the abbé T. A. Chandonnet; the *Canadian Journal* (Toronto), commenced in 1852 under Henry Youle Hind and continued by Daniel Wilson; *L'Abeille* (Quebec, 1848–1881), and the *Canadian Monthly* (Toronto, 1872–1882). The *Bystander* (Toronto, 1880–1883), was edited by Goldwin Smith. *Le Canada français* (Quebec, 1888–1891), edited by the staff of the Laval University, and *Canadiana* (1889–1890), were important historical and literary reviews. Contemporary magazines are the *Canadian Magazine* (1893), the *Westminster*, both produced at Toronto, *La Nouvelle-France* (Quebec), the *Canada Monthly* (London, Ontario), and the *University Magazine*, edited by Professor Macphail, of the McGill University.

See H. J. Morgan, *Bibliotheca canadensis* (1867), "Canadian Magazines," by G. Stewart, *Canadian Monthly*, vol. xvii.; "Periodical Literature in Canada," by J. M. Oxley, *North Am. Rev.* (1888); P. Gagnon, *Essai de bibliographie canadienne* (1895), and S. E. Dawson, *Prose Writers of Canada* (1901).

SOUTH AFRICA

The earliest magazine was the *South African Journal*, issued by the poet Pringle and John Fairbairn in 1824. It was followed by the *South African Quarterly Journal* (1829–1834), the *Cape of Good Hope Literary Gazette* (1830–1833), edited by A. J. Jardine, the *Cape of Good Hope Literary Magazine* (1847–1848), edited by J. L. Fitzpatrick, and the *Eastern Province Monthly Magazine*, published at Grahamstown in 1857–1858. A Dutch periodical called *Elpis, algemeen tijdschrift voor Zuid Afrika* (1857–1861) appealed to the farming community. The *Eastern Province Magazine* was issued at Port Elizabeth in 1861–1862, and the *South African Magazine* appeared in 1867–1868. The *Orange Free State Magazine*, the only English magazine published at Bloemfontein, was issued in 1877–1878; and the *E. P. Magazine* was published at Grahamstown in 1892–1897. The *Cape Monthly Magazine*, the most important of the periodicals, was issued from 1857 to 1862, and was again continued under the editorship of Professor Noble from 1870 to 1881. The *Cape Illustrated Magazine* (1890–1899) was edited by Professor J. Gill. In Durban the *Present Century* was started in 1903, and the *Natal Magazine* was issued at Pietermaritzburg in 1877. The weekly *New Era* (1904–1905) was succeeded by the *South African Magazine* (1906–1907); both were edited by C. H. Crane. The *African Monthly* (Grahamstown, 1907) and the *State of South Africa* (Cape Town, 1909) are monthly reviews, while the *South African Railway Magazine* (1907) is of wider interest than its name denotes.

See S. Mendelssohn, *South African Bibliography* (2 vols., 1910); and P. E. Lewin, *Catalogue of the Port Elizabeth Library* (2 vols., 1906).

AUSTRALIA AND NEW ZEALAND

New South Wales.—The *Australian Magazine* was published monthly at Sydney in 1821–1822. This was followed by the *South Asian Register* (1827), the *Australian Quarterly Journal* (1828), edited by the Rev. P. N. Wilton, the *New South Wales Magazine* (1833), the *New South Wales Literary, Political and Commercial Advertiser* (1835), edited by the eccentric Dr Lhotsky, *Tegg's Monthly Magazine* (1836), the *Australian Magazine* (1838), the *New South Wales Magazine* (1843), the *Australian Penny Journal* (1848) and many others. The *Sydney University Magazine* (1855), again published in 1878–1879, and continued as the *Sydney University Review*, is the first magazine of a high literary standard. The *Sydney Magazine of Science and Art* (1857) and the *Month* (1857) were short-lived. Of later magazines the *Australian* (1878–1881), *Aurora australis* (1868), and the *Sydney Magazine* (1878), were the most noteworthy. Of contemporary magazines *Dalgety's Review* is mainly agricultural, the *Australian Magazine* (1909) and the *Lone Hand* (1907) are popular, and the *Science of Man* is an anthropological review.

See *Australasian Bibliography* (Sydney, 1893); G. B. Barton, *Literature of N. S. W.* (1866); E. A. Petherick, *Catalogue of Books Relating to Australasia* (1899).

Victoria.—The *Port Phillip Magazine* (1843) must be regarded as the first literary venture in Victoria. This was followed by the *Australia Felix Magazine* (1849), and the *Australasian Quarterly Reprint* (1850–1851) both published at Geelong, the *Illustrated Australian Magazine* (1850–1852), the *Australian Gold-Digger's Monthly Magazine* (1852–1853), edited by James Bonwick, and the *Melbourne Monthly Magazine* (1855–1856). The *Journal of Australasia* (1856–1858), the *Australian Monthly Magazine* (1865–1867), which contained contributions from Marcus Clarke and was continued as the *Colonial Monthly* (1867–1869), the *Melbourne Review* (1876–1885) and the *Victorian Review* (1879–1886) may also be mentioned. The *Imperial Review*, apparently the work of one pen, has been published since 1879; the *Pastoralists' Review* appeals more especially to the agricultural community. A *Library Record of Australasia* was published in 1901–1902. An Australian edition of the *Review of Reviews* is published at Melbourne.

See "Some Magazines of Early Victoria," in the *Library Record of Australasia*, Nos. 2–4 (1901).

South Australia.—The *South Australian Magazine* was issued monthly in 1841–1843, the *Adelaide Magazine* (1845), the *Adelaide Miscellany* (1848–1849), and the *Wanderer* in 1853. The *South Australian Twopenny Magazine* was published at Plymouth, England, in 1839, and the *South Australian Miscellany and New Zealand Review* at London in the same year.

See T. Gill, *Bibliography of South Australia* (1886).

Tasmania.—The first magazine was Murray's *Austral-Asiatic Review*, published at Hobart in 1828. The *Hobart Town Magazine* appeared in 1833–1834, and the *Van Diemen's Land Monthly Magazine* in 1835.

New Zealand.—The *New Zealand Magazine*, a quarterly, was published at Wellington in 1850. In 1857 appeared the *New Zealand Quarterly Review*, of little local interest, followed by *Chapman's New Zealand Monthly Magazine* (1862), the *Southern Monthly Magazine* (1863), the *Delphic Oracle* (1866–1870), the *Stoic* (1871), the *Dunedin Review* (1885), the *Literary Magazine* (1885), the four latter being written by J. G. S. Grant, an eccentric genius, the *Monthly Review* (1888–1890), the *New Zealand Illustrated Magazine* (1899–1905), chiefly devoted to the light literature of New Zealand subjects, the *Maori Record* (1905–1907), and the *Red Funnel*, published since 1905.

See T. M. Hocken, *Bibliography of New Zealand* (1909).

WEST INDIES AND BRITISH CROWN COLONIES

In Jamaica the *Columbian Magazine* was founded at Kingston in 1796 and ceased publication in 1800. Two volumes were

published of a *New Jamaica Magazine* which was started about 1798. The *Jamaica Magazine* (1812–1813), the *Jamaica Monthly Magazine* (1844–1848), and the *Victoria Quarterly* (1889–1892), which contained many valuable articles on the West Indies, were other magazines. The *West Indian Quarterly* was published at Georgetown, British Guiana, from 1885 to 1888. At Georgetown was also published the well-known *Timehri* (1882–1898) which contained many important historical articles. In Trinidad the *Trinidad Monthly Magazine* was started in 1871, and the *Union Magazine* in 1892.

Malta had a *Malta Penny Magazine* in 1839–1841, and the *Revue historique et littéraire* was founded in Mauritius in 1887. Many magazines dealing with the colonies have been published in England, such as the *Colonial Magazine* (1840–1843).

See F. Cundall, *Bibliographia Jamaicensis* (1902–1908).

India and Ceylon

Calcutta.—The first Indian periodical was the *Asiatick Miscellany* (Calcutta, 1785–1789), probably edited by F. Gladwin. The *Calcutta Monthly Register* was published in 1790, and the *Calcutta Monthly Journal* from 1798 to 1841. Among other early Calcutta magazines were the *Asiatic Observer* (1823–1824), the *Quarterly Oriental Magazine* (1824–1827), and the *Royal Sporting Magazine* (1833–1838). The *Calcutta Literary Gazette* was published in 1830–1834, and the *Calcutta Review*, still the most important serial of the Indian Empire, first appeared in 1846 under the editorship of Sir J. W. Kaye.

Bombay.—The *Bombay Magazine* was started in 1811 and lasted but a short time. The *Bombay Quarterly Magazine* (1851–1853) gave place to the *Bombay Quarterly Review*, issued in 1855.

Madras.—Madras had a *Journal of Literature and Science* and the *Oriental Magazine and Indian Hurkuru* (1819). The *Indian Antiquary* was started at Bombay in 1872 and still continues. Of other contemporary magazines the *Hindustan Review* (Allahabad), the *Modern Review* (Calcutta), the *Indian Review* (Madras), the *Madras Review*, a quarterly first published in 1895, and the *Calcutta University Magazine* (1894), are important.

Ceylon.—In Ceylon the *Religious and Theological Magazine* was started at Colombo in 1833, the *Colombo Magazine* in 1839, the *Ceylon Magazine* in 1840, and the *Investigator* at Kandy in 1841. Of contemporary magazines the *Tropical Agriculturist* was started in 1881, the *Ceylon Literary Register* (1886–1896), afterwards the *Monthly Literary Register* and the *Ceylon National Review* in 1893. In Burma the quarterly *Buddhism* appeared in 1904. Singapore had a *Journal of the Indian Archipelago* from 1847 to 1859, and the *Chinese Repository* (1832–1851) was edited at Canton by Morrison.

See "Periodical Literature in India," in *Dark Blue* (1872–1873).

France

We owe the literary journal to France, where it soon attained to a degree of importance unapproached in any other country. The first idea may be traced in the *Bureau d'adresse* (1633–1642) of Théophraste Renaudot, giving the proceedings of his conferences upon literary and scientific matters. About the year 1663 Mézeray obtained a privilege for a regular literary periodical, which came to nothing, and it was left to Denis de Sallo, counsellor of the parliament of Paris and a man of rare merit and learning, to actually carry the project into effect. The first number of the *Journal des savants* appeared on the 5th of January 1665, under the assumed name of the sieur d'Hédouville. The prospectus promised to give an account of the chief books published throughout Europe, obituary notices, a review of the progress of science, besides legal and ecclesiastical information and other matters of interest to cultivated persons. The criticisms, however, wounded alike authors and the clergy, and the journal was suppressed after a career of three months. Colbert, seeing the public utility of such a periodical, ordered the abbé Gallois, a contributor of De Sallo's, to re-establish it, an event which took place on the 4th of January 1666. It lingered nine years under the new editor, who was replaced in 1675 by the abbé de la Roque, and the latter in his turn by the president Cousin, in 1686. From 1701 commenced a new era for the *Journal*, which was then acquired by the chancellor de Pontchartrain for the state and placed under the direction of a commission of learned men. Just before the Revolution it developed fresh activity, but the troubles of 1792 caused it to be discontinued until 1796, when it again failed to appear after twelve numbers had been issued. In 1816 it was definitely re-established and replaced under government patronage, remaining subject to the chancellor or garde-des-sceaux until 1857, when it was transferred to the control of the minister of public instruction. Since 1903 the organization of the publication has changed. The state subsidy having been withdrawn, the Institute voted a yearly subscription of 10,000 francs and nominated a commission of five members, one for each section, who managed the *Journal*. Since 1909, however, the various sections have left to the Académie des Inscriptions et Belles Lettres the entire direction of the *Journal*, while still paying the annual subsidy. It now restricts itself to publishing contributions relating to antiquities and the middle ages and Oriental studies.

Louis Auguste de Bourbon, sovereign prince of Dombes, having transferred his parliament to Trévoux, set up a printing press, and was persuaded by two Jesuits, Michel le Tellier and Philippe Lallemant, to establish the *Mémoires pour servir à l'histoire des sciences et des arts* (1701–1767), more familiarly known as the *Journal des Trévoux*, long the best-informed and best-written journal in France. One feature of its career was its constant appeal for the literary assistance of outsiders. It was continued in a more popular style as *Journal des sciences et des beaux-arts* (1768–1775) by the abbé Aubert and by the brothers Castilhon (1776–1778), and as *Journal de littérature, des sciences, et des arts* (1779–1782) by the abbé Grosier.

The first legal periodical was the *Journal du palais* (1672) of Claude Blondeau and Gabriel Guéret, and the first devoted to medicine the *Nouvelles découvertes dans toutes les parties de la médecine* (1679) of Nicolas de Blégny, frequently spoken of as a charlatan, a term which sometimes means simply a man of many ideas. Religious periodicals date from 1680, and the *Journal ecclésiastique* of the abbé de la Roque, to whom is also due the first medical journal (1683). The prototype of the historico-literary periodical may be discovered in *La Clef du cabinet des princes de l'Europe* (1704–1706), familiarly known as *Journal de Verdun*, and carried on under various titles down to 1794.

Literary criticism was no more free than political discussion, and no person was allowed to trespass either upon the domain of the *Journal des savants* or that of the *Mercure de France* (see Newspapers) without the payment of heavy subsidies. This was the origin of the clandestine press of Holland, and it was that country which for the next hundred years supplied the ablest periodical criticism from the pens of French Protestant refugees. During that period thirty-one journals of the first class proceeded from these sources. From its commencement the *Journal des savants* was pirated in Holland, and for ten years a kind of joint issue made up with the *Journal des Trévoux* appeared at Amsterdam. From 1764 to 1775 miscellaneous articles from different French and English reviews were added to this reprint. Bayle, a born journalist and the most able critic of the day, conceived the plan of the *Nouvelles de la république des lettres* (1684–1718), which at once became entirely successful and obtained for him during the three years of his control the dictatorship of the world of letters. He was succeeded as editor by La Roque, Barrin, Bernard and Leclerc. Bayle's method was followed in an equally meritorious periodical, the *Histoire des ouvrages des Savants* (1687–1704) of H. Basnage de Beauval. Another continuator of Bayle was Jean Leclerc, one of the most learned and acute critics of the 18th century, who carried on three reviews—the *Bibliothèque universelle et historique* (1686–1693), the *Bibliothèque choisie* (1703–1713), and the *Bibliothèque ancienne et moderne* (1714–1727). They form one series, and, besides valuable estimates of new books, include original dissertations, articles and biographies like our modern learned magazines. The *Journal littéraire* (1713–1722, 1729–1736) was founded by a society of young men, who made it a rule to discuss their contributions in common. Specially devoted to English literature were the *Bibliothèque anglaise* (1716–1728), the *Mémoires littéraires de la Grande Bretagne* (1720–1724), the *Bibliothèque britannique* (1733–1734), and the *Journal britannique* (1750–1757) of Maty,[1] who took for his principle, "pour penser avec liberté il faut penser seul." One of these Dutch-printed reviews was *L'Europe savante* (1718–1720), founded chiefly by Themiseul de Saint-Hyacinthe, with the intention of placing each separate department under the care of a specialist. The *Bibliothèque germanique* (1720–1740) was established by Jacques Lenfant to do for northern Europe what the *Bibliothèque britannique* did for England. It was followed by the *Nouvelle bibliothèque germanique* (1746–1759). The *Bibliothèque raisonnée des ouvrages des savants* (1728–1758) was supplementary to Leclerc, and was succeeded by the *Bibliothèque des sciences et des beaux-arts* (1754–1780). Nearly all of the preceding were produced either at Amsterdam or Rotterdam, and, although out of place in a precise geographical arrangement, really belong to France by the close ties of language and of blood.

Taking up the exact chronological order again, we find the success of the English essay-papers led to their prompt introduction to the Continent. An incomplete translation of the *Spectator* was published at Amsterdam in 1714, and many volumes of extracts from the *Tatler*, *Spectator* and *Guardian* were issued in France early in the 18th century. Marivaux brought out a *Spectateur Français* (1722), which was coldly received; it was followed by fourteen or fifteen others, under the titles of *La Spectatrice* (1728–1730), *Le Radoteur* (1775), *Le Babillard* (1778–1779), &c. Of a similar character was *Le Pour et le contre* (1723–1740) of the abbé Prévost, which contained anecdotes and criticism, with special reference to Great Britain. Throughout the 18th century, in France as in England, a favourite literary method was to write of social subjects under the assumed character of a foreigner, generally an

[1] Matthew Maty, M.D., born in Holland, 1718, died principal librarian of the British Museum, 1776. He settled in England in 1740, published several books, and wrote the preface to Gibbon's first work, *Etude de la littérature.*

Oriental, with the title of *Turkish Spy*, *Lettres chinoises*, &c. These productions were usually issued in periodical form, and, besides an immense amount of worthless tittle-tattle, contain some valuable matter.

During the first half of the century France has little of importance to show in periodical literature. The *Nouvelles ecclésiastiques* (1728–1803) were first printed and circulated secretly by the Jansenists in opposition to the *Constitution unigenitus*. The Jesuits retaliated with the *Supplément des nouvelles ecclésiastiques* (1734–1748). The promising title may have had something to do with the temporary success of the *Mémoires secrets de la république des lettres* (1744–1748) of the marquis d'Argens. In the *Observations sur les écrits modernes* (1735–1743) Desfontaines held the gates of Philistia for eight years against the Encyclopaedists, and even the redoubtable Voltaire himself. It was continued by the *Jugements sur quelques ouvrages nouveaux* (1744–1745). The name of Fréron, perhaps the most vigorous enemy Voltaire ever encountered, was long connected with *Lettres sur quelques écrits de ce temps* (1749–1754), followed by *L'Année littéraire* (1754–1790). Among the contributors of Fréron was another manufacturer of criticism, the abbé de la Porte, who, having quarrelled with his *confrère*, founded *Observations sur la littérature moderne* (1749–1752) and *L'Observateur littéraire* (1758–1761).

A number of special organs came into existence about this period. The first, treating of agriculture and domestic economy, was the *Journal économique* (1751–1772); a *Journal de commerce* was founded in 1759; periodical biography may be first seen in the *Nécrologe des hommes célèbres de France* (1764–1782); the political economists established the *Éphémérides du citoyen* in 1765; the first *Journal d'éducation* was founded in 1768, and the *Courrier de la mode* in the same year; the theatre had its first organ in the *Journal des théâtres* (1770); in the same year were produced a *Journal de musique* and the *Encyclopédie militaire*; the sister service was supplied with a *Journal de marine* in 1778. We have already noticed several journals specially devoted to one or other foreign literature. It was left to Fréron, Grimm, Prévost and others in 1754 to extend the idea to all foreign productions, and the *Journal étranger* (1754–1762) was founded for this purpose. The *Gazette littéraire* (1764–1766), which had Voltaire, Diderot and Saint-Lambert among its editors, was intended to swamp the small fry of criticism; the *Journal des dames* (1759–1778) was of a light magazine class; and the *Journal de monsieur* (1776–1783) had three phases of existence, and died after extending to thirty volumes. The *Mémoires secrets pour servir à l'histoire de la république des lettres* (1762–1787), better known as *Mémoires de Bachaumont*, from the name of their founder, furnish a minute account of the social and literary history for a period of twenty-six years. Of a similar character was the *Correspondance littéraire secrète* (1774–1793), to which Métra was the chief contributor. *L'Esprit des journaux* (1772–1818) forms an important literary and historical collection, which is rarely to be found complete.

The movement of ideas at the close of the century may best be traced in the *Annales politiques, civiles, et littéraires* (1777–1792) of Linguet. The *Décade philosophique* (year V., or 1796/1797), founded by Ginguené, is the first periodical of the magazine class which appeared after the storms of the Revolution. It was a kind of resurrection of good taste; under the empire it formed the sole refuge of the opposition. By a decree of the 17th of January 1800 the consulate reduced the number of Parisian journals to thirteen, of which the *Décade* was one; all the others, with the exception of those dealing solely with science, art, commerce and advertisements, were suppressed. A report addressed to Bonaparte by Fiévée[1] in the year XI. (1802/1803) furnishes a list of fifty-one of these periodicals. In the year XIII. (1804/1805) only seven non-political serials were permitted to appear.

Between 1815 and 1819 there was a constant struggle between freedom of thought on the one hand and the censure, the police and the law officers on the other. This oppression led to the device of "semi-periodical" publications, of which *La Minerve française* (1818–1820) is an instance. It was the *Satire Ménippée* of the Restoration, and was brought out four times a year at irregular intervals. Of the same class was the *Bibliothèque historique* (1818–1820), another anti-royalist organ. The censure was re-established in 1820 and abolished in 1828 with the monopoly. It has always seemed impossible to carry on successfully in France a review upon the lines of those which have become so numerous and important in England. The *Revue britannique* (1825–1901) had, however, a long career. The short-lived *Revue française* (1828–1830), founded by Guizot, Rémusat, De Broglie, and the *doctrinaires*, was an attempt in this direction. The well-known *Revue des deux mondes* was established in 1829 by Ségur-Dupeyron and Mauroy, but it ceased to appear at the end of the year, and its actual existence dates from its acquisition in 1831 by François Buloz,[2] a masterful editor, under whose energetic management it soon achieved a world-wide reputation. The most distinguished names in French literature have been among its contributors, for whom it has been styled the "vestibule of the Academy." It was preceded by a few months by the *Revue de Paris* (1829–1845), founded by Véron, who introduced the novel to periodical literature. In 1834 this was purchased by Buloz, and brought out concurrently with his other *Revue*. While the former was exclusively literary and artistic, the latter dealt more with philosophy. The *Revue indépendante* (1841–1848) was founded by Pierre Leroux, George Sand and Viardot for the democracy. The times of the consulate and the empire were the subjects dealt with by the *Revue de l'empire* (1842–1848). In *Le Correspondant* (1843), established by Montalembert and De Falloux, the Catholics and Legitimists had a valuable supporter. The *Revue contemporaine* (1852), founded by the comte de Belval as a royalist organ, had joined to it in 1856 the *Athenaeum français*. The *Revue germanique* (1858) exchanged its exclusive name and character in 1865 to the *Revue moderne*. The *Revue européenne* (1859) was at first subventioned like the *Revue contemporaine*, from which it soon withdrew government favour. The *Revue nationale* (1860) appeared quarterly, and succeeded to the *Magazin de librairie* (1858).

The number of French periodicals, reviews and magazines has enormously increased, not only in Paris but in the provinces. In Paris the number of periodicals published in 1883 was 1379; at the end of 1908 there were more than 3500 of all kinds. The chief current periodicals may be mentioned in the following order. The list includes a few no longer published.

Archaeology.—*Revue archéologique* (1860), bi-monthly; *Ami des monuments* (1887); *Bulletin de numismatique* (1891); *Revue biblique* (1892); *L'Année épigraphique* (1880)—a sort of supplement to the *Corpus inscriptionum latinarum*; *Celtica* (1903)—common to France and England; *Gazette numismatique française* (1897); *Revue sémitique d'épigraphie et d'histoire ancienne* (1893); *Bulletin monumental*, bi-monthly; *L'Intermédiaire*, weekly, the French "Notes and Queries," devoted to literary and antiquarian questions.

Astronomy.—*Annuaire astronomique et météorologique* (1901); *Bulletin astronomique* (1884), formerly published under the title *Bulletin des sciences mathématiques et astronomiques*.

Bibliography.—*Annales de bibliographie théologique* (1888); *Le bibliographe moderne* (1897); *Bibliographie anatomique* (1893); *Bibliographie scientifique française* (1902); *Bulletin des bibliothèques et des archives* (1884); *Bulletin des livres relatifs à l'Amérique* (1899); *Courrier des bibliothèques* (1910); *Répertoire méthodique de l'histoire moderne et contemporaine de la France* (1898); *Répertoire méthodique du moyen âge français* (1894); *Revue bibliographique et critique des langues et littératures romanes* (1889); *Revue des bibliothèques* (1891); *Polybiblion: revue bibliographique universelle*, monthly; *Revue générale de bibliographie française*, bi-monthly.

Children's Magazines.—*L'Ami de la jeunesse; Le Jeudi de la jeunesse*, weekly.

Fashions.—*La Mode illustrée*; *Les Modes*, monthly.

Fine Arts.—*Les Arts* (1902); *Gazette des beaux-arts* (1859), monthly, with *Chronique des arts*; *Revue de l'art ancien et moderne* (1897) monthly; *L'Art décoratif*, monthly, *Art et décoration*, monthly; *L'Art pour tous*, monthly; *La Décoration*, monthly; *L'Architecture*—journal of the Soc. centrale des Architectes français, weekly; *L'Art* (1875) is no longer published.

Geography and Colonies.—*Bulletin de géographie historique*; *Annales de géographie* (1891), with useful quarterly bibliography; *Nouvelles géographiques*—supplement to the *Tour du monde* (1891); *La Vie coloniale* (1902); *La Géographie*, monthly, published by the Soc. de Géographie (1900); *Revue de géographie*, monthly; *Revue géographique internationale*, monthly.

History.—For long the chief organs for history and archaeology were the *Bibliothèque de l'école des chartes* (1835), appearing every two months and dealing with the middle ages, and the *Cabinet historique* (1855), a monthly devoted to MSS. and unprinted documents. The *Revue historique* (1876) appears bi-monthly; there is also the *Revue d'histoire moderne et contemporaine*.

Law and Jurisprudence.—*Annales de droit commercial* (1877); *Revue algérienne et tunisienne de législation et de jurisprudence* (1885); *Revue du droit public et de la science politique* (1894); *Revue générale du droit international public* (1894).

Literary Reviews.—The *Revue des deux mondes* and the *Correspondant* have already been mentioned. One of the first of European weekly reviews is the *Revue critique* (1866). The *Revue politique et littéraire*, successor to the *Revue des cours littéraires* (1863) and known as the *Revue bleue*, also appears weekly. Others of interest are: *Antée, revue mensuelle de littérature* (1904); *L'Art et la vie* (1892); *Cosmopolis* (1896); *L'Ermitage* (1890); *Le Mercure de France*, série moderne (1890), a magazine greatly valued in literary circles; *La Revue de Paris*, fortnightly (1894), and the *Nouvelle Revue* (1879)—

[1] The novelist and publicist Joseph Fiévée (1767–1839), known for his relations with Napoleon I., has been made the subject for a study by Sainte-Beuve (*Causeries*, v. 172).

[2] This remarkable man (1804–1877) began life as a shepherd. Educated through the charity of M. Naville, he came to Paris as a compositor, and by translating from the English earned sufficient to purchase the moribund *Revue des deux mondes*, which acquired its subsequent position in spite of the tyrannical editorial behaviour of the proprietor. Buloz is said to have eventually enjoyed an income of 365,000 francs from the *Revue*.

published of a *New Jamaica Magazine* which was started about 1798. The *Jamaica Magazine* (1812–1813), the *Jamaica Monthly Magazine* (1844–1848), and the *Victoria Quarterly* (1889–1892), which contained many valuable articles on the West Indies, were other magazines. The *West Indian Quarterly* was published at Georgetown, British Guiana, from 1885 to 1888. At Georgetown was also published the well-known *Timehri* (1882–1898) which contained many important historical articles. In Trinidad the *Trinidad Monthly Magazine* was started in 1871, and the *Union Magazine* in 1892.

Malta had a *Malta Penny Magazine* in 1839–1841, and the *Revue historique et littéraire* was founded in Mauritius in 1887. Many magazines dealing with the colonies have been published in England, such as the *Colonial Magazine* (1840–1843).

See F. Cundall, *Bibliographia Jamaicensis* (1902–1908).

India and Ceylon

Calcutta.—The first Indian periodical was the *Asiatick Miscellany* (Calcutta, 1785–1789), probably edited by F. Gladwin. The *Calcutta Monthly Register* was published in 1790, and the *Calcutta Monthly Journal* from 1798 to 1841. Among other early Calcutta magazines were the *Asiatic Observer* (1823–1824), the *Quarterly Oriental Magazine* (1824–1827), and the *Royal Sporting Magazine* (1833–1838). The *Calcutta Literary Gazette* was published in 1830–1834, and the *Calcutta Review*, still the most important serial of the Indian Empire, first appeared in 1846 under the editorship of Sir J. W. Kaye.

Bombay.—The *Bombay Magazine* was started in 1811 and lasted but a short time. The *Bombay Quarterly Magazine* (1851–1853) gave place to the *Bombay Quarterly Review*, issued in 1855.

Madras.—Madras had a *Journal of Literature and Science* and the *Oriental Magazine and Indian Hurkuru* (1819). The *Indian Antiquary* was started at Bombay in 1872 and still continues. Of other contemporary magazines the *Hindustan Review* (Allahabad), the *Modern Review* (Calcutta), the *Indian Review* (Madras), the *Madras Review*, a quarterly first published in 1895, and the *Calcutta University Magazine* (1894), are important.

Ceylon.—In Ceylon the *Religious and Theological Magazine* was started at Colombo in 1833, the *Colombo Magazine* in 1839, the *Ceylon Magazine* in 1840, and the *Investigator* at Kandy in 1841. Of contemporary magazines the *Tropical Agriculturist* was started in 1881, the *Ceylon Literary Register* (1886–1896), afterwards the *Monthly Literary Register* and the *Ceylon National Review* in 1893. In Burma the quarterly *Buddhism* appeared in 1904. Singapore had a *Journal of the Indian Archipelago* from 1847 to 1859, and the *Chinese Repository* (1832–1851) was edited at Canton by Morrison.

See "Periodical Literature in India," in *Dark Blue* (1872–1873).

France

We owe the literary journal to France, where it soon attained to a degree of importance unapproached in any other country. The first idea may be traced in the *Bureau d'adresse* (1633–1642) of Théophraste Renaudot, giving the proceedings of his conferences upon literary and scientific matters. About the year 1663 Mézeray obtained a privilege for a regular literary periodical, which came to nothing, and it was left to Denis de Sallo, counsellor of the parliament of Paris and a man of rare merit and learning, to actually carry the project into effect. The first number of the *Journal des savants* appeared on the 5th of January 1665, under the assumed name of the sieur d'Hédouville. The prospectus promised to give an account of the chief books published throughout Europe, obituary notices, a review of the progress of science, besides legal and ecclesiastical information and other matters of interest to cultivated persons. The criticisms, however, wounded alike authors and the clergy, and the journal was suppressed after a career of three months. Colbert, seeing the public utility of such a periodical, ordered the abbé Gallois, a contributor of De Sallo's, to re-establish it, an event which took place on the 4th of January 1666. It lingered nine years under the new editor, who was replaced in 1675 by the abbé de la Roque, and the latter in his turn by the president Cousin, in 1686. From 1701 commenced a new era for the *Journal*, which was then acquired by the chancellor de Pontchartrain for the state and placed under the direction of a commission of learned men. Just before the Revolution it developed fresh activity, but the troubles of 1792 caused it to be discontinued until 1796, when it again failed to appear after twelve numbers had been issued. In 1816 it was definitely re-established and replaced under government patronage, remaining subject to the chancellor or garde-des-sceaux until 1857, when it was transferred to the control of the minister of public instruction. Since 1903 the organization of the publication has changed. The state subsidy having been withdrawn, the Institute voted a yearly subscription of 10,000 francs and nominated a commission of five members, one for each section, who managed the *Journal*. Since 1909, however, the various sections have left to the Académie des Inscriptions et Belles Lettres the entire direction of the *Journal*, while still paying the annual subsidy. It now restricts itself to publishing contributions relating to antiquities and the middle ages and Oriental studies.

Louis Auguste de Bourbon, sovereign prince of Dombes, having transferred his parliament to Trévoux, set up a printing press, and was persuaded by two Jesuits, Michel le Tellier and Philippe Lallemant, to establish the *Mémoires pour servir à l'histoire des sciences et des arts* (1701–1767), more familiarly known as the *Journal des Trévoux*, long the best-informed and best-written journal in France. One feature of its career was its constant appeal for the literary assistance of outsiders. It was continued in a more popular style as *Journal des sciences et des beaux-arts* (1768–1775) by the abbé Aubert and by the brothers Castilhon (1776–1778), and as *Journal de littérature, des sciences, et des arts* (1779–1782) by the abbé Grosier.

The first legal periodical was the *Journal du palais* (1672) of Claude Blondeau and Gabriel Guéret, and the first devoted to medicine the *Nouvelles découvertes dans toutes les parties de la médecine* (1679) of Nicolas de Blégny, frequently spoken of as a charlatan, a term which sometimes means simply a man of many ideas. Religious periodicals date from 1680, and the *Journal ecclésiastique* of the abbé de la Roque, to whom is also due the first medical journal (1683). The prototype of the historico-literary periodical may be discovered in *La Clef du cabinet des princes de l'Europe* (1704–1706), familiarly known as *Journal de Verdun*, and carried on under various titles down to 1794.

Literary criticism was no more free than political discussion, and no person was allowed to trespass either upon the domain of the *Journal des savants* or that of the *Mercure de France* (see Newspapers) without the payment of heavy subsidies. Thus was the origin of the clandestine press of Holland, and it was that country which for the next hundred years supplied the ablest periodical criticism from the pens of French Protestant refugees. During that period thirty-one journals of the first class proceeded from these sources. From its commencement the *Journal des savants* was pirated in Holland, and for ten years a kind of joint issue made up with the *Journal des Trévoux* appeared at Amsterdam. From 1764 to 1775 miscellaneous articles from different French and English reviews were added to this reprint. Bayle, a born journalist and the most able critic of the day, conceived the plan of the *Nouvelles de la république des lettres* (1684–1718), which at once became entirely successful and obtained for him during the three years of his control the dictatorship of the world of letters. He was succeeded as editor by La Roque, Barrin, Bernard and Leclerc. Bayle's method was followed in an equally meritorious periodical, the *Histoire des ouvrages des Savants* (1687–1704) of H. Basnage de Beauval. Another continuator of Bayle was Jean Leclerc, one of the most learned and acute critics of the 18th century, who carried on three reviews—the *Bibliothèque universelle et historique* (1686–1693), the *Bibliothèque choisie* (1703–1713), and the *Bibliothèque ancienne et moderne* (1714–1727). They form one series, and, besides valuable estimates of new books, include original dissertations, articles and biographies like our modern learned magazines. The *Journal littéraire* (1713–1722, 1729–1736) was founded by a society of young men, who made it a rule to discuss their contributions in common. Specially devoted to English literature were the *Bibliothèque anglaise* (1716–1728), the *Mémoires littéraires de la Grande Bretagne* (1720–1724), the *Bibliothèque britannique* (1733–1734), and the *Journal britannique* (1750–1757) of Maty,[1] who took for his principle, "pour penser avec liberté il faut penser seul." One of these Dutch-printed reviews was *L'Europe savante* (1718–1720), founded chiefly by Themiseul de Saint-Hyacinthe, with the intention of placing each separate department under the care of a specialist. The *Bibliothèque germanique* (1720–1740) was established by Jacques Lenfant to do for northern Europe what the *Bibliothèque britannique* did for England. It was followed by the *Nouvelle bibliothèque germanique* (1746–1759). The *Bibliothèque raisonnée des ouvrages des savants* (1728–1758) was supplementary to Leclerc, and was succeeded by the *Bibliothèque des sciences et des beaux-arts* (1754–1780). Nearly all of the preceding were produced either at Amsterdam or Rotterdam, and, although out of place in a precise geographical arrangement, really belong to France by the close ties of language and of blood.

Taking up the exact chronological order again, we find the success of the English essay-papers led to their prompt introduction to the Continent. An incomplete translation of the *Spectator* was published at Amsterdam in 1714, and many volumes of extracts from the *Tatler*, *Spectator* and *Guardian* were issued in France early in the 18th century. Marivaux brought out a *Spectateur Français* (1722), which was coldly received; it was followed by fourteen or fifteen others, under the titles of *La Spectatrice* (1728–1730), *Le Radoteur* (1775), *Le Babillard* (1778–1779), &c. Of a similar character was *Le Pour et le contre* (1723–1740) of the abbé Prévost, which contained anecdotes and criticism, with special reference to Great Britain. Throughout the 18th century, in France as in England, a favourite literary method was to write of social subjects under the assumed character of a foreigner, generally an

[1] Matthew Maty, M.D., born in Holland, 1718, died principal librarian of the British Museum, 1776. He settled in England in 1740, published several books, and wrote the preface to Gibbon's first work, *Etude de la littérature.*

of Lessing, Mendelssohn and Abbt. To Nicolai is also due the *Allgemeine deutsche Bibliothek* (1765–1806), which embraced a much wider field and soon became extremely influential. Herder founded the *Kritische Wälder* in 1766. *Der deutsche Merkur* (1773–1789, revived 1790–1810) of Wieland was the solitary representative of the French school of criticism. A new era in German periodical literature began when Bertuch brought out at Jena in 1785 the *Allgemeine Literaturzeitung*, to which the leading writers of the country were contributors. On being transferred to Halle in 1804 it was replaced by the *Jenaische allgemeine Literaturzeitung*, founded by Eichstädt. Both reviews enjoyed a prosperous career down to the year 1848.

At the beginning of the 19th century we find the *Erlanger Literaturzeitung* (1799–1810), which had replaced a *Gelehrte Zeitung* (1746); the *Leipziger Literaturzeitung* (1800–1834); the *Heidelbergische Jahrbücher der Literatur* (1808–1872); and the *Wiener Literaturzeitung* (1813–1816), followed by the *Wiener Jahrbucher der Literatur* (1818–1848), both of which received government support and resembled the English *Quarterly Review* in their conservative politics and high literary tone. *Hermes*, founded at Leipzig in 1819 by W. T. Krug, was distinguished for its erudition, and came out down to 1831. One of the most remarkable periodicals of this class was the *Jahrbucher fur wissenschaftliche Kritik* (1827–1846), first published by Cotta. The *Hallische Jahrbucher* (1838–1842) was founded by Ruge and Echtermeyer, and supported by the government. The *Repertorium der gesammten deutschen Literatur*, established by Gersdorf in 1834, and known after 1843 as the *Leipziger Repertorium der deutschen und ausländischen Literatur*, existed to 1860. Buchner founded the *Literarische Zeitung* at Berlin in 1834. It was continued by Brandes down to 1849. The political troubles of 1848 and 1849 were most disastrous to the welfare of the literary and miscellaneous periodicals. Gersdorf's *Repertorium*, the *Gelehrte Anzeigen* of Göttingen and of Munich, and the *Heidelbergische Jahrbucher* were the sole survivors. The *Allgemeine Monatschrift für Literatur* (1850), conducted after 1851 by Droysen, Nitzsch and others, continued only down to 1854; the *Literarisches Centralblatt* (1850) is still published. The *Blätter für literarische Unterhaltung* sprang out of the *Literarisches Wochenblatt* (1818), founded by Kotzebue; after 1865 it was edited by R. Gottschall with considerable success. Many of the literary journals did not disdain to occupy themselves with the fashions, but the first periodical of any merit specially devoted to the subject was the *Bazar* (1855). The first to popularize science was *Natur* (1852). The *Hausblätter* (1855), a bi-monthly magazine, was extremely successful. The *Salon* (1868) followed more closely the type of the English magazine. About this period arose a great number of weekly serials for popular reading, known as "Sonntagsblätter," of which the *Gartenlaube* (1858) and *Daheim* (1864) are surviving examples.

In course of time a large number of similar publications were issued, some illustrated, for instance: *Illustrierte Zeitung* (Leipzig, 1843), *Berliner Illustrierte Zeitung* (1892), *Die Woche* (1899) the last the most widely circulated of the kind, 500,000 being printed.

At a somewhat earlier date commenced a long series of weekly and monthly periodicals of a more solid character, of which the following list indicates the more important in chronological order: *Die Grenzboten* (1862), weekly; the *Deutsches Museum* (1851–1857), of Prutz and Frenzel; *Berliner Revue* (1855–1873); *Westermanns Monatshefte* (1856), monthly; *Unsere Zeit* (1857–1891), beginning as a kind of supplement to Brockhaus's *Conversationslexikon*; *Preussische Jahrbücher* (1858), monthly; *Deutsches Magazin* (1861–1863); *Die Gegenwart* (1873), weekly; *Konservative Monatsschrift* (1873), preceded by the *Volksblatt für Stadt und Land* (1843); *Deutsche Rundschau* (1874), fortnightly, conducted upon the method of the *Revue des deux mondes*; *Deutsche Revue* (1876), monthly; *Nord und Süd* (1877), monthly; *Das Echo* (1882), weekly; *Die Zukunft* (1882), weekly; *Die neue Zeit* (1883), weekly; *Reclams Universum* (1884), weekly; *Velhagen und Klasings Monatshefte* (1889), monthly; *Die deutsche Rundschau* (1890), monthly; *Die Wahrheit* (1893–1897); *Kritik* (1894–1902); *Die Umschau* (1897), weekly; *Das literarische Echo* (1898), fortnightly; *Kynast* (1898–1899), known later as *Deutsche Zeitschrift* (1899–1903) and *Iduna* (1903–1906); *Der Türmer* (1898), monthly; *Die Warte* (1900), weekly; *Deutschland* (1902–1907); *Deutsche Monatsschrift* (1902–1907); *Hochland* (1903), monthly; *Charon* (1904), monthly; *Süddeutsche Monatshefte* (1904); *Der Deutsche* (1905–1908); *Deutsche Kultur* (1905–1908); *Arena* (1906), monthly; *Das Blaubuch* (1906), weekly; *Eckart* (1906), monthly; *Die Standarte* (1906), weekly; *März* (1907), fortnightly; *Morgen* (1907), weekly; *Neue Revue* (1907), weekly; *Internationale Wochenschrift fur Wissenschaft, Kunst, und Technik* (1907), weekly supplement to the *Münchener allgemeine Zeitung*; *Wissen* (1907), weekly; *Unsere Zeit* (1907), monthly; *Hyperion* (1908), bi-monthly; *Xenien* (1908), monthly; *Das neue Jahrhundert* (1909), monthly; *Die Tat* (1909), monthly.

Periodicals have been specialized in Germany to an extent perhaps unequalled in any other country. No subject of human interest is now without one or indeed several organs. Full details of these serials are supplied by a special class of periodical with which every department of science, art and literature in German-speaking countries is equipped, the *Jahresberichte* and *Bibliographien*, which give each year a full account of the literature of the subject with which they are concerned. The chief of these are:—

Bibliography and Librarianship: *Bibliographie des Buch- und Bibliothekswesens* (1905); Chemistry: *Jahresbericht uber die Fortschritte der Chemie* (1847); Classical Archaeology and Philology: *Jahresbericht über die Fortschritte der klassischen Altertumswissenschaft* (1873); Education: *Jahrbuch der pädagogischen Literatur* (1901); Geography: *Geographisches Jahrbuch* (1874); *Bibliotheca geographica* (1891); History: *Jahresberichte der Geschichtswissenschaft* (1878); Fine Arts: *Internationale Bibliographie der Kunstwissenschaft* (1902); Law and Political Economy: *Uebersicht der gesamten staats- und rechtswissenschaftlichen Literatur* (1868); *Jurisprudentia Germaniae* (1905); *Bibliographie des bürgerlichen Rechts* (1888); *Bibliographie der Sozialwissenschaften* (1905); *Bibliographie für Sozial- und Wirtschaftsgeschichte* (1903); *Bibliographie für Volkswirtschaftslehre und Rechtswissenschaft* (1906); Literature and Languages: *Bibliographie der vergleichenden Literaturgeschichte* (1903); *Jahresberichte für neuere deutsche Literaturgeschichte* (1890); *Jahresbericht über die Erscheinungen auf dem Gebiete der germanischen Philologie* (1879); *Uebersicht über die auf dem Gebiete der englischen Philologie erschienenen Bücher, Schriften, und Aufsätze* (1878); *Kritischer Jahresbericht über die Fortschritte der romanischen Philologie* (1875); *Bibliographie für romanische Philologie—Supl. zur Zeitschr. f. roman. Philologie* (1875); *Orientalische Bibliographie* (1888); Mathematics: *Jahrbuch über die Fortschritte der Mathematik* (1869); Medicine and Surgery: *Jahresbericht über die Leistungen und Fortschritte der gesamten Medizin* (1866); *Jahresbericht über die Leistungen auf dem Gebiete der Veterinärmedizin* (1881); Military: *Jahresbericht über Veränderungen und Fortschritte im Militärwesen* (1874); *Jahresbericht über die Leistungen und Fortschritte auf dem Gebiete des Militärsanitätswesens* (1873); Natural Science: *Naturae novitates* (1879), fortnightly; *Bibliographie der deutschen naturwissenschaftlichen Literatur* (1901); *Bibliographia zoologica* (1896); *Zoologischer Jahresbericht* (1879); *Justs botanischer Jahresbericht* (1873); *Die Fortschritte der Physik* (1847); Technicology: *Repertorium der technischen Journalliteratur* (1874); Theology: *Theologischer Jahresbericht* (1881); *Bibliographie der Kirchengeschichtlichen Literatur* (1877).

Austria

The most notable periodicals of a general character have been the *Wiener Jahrbücher der Literatur* (1818–1848) and the *Oesterreichische Revue* (1863–1867). Among current examples the following may be mentioned: *Heimgarten* (1877), monthly; *Oesterreichisch-Ungarische Revue* (1886), monthly; *Allgemeines Literaturblatt* (1892), fortnightly; *Die Kultur* (1899), quarterly; *Deutsche Arbeit* (1900), monthly; *Oesterreichische Rundschau* (1904), fortnightly; *Die Karpathen* (1907); fortnightly.

There were in Austria 22 literary and 41 special periodicals in 1848, and 110 literary and 413 special periodicals in 1873 (see the statistical inquiry of Dr Johann Winckler, *Die period. Presse Oesterreichs*, 1875). In 1905 the total number had increased to 806, of which 564 were published in Vienna.

According to the *Deutscher Zeitschriften-Katalog* (1874), 2219 periodicals were published in Austria, Germany and Switzerland in 1874 in the German language. In 1905 the number of periodicals in German-speaking countries was 5066, of which 4019 appeared in Germany (in Berlin alone 1107) 806 in Austria and 218 in Switzerland (*Börsenblatt für den deutschen Buchhandel*, 1909, No. 124).

Authorities.—C. Juncker, *Schediasma de ephemeridibus eruditorum* (Leipzig, 1692); H. Kurz, *Geschichte der deutschen Literatur* (Leipzig, 1852); R. Prutz, *Geschichte des deutschen Journalismus* (1845), vol. i.—unfortunately it does not go beyond 1713); H. Wuttke, *Die deutschen Zeitschriften* (1875); P. E. Richter, *Verzeichnis der Periodica im Besitze der k. öff. Bibl. zu Dresden* (1880); *Generalkatalog der laufenden periodischen Druckschriften an den oesterr. Universitäts- und Studienbibliotheken hrsg. von F. Grassauer* (Vienna, 1898); Königliche Bibliothek zu Berlin, *Alphabetisches Verzeichnis der laufenden Zeitschriften* (1908); *Systematisches Verzeichnis der laufenden Zeitschriften* (1908); *Alphabetisches Verzeichnis der laufenden Zeitschriften, welche von der K. Hof- und Staatsbibliothek München und einer Anzahl anderer Bibliotheken Bayern gehalten werden* (München, 1909); Kürschner, *Jahrbuch der Presse* (1902); *Sperlings Zeitschriften Adressbuch* (Stuttgart, 1910); Bibliographisches Repertorium, Berlin: Walzel-Houben, *Zeitschriften der Romantik* (1904); Houben, *Zeitschriften des jungen Deutschlands* (1906); Luck, *Die deutsche Fachpresse* (Tübingen, 1908). The *Bibliographie der deutschen Zeitschriftenliteratur*, edited by F. Dieterich, which has appeared annually since 1896, describes about 1300 periodicals (mostly scientific) by subjects and titles; from 1900 it has been supplemented by *Bibliographie der deutschen Recensionen*, which indexes notices and reviews in over 1000 serials each year, chiefly scientific and technical.

Switzerland

The *Nova litteraria helvetica* (1703–1715) of Zurich is the earliest literary periodical which Switzerland can show. From 1728 to 1734 a *Bibliothèque italique*, and towards the end of the century the *Bibliothèque britannique* (1796–1815), dealing with agriculture, literature, and science, in three separate series, were published at Geneva. The latter was followed by the leading periodical

of French-speaking Switzerland, the *Bibliothèque universelle* (1816), which has also had a scientific and a literary series. The *Revue suisse* (1838) was produced at Neuchâtel. These two have been amalgamated and appear as the *Bibliothèque universelle et revue suisse. La Suisse romande* (1885) only lasted twelve months. *Théologie et philosophie* (1868–1872), an account of foreign literature on those subjects, was continued as *Revue de théologie et de philosophie* (1873) at Lausanne. Among current serials may be mentioned *Archives de psychologie de la Suisse romande* (1901) edited by Flournoy and Claparède; *Jahresverzeichnis der schweizerischen Universitätsschriften* (1897–1898); *Untersuchungen zur neueren Sprach- und Literaturgeschichte* (1903); *Zwingliana Mitteilungen zur Geschichte Zwingli und der Reformation* (1897).

Italy

Prompted by M. A. Ricci, Francesco Nazzari, the future cardinal, established in 1668 the *Giornale de' letterati* upon the plan of the French *Journal des savants*. His collaborateurs each agreed to undertake the criticism of a separate literature while Nazzari retained the general editorship and the analysis of the French books. The journal was continued to 1675, and another series was carried on to 1769. Bacchini brought out at Parma (1688–1690) and at Modena (1692–1697) a periodical with a similar title. A much better known *Giornale* was that of Apostolo Zeno, founded with the help of Maffei and Muratori (1710), continued after 1718 by Pietro Zeno, and after 1728 by Mastraca and Paitoni. Another *Giornale*, to which Fabroni contributed, was published at Pisa from 1771 onwards. The *Galleria di Minerva* was first published at Venice in 1696. One of the many merits of the antiquary Lami was his connexion with the *Novelle letterarie* (1740–1770), founded by him, and after the first two years almost entirely written by him. Its learning and impartiality gave it much authority. The *Frusta letteraria* (1763–1765) was brought out at Venice by Giuseppe Baretti under the pseudonym of Aristarco Scannabue. The next that deserve mention are the *Giornale enciclopedico* (1806) of Naples, followed by the *Progresso delle scienze* (1833–1848) and the *Museo di scienze e letteratura* of the same city, and the *Giornale arcadico* (1819) of Rome. Among the contributors to the *Poligrafo* (1811) of Milan were Monti, Perticari, and some of the first names in Italian literature. The *Biblioteca italiana* (1816–1840) was founded at Milan by the favour of the Austrian government, and the editorship was offered to and declined by Ugo Foscolo. It rendered service to Italian literature by its opposition to the Della-Cruscan tyranny. Another Milanese serial was the *Conciliatore* (1818–1820), which although it only lived two years, will be remembered for the endeavours made by Silvio Pellico, Camillo Ugoni and its other contributors to introduce a more dignified and courageous method of criticism. After its suppression and the falling off in interest of the *Biblioteca italiana* the next of any merit to appear was the *Antologia*, a monthly periodical brought out at Florence in 1820 by Gino Capponi and Giampetro Vieusseux, but suppressed in 1833 on account of an epigram of Tommaseo, a principal writer. Some striking papers were contributed by Giuseppe Mazzini. Naples had in 1832 *Il Progresso* of Carlo Troya, helped by Tommaseo and Centofanti, and Palermo owned the *Giornale di statistica* (1834), suppressed eight years later. The *Archivio storico*, consisting of reprints of documents with historical dissertations, dates from 1842, and was founded by Vieusseux and Gino Capponi. The *Civiltà cattolica* (1850), fortnightly, is still the organ of the Jesuits. The *Rivista contemporanea* (1852) was founded at Turin in emulation of the French *Revue des deux mondes*, which has been the type followed by so many continental periodicals. The *Politecnico* (1839) of Milan was suppressed in 1844 and revived in 1859. The *Nuova antologia* (1866) soon acquired a well-deserved reputation as a high-class review and magazine; its rival, the *Rivista europea*, being the special organ of the Florentine men of letters. The *Rassegna settimanale* was a weekly political and literary review, which after eight years of existence gave place to a daily newspaper, the *Rassegna*. The *Archivio trentino* (1882) was the organ of "Italia Irredenta." The *Rassegna nazionale*, conducted by the marchese Manfredo di Passano, a chief of the moderate clerical party, the *Nuova rivista* of Turin, the *Fanfulla della Domenica*, and the *Gazzetta letteraria* may also be mentioned.

Some of the following are still published: *Annali di matematica* (1867); *Annuario di giurisprudenza* (1883); *Archivio di statistica* (1876); *Archivio storico lombardo* (1874); *Archivio veneto* (1871); *Archivio per lo studio delle tradizioni popolari*; *Archivio per la zoologia*; *Il Bibliofilo*; *Il Filangieri* (1876); *La Natura* (1884); *Nuovo giornale botanico* (1869); *Giornale degli eruditi* (1883); *Giornale di filologia romanza*; *Nuova rivista Internazionale* (1879); *La Rassegna italiana* (1881); *Revue internationale* (1883). In more recent years a great expansion has been witnessed. Local reviews have largely increased, as well as those devoted to history, science and university undertakings. Among representative serials are the following—Archaeology: *Museo italiano di antichita classica* (1885) with atlas in folio; *Oriens christianus* (1901); *Nuovo bollettino di archeologia cristiana*, quarterly at Rome (1895). Bibliography: *Rivista delle biblioteche e degli archivi* (1888), published monthly at Rome and Florence, the official organ of librarians and archivists; *Giornale della libreria della tipografia* (1888), supplement to the *Bibliografia italiana*; *Bollettino di bibliografia e storia delle scienze matematiche* (1898); *La Bibliofilia* (1899), Florence, monthly; *Raccolta Vinciana* (1904). Philology: *Bollettino di filologia classica* (1894); *Giornale italiano di filologia e linguistica classica* (1886); *Studi di filologia romanza* (1885); *Studi italiani di filologia classica* (1893); *Bessarione*, bi-monthly. No class has developed more usefully than the historical, among them being: *Bollettino dell' istituto storico italiano* (1886); *Nuovo archivio veneto* (1890); *Rivista di storia antica e scienze affini* (1895); *Rivista storica italiana* (1884). New literary and scientific reviews are: *L'Alighieri, rivista di cose dantesche* (1889); *Giornale dantesco* (1894); *Giornale storico della letteratura italiana* (1883); *Studi di letteratura italiana* (1899); *Studi medievali* (1904); *L'Arcadia, periodico mensile di scienze, lettere, ed arti* (1889); *Periodico di matematica per l'insegnamento secondario* (1885); *Rivista di matematica* (1891); *Rivista philosofica* (1899); *Rivista d'Italia*, monthly at Rome. Fine Arts: *L'Arte*, monthly; *Arte italiana*, monthly; *Rassegna d'arte*, monthly.

Authorities.—See G. Ottino, *La Stampa periodica in Italia* (Milan, 1875); *Raccolta dei periodici presentata all' esposizione in Milano* (1881); A. Roux, *La Littérature contemporaine en Italie* (1871–1883), Paris, 1883.

Belgium

The *Journal encyclopédique* (1756–1793) founded by P. Rousseau, made Liége a propagandist centre for the philosophical party. In the same city was also first established *L'Esprit des journaux* (1772–1818), styled by Sainte-Beuve "cette considérable et excellente collection," but "journal voleur et compilateur." The *Journal historique et littéraire* (1788–1790) was founded at Luxemburg by the Jesuit De Feller; having been suppressed there, it was transferred to Liége, and subsequently to Maestricht. It is one of the most curious of the Belgian periodicals of the 18th century, and contains most precious materials for the national history. A complete set is very rare and much sought after. The *Revue belge* (1835–1843), in spite of the support of the best writers of the kingdom, as well as its successor the *Revue de Liége* (1844–1847), the *Trésor national* (1842–1843), published at Brussels, and the *Revue de Belgique* (1846–1851) were all short-lived. The *Revue de Bruxelles* (1837–1848), supported by the nobility and the clergy, had a longer career. The *Revue nationale* was the champion of Liberalism, and came to an end in 1847. The *Messager des sciences historiques* (1833), at Ghent, was in repute on account of its historical and antiquarian character. The *Revue catholique*, the organ of the professors of the university of Louvain, began in 1846 a controversy with the *Journal historique et littéraire* of Kersten (1834) upon the origin of human knowledge, which lasted for many years and excited great attention. The *Annales des travaux publics* (1843), the *Bulletin de l'industrie* (1842), the *Journal des beaux-arts* (1858), and the Catholic *Précis historiques* (1852), the Protestant *Chrétien belge* (1850), are other examples. The *Revue trimestrielle* was founded at Brussels by Van Bemmel in 1854. The *Athenaeum belge* (1868) did not last long.

Among current periodicals in French are the following—Bibliography: *Bulletin bibliographique et pédagogique du musée belge* (1897); *La Revue des bibliothèques et archives de Belgique* (1903); *Le Glaneur littéraire, musical et bibliographie* (1901); *Archives des arts et de la bibliographie de Belgique* (Tables 1833–1853 and 1875–1894). Philosophy and ecclesiastical history: *Revue neo-scholastique publiée par la société philosophique de Louvain* (1894); *Revue d'histoire ecclésiastique* (1900), the organ of the Catholic university of Louvain; *Revue bénédictine* (1884); *Analectes pour servir à l'histoire ecclésiastique de la Belgique*, 2ᵉ série (1881–1904) and 3ᵉ série 1905); with an *Annexe* for Cartularies. Science: *Archives internationales de physiologie* (1902), published by Léon Fredericq; *La Cellule, recueil de cytologie et d'histologie générale* (1884); *Le Muséon* (1882); *Le Mouvement géographique* (1884); *Le Musée belge* (1897); *Revue chirurgicale belge et du nord de la France* (1901). *Annales des mines belgiques* appears quarterly, and *L'Art moderne* weekly at Brussels.

Among Flemish serials may be mentioned the *Nederduitsche Letteroefeningen* (1834); the *Belgisch Museum* (1836–1846), edited by Willems; the *Broederhand*, which did not appear after 1846; the *Taalverbund* of Antwerp; the *Kunst- en Letterblad* (1840–1843); and the *Vlaemsche Rederyker* (1844). Current Flemish periodicals include: *Onze kunst geïllustreed maandschrift voor beeldende kunst* (1900); *Averbode's weekblad Godsdienst huisgezin moedertaal* (1907); *De Raadselbode tolk van den vlamschen raadselliefhebber* (1901); *Rechtskundig tijdschrift voor vlamsch Belgie* (1901).

It has been calculated that in 1860 there were 51 periodicals published in Belgium. In 1884 the number had increased to 412, and in 1908 to 1701.

See U. Capitaine, *Recherches sur les journaux et les écrits périodiques liégeois* (1850); *Relevé de tous les écrits périodiques qui se publient dans le royaume de Belgique* (1875); *Catalogue des journaux, revues, et publications périodiques de la Belgique* (1910); *Revue bibliographique belge.*

Holland

The first serial written in Dutch was the *Boekzaal van Europa* (1692–1708, and 1715–1748), which had several changes of name

during its long life. The next of any note was the *Republijk der Geleerden* (1710–1748). The English *Spectator* was imitated by J. van Effen in his *Misanthrope* (1711–1712), written in French, and in the *Hollandsche Spectator* (1731–1735), in Dutch. An important serial was the long-lived *Vaderlandsche Letteroefeningen* (1761). The *Algemeene Kunst en Letterbode* (1788) was long the leading review of Holland; in 1860 it was joined to the *Nederlandsch Spectator* (1855). Of those founded in the 19th century may be mentioned the *Recensent* (1803), and *Nieuwe Recensent*; the *Nederlandsch Museum* (1835); the *Tijdstroom* (1857); the *Tijdspiegel*, a literary journal of Protestant tendency; the *Theologisch Tijdschrift* (1867), the organ of the Leiden school of theology; and the *Dietsche Warande*, a Roman Catholic review devoted to the national antiquities. Colonial interests have been cared for by the *Tijdschrift voor nederlandsch Indie* (1848). Current periodicals are *Hollandsche revue*, monthly; *De Gids* (1837), monthly; *De nieuwe Gids* (1886), monthly; *De Architect*, bi-monthly; *Caecilia* (for music); *Tijdschrift voor Strafrecht*; *Museum*, for philology (1893), monthly; *Tijdschrift voor nederlandsche taal en letterkunde*; *Nederlandsch Archievenblad*; *De Paleograaf*; *Elseviers geïllustreerd Maandschrift*, monthly· *Groot Nederland*, monthly.

Denmark

Early in the 18th century Denmark had the *Nye Tidender* (1720), continued down to 1836 under the name of *Danskliteraturtidende*. The *Minerva* (1785) of Rahbek was carried on to 1819, and the *Skandinavisk Museum* (1798–1803) was revived by the *Litteratur-Selskabs Skrifter* (1805). These were followed by the *Laerde Efterretninger* (1799–1810), afterwards styled *Litteratur-Tidende* (1811–1836), the *Athene* (1813–1817), and *Historisk Tidsskrift* (1840). In more modern times appeared *Tidsskrift for Litteratur og Kritik* (1832–1842, 1843); *Maanedsskrift for Litteratur* (1829–1838); *Nord og Syd* (1848–1849) of Goldschmidt, succeeded by *Ude og Hjemme*, and the *Dansk Maanedsskrift* (1858) of Steenstrup, with signed historical and literary articles. One of the most noteworthy Scandinavian periodicals has been the *Nordisk Universitets Tidsskrift* (1854–1864), a bond of union between the universities of Christiania, Upsala, Lund and Copenhagen. Current periodicals are: *Studier fra Sprog- og Oldtidsforskning* (1891), quarterly; *Danske Magazin*, yearly; *Nyt Tidsskrift for Mathematik*, monthly; *Theologisk Tidsskrift*, monthly; *Nationalökonomisk Tidsskrift*, bi-monthly; *Dansk bogfortegnelse*, bi-monthly for bibliography; *Athenaeum finsk*; *Tilskueren*, monthly; *Aarboger for Nordisk Oldkyndighed* (archaeology) quarterly.

Iceland has had the *Islenzk Sagnablöd* (1817–1826), *Ný Fjelagsrit* (1841–1873), and *Gefn* (1870–1873). *Skirnir* (1831), which absorbed in 1905 *Timarit hins islenska Bokmentafélags* (1880–1904), is still published.

Norway

The first trace of the serial form of publication to be found in Norway is in the *Ugentlige korte Afhandlinger* (1760–1761), "Weekly Short Treatises," of Bishop Fr. Nannestad, consisting of moral and theological essays. The *Maanedlige Afhandlinger* (1762), "Monthly Treatises," was supported by several writers and devoted chiefly to rural economy. These two were followed by *Politik og Historie* (1807–1810); *Saga* (1816–1820), a quarterly review edited by J. S. Munch; *Den norske Tilskuer* (1817–1821), a miscellany brought out at Bergen; *Hermoder* (1821–1827), a weekly aesthetic journal; *Iduna*, (1822–1823), of the same kind but of less value; *Vidar* (1832–1834), a weekly scientific and literary review; *Nor* (1840–1846), of the same type; *Norsk Tidsskrift for Videnskab og Litteratur* (1847–1855); *Illustreret Nyhedsblad* (1851–1866), "Illustrated News"; *Norsk Maanedsskrift* (1856–1860), "Monthly Review for Norway," devoted to history and philology; and *Norden* (1866), a literary and scientific review. Popular serials date from the *Skilling Magasin* (1835), which first introduced wood-engraving. Representative current periodicals are: *Samtiden*, monthly; *Elektroteknisk tidsskrift*· *nordisk musik-revue*, fortnightly; *Naturen*; *Norsk havetidende*, monthly; *Urd*; *Norvegia*.

Sweden

The *Swenska Argus* (1733–1734) of Olof Dalin is the first contribution of Sweden to periodical literature. The next were the *Tidningar om den Lärdas Arbeten* (1742) and the *Lärda Tidningar*. The patriotic journalist C. C. Gjörwell established about twenty literary periodicals of which the most important was the *Swenska Mercurius* (1755–1789). Atterbom and some fellow-students founded about 1810 a society for the deliverance of the country from French pedantry, which with this end carried on a periodical entitled *Phosphoros* (1810–1813), to propagate the opinions of Schlegel and Schelling. The *Svensk Literatur-Tidning* (1813–1825) of Palmblad and the *Polyfem* (1810–1812) had the same objects. Among later periodicals we may mention *Skandia* (1833–1837); *Literaturbladet* (1838–1840); *Ställningar och Forhallanden* (1838) of Crusenstolpe, a monthly review of Scandinavian history; *Tidskrift för Litteratur* (1850); *Norsk Tidsskrift* (1852), weekly, *Förr och Nu*; and the *Revue suédoise* (1858) of Kramer, written in French. Among the monthlies which now appear are the following: *Social Tidskrift*, *Nordisk Tidskrift* and *Ord och Bild*.

Spain

Spain owes her intellectual emancipation to the monk Benito Feyjóo, who in 1726 produced a volume of dissertations somewhat after the fashion of the *Spectator*, but on graver subjects, entitled *Teatro critico*, which was continued down to 1739. His *Cartas eruditas* (1742–1760) were also issued periodically. The earliest critical serial, the *Diario de los literatos* (1737–1742), kept up at the expense of Philip V., did not long survive court favour. Other periodicals which appeared in the 18th century were Mañer's *Mercurio* (1738); the *Diario noticioso* (1758–1781); *El Pensador* (1762–1767) of Joseph Clavijo y Fajardo; *El Belianis literario* (1765), satirical in character; the *Semanario erudito* (1778–1791), a clumsy collection of documents; *El Correo literario de la Europa* (1781–1782); *El Censor* (1781); the valuable *Memorial literario* (1784–1808); *El Correo literario* (1786–1791), devoted to literature and science; and the special organs *El Correo mercantil* (1792–1798) and *El Semanario de agricultura* (1797–1805). In the 19th century were *Variedades de ciencias, literatura, y artes* (1803–1805), among whose contributors have been the distinguished names of Quintana, Moratin and Antillon; *Misceldnea de comercio* (1819); and *Diario general de las ciencias medicas*. The Spanish refugees in London published *Ocios de españoles refugiados* (1823–1826) and *Misceldnea hispano-americana* (1824–1828), and at Paris *Misceldnea escojida americana* (1826). The *Crónica cientifica y literaria* (1817–1820) was afterwards transformed into a daily newspaper. Subsequently to the extinction of *El Censor* (1820–1823) there was nothing of any value until the *Cartas españolas* (1832), since known as the *Revista española* (1832–1836) and as the *Revista de Madrid* (1838). Upon the death of Ferdinand VII. periodicals had a new opening; in 1836 there were published sixteen journals devoted to science and art. The fashion of illustrated serials was introduced in the *Semanario pintoresco español* (1836–1857), noticeable for its biographies and descriptions of Spanish monuments. *El Panorama* (1839–1841) was another literary periodical with engravings. Of later date have been the *Revista ibérica* (1861–1863), conducted by Sanz del Rio; *La America* (1857–1870), specially devoted to American subjects and edited by the brothers Asquerino; *Revista de Cataluña*, published at Barcelona; *Revista de España*; *Revista contemporánea*; *España moderna* (1889), and *Revista critica* (1895). Current special periodicals are: *Euskal-erria, revista bascongada* (1880, San Sebastian); *Monumenta historica societatis Jesu* (1894); *El Progreso matematico*, afterwards *Revista de matematicas puras y aplicadas* (1891); *Revista de bibliografia Catalano* (Catalunya, Baleares, Rosselò, Valencia, 1901); *La Naturaleza*, fortnightly; *La Energia eléctrica*, fortnightly; *Revista minera*, weekly; *Revista de medicina*, weekly; *Bibliografia española*, fortnightly; *La Lectura*; *España y America*, monthly.

See E. Hartzenbusch, *Periódicos de Madrid* (1876); Lapeyre, *Catalogo-tarifa de los periódicos, revistas, y ilustraciones en España* (1882); Georges le Gentil, *Les Revues littéraires de l'Espagne pendant la première moitié du XIX^e^ siècle* (Paris, 1909).

Portugal

Portugal could long boast of only one review, the *Jornal enciclopedico* (1779–1806), which had many interruptions; then came the *Jornal de Coimbra* (1812–1820); the *Panorama* (1836–1857), founded by Herculano; the *Revista universal lisbonense* (1841–1853), established by Castilho; the *Instituto* (1853) of Coimbra; the *Archivo pittoresco* (1857) of Lisbon; and the *Jornal do sociedade dos amigos das letteras*. In 1868 a review called *Vox femenina*, and conducted by women, was established at Lisbon. Current periodicals include: *O Archeologo portuguès* (1895); *Jornal de sciencias mathematicas et astronomicas* (1877); *Revista lusitana*, *Archivo de estudos philologicos e ethnologicos relativos á Portugal* (1887); *Ta-ssi-Yang-Kuo*, *Archivos e annaes de extremo oriente portuguez* (1899); *Portugal artistico*, fortnightly; *Revista militar*; *Arte musical*, fortnightly; *Boletim do agricultor*, monthly; *Archivo historico portuguez*, monthly.

Greece

The periodical literature of modern Greece commences with 'Ο Λογιος Ἑρμῆς, brought out at Vienna in 1811 by Anthimos Gazi and continued to 1821. In Aegina the Αἰγιναῖα appeared in 1831, edited by Mustoxidis; and at Corfu, in Greek, Italian and English, the 'Ανθολογία (1834). After the return of King Otho in 1833 a literary review called Ἶρις was commenced. *Le Spectateur de l'Orient*, in French, pleaded the national cause before Europe for three years from 1853. A military journal was published at Athens in 1855, and two years later the archaeological periodical conducted by Pittakis and Rangabes. For many years Πανδώρα (1850–1872), edited by Rangabes and Paparrigopoulos, was the leading serial. Φύσις dealt with natural science, the Γεωπονικά with agriculture, and Ἱερομνήμων with theology. Ἐθνικὸν πανεπιστήμιον (1831) and Φιλολογικὸς σύλλογος Παρνασσός (1863) appear annually and Ἀθηνᾶ (1899) quarterly.

See A R. Rangabé, *Hist. littéraire de la Grèce moderne* (Paris, 1879); R. Nicolai, *Geschichte der neugriechischen Literatur* (1876).

Russia

The historian Gerhard Friedrich Müller made the first attempt to establish periodical literature in Russia in his *Yejem'yesyatchniva*

of French-speaking Switzerland, the *Bibliothèque universelle* (1816), which has also had a scientific and a literary series. The *Revue suisse* (1838) was produced at Neuchâtel. These two have been amalgamated and appear as the *Bibliothèque universelle et revue suisse*. *La Suisse romande* (1885) only lasted twelve months. *Théologie et philosophie* (1868–1872), an account of foreign literature on those subjects, was continued as *Revue de théologie et de philosophie* (1873) at Lausanne. Among current serials may be mentioned *Archives de psychologie de la Suisse romande* (1901) edited by Flournoy and Claparède; *Jahresverzeichnis der schweizerischen Universitätsschriften* (1897–1898); *Untersuchungen zur neueren Sprach- und Literaturgeschichte* (1903); *Zwingliana Mitteilungen zur Geschichte Zwingli und der Reformation* (1897).

Italy

Prompted by M. A. Ricci, Francesco Nazzari, the future cardinal, established in 1668 the *Giornale de' letterati* upon the plan of the French *Journal des savants*. His collaborateurs each agreed to undertake the criticism of a separate literature while Nazzari retained the general editorship and the analysis of the French books. The journal was continued to 1675, and another series was carried on to 1769. Bacchini brought out at Parma (1688–1690) and at Modena (1692–1697) a periodical with a similar title. A much better known *Giornale* was that of Apostolo Zeno, founded with the help of Maffei and Muratori (1710), continued after 1718 by Pietro Zeno, and after 1728 by Mastraca and Paitoni. Another *Giornale*, to which Fabroni contributed, was published at Pisa from 1771 onwards. The *Galleria di Minerva* was first published at Venice in 1696. One of the many merits of the antiquary Lami was his connexion with the *Novelle letterarie* (1740–1770), founded by him, and after the first two years almost entirely written by him. Its learning and impartiality gave it much authority. The *Frusta letteraria* (1763–1765) was brought out at Venice by Giuseppe Baretti under the pseudonym of Aristarco Scannabue. The next that deserve mention are the *Giornale enciclopedico* (1806) of Naples, followed by the *Progresso delle scienze* (1833–1848) and the *Museo di scienze e letteratura* of the same city, and the *Giornale arcadico* (1819) of Rome. Among the contributors to the *Poligrafo* (1811) of Milan were Monti, Perticari, and some of the first names in Italian literature. The *Biblioteca italiana* (1816–1840) was founded at Milan by the favour of the Austrian government, and the editorship was offered to and declined by Ugo Foscolo. It rendered service to Italian literature by its opposition to the Della-Cruscan tyranny. Another Milanese serial was the *Conciliatore* (1818–1820), which although it only lived two years, will be remembered for the endeavours made by Silvio Pellico, Camillo Ugoni and its other contributors to introduce a more dignified and courageous method of criticism. After its suppression and the falling off in interest of the *Biblioteca italiana* the next of any merit to appear was the *Antologia*, a monthly periodical brought out at Florence in 1820 by Gino Capponi and Giampetro Vieusseux, but suppressed in 1833 on account of an epigram of Tommaseo, a principal writer. Some striking papers were contributed by Giuseppe Mazzini. Naples had in 1832 *Il Progresso* of Carlo Troya, helped by Tommaseo and Centofanti, and Palermo owned the *Giornale di statistica* (1834), suppressed eight years later. The *Archivio storico*, consisting of reprints of documents with historical dissertations, dates from 1842, and was founded by Vieusseux and Gino Capponi. The *Civiltà cattolica* (1850), fortnightly, is still the organ of the Jesuits. The *Rivista contemporanea* (1852) was founded at Turin in emulation of the French *Revue des deux mondes*, which has been the type followed by so many continental periodicals. The *Politecnico* (1839) of Milan was suppressed in 1844 and revived in 1859. The *Nuova antologia* (1866) soon acquired a well-deserved reputation as a high-class review and magazine; its rival, the *Rivista europea*, being the special organ of the Florentine men of letters. The *Rassegna settimanale* was a weekly political and literary review, which after eight years of existence gave place to a daily newspaper, the *Rassegna*. The *Archivio trentino* (1882) was the organ of "Italia Irredenta." The *Rassegna nazionale*, conducted by the marchese Manfredo di Passano, a chief of the moderate clerical party, the *Nuova rivista* of Turin, the *Fanfulla della Domenica*, and the *Gazzetta letteraria* may also be mentioned.

Some of the following are still published: *Annali di matematica* (1867); *Annuario di giurisprudenza* (1883); *Archivio di statistica* (1876); *Archivio storico lombardo* (1874); *Archivio veneto* (1871); *Archivio per lo studio delle tradizioni popolari*; *Archivio per la zoologia*; *Il Bibliofilo*; *Il Filangieri* (1876); *La Natura* (1884); *Nuovo giornale botanico* (1869); *Giornale degli eruditi* (1883); *Giornale di filologia romanza*; *Nuova rivista Internazionale* (1879); *La Rassegna italiana* (1881); *Revue internationale* (1883). In more recent years a great expansion has been witnessed. Local reviews have largely increased, as well as those devoted to history, science and university undertakings. Among representative serials are the following—Archaeology: *Museo italiano di antichità classica* (1885) with atlas in folio; *Oriens christianus* (1901); *Nuovo bollettino di archeologia cristiana*, quarterly at Rome (1895). Bibliography: *Rivista delle biblioteche e degli archivi* (1888), published monthly at Rome and Florence, the official organ of librarians and archivists; *Giornale della libreria della tipografia* (1888), supplement to the *Bibliografia italiana*; *Bollettino di bibliografia e storia delle scienze matematiche* (1898); *La Bibliofilia* (1899), Florence, monthly; *Raccolta Vinciana* (1904). Philology: *Bollettino di filologia classica* (1894); *Giornale italiano di filologia e linguistica classica* (1886); *Studi di filologia romanza* (1885); *Studi italiani di filologia classica* (1893); *Bessarione*, bi-monthly. No class has developed more usefully than the historical, among them being: *Bollettino dell' istituto storico italiano* (1886); *Nuovo archivio veneto* (1890); *Rivista di storia antica e scienze affini* (1895); *Rivista storica italiana* (1884). New literary and scientific reviews are: *L'Alighieri, rivista di cose dantesche* (1889); *Giornale dantesco* (1894); *Giornale storico della letteratura italiana* (1883); *Studi di letteratura italiana* (1899); *Studi medievali* (1904); *L'Arcadia, periodico mensile di scienze, lettere, ed arti* (1889); *Periodico di matematica per l'insegnamento secondario* (1885); *Rivista di matematica* (1891); *Rivista philosofica* (1899); *Rivista d'Italia*, monthly at Rome. Fine Arts: *L'Arte*, monthly; *Arte italiana*, monthly; *Rassegna d'arte*, monthly.

Authorities.—See G. Ottino, *La Stampa periodica in Italia* (Milan, 1875); *Raccolta dei periodici presentata all' esposizione in Milano* (1881); A. Roux, *La Littérature contemporaine en Italie* (1871–1883), Paris, 1883.

Belgium

The *Journal encyclopédique* (1756–1793) founded by P. Rousseau, made Liége a propagandist centre for the philosophical party. In the same city was also first established *L'Esprit des journaux* (1772–1818), styled by Sainte-Beuve "cette considérable et excellente collection," but "journal voleur et compilateur." The *Journal historique et littéraire* (1788–1790) was founded at Luxemburg by the Jesuit De Feller; having been suppressed there, it was transferred to Liége, and subsequently to Maestricht. It is one of the most curious of the Belgian periodicals of the 18th century, and contains most precious materials for the national history. A complete set is very rare and much sought after. The *Revue belge* (1835–1843), in spite of the support of the best writers of the kingdom, as well as its successor the *Revue de Liége* (1844–1847), the *Trésor national* (1842–1843), published at Brussels, and the *Revue de Belgique* (1846–1851) were all short-lived. The *Revue de Bruxelles* (1837–1848), supported by the nobility and the clergy, had a longer career. The *Revue nationale* was the champion of Liberalism, and came to an end in 1847. The *Messager des sciences historiques* (1833), at Ghent, was in repute on account of its historical and antiquarian character. The *Revue catholique*, the organ of the professors of the university of Louvain, began in 1846 a controversy with the *Journal historique et littéraire* of Kersten (1834) upon the origin of human knowledge, which lasted for many years and excited great attention. The *Annales des travaux publics* (1843), the *Bulletin de l'industrie* (1842), the *Journal des beaux-arts* (1858), and the Catholic *Précis historiques* (1852), the Protestant *Chrétien belge* (1850), are other examples. The *Revue trimestrielle* was founded at Brussels by Van Bemmel in 1854. The *Athenaeum belge* (1868) did not last long.

Among current periodicals in French are the following—Bibliography: *Bulletin bibliographique et pédagogique du musée belge* (1897); *La Revue des bibliothèques et archives de Belgique* (1903); *Le Glaneur littéraire, musical et bibliographie* (1901); *Archives des arts et de la bibliographie de Belgique* (Tables 1833–1853 and 1875–1894). Philosophy and ecclesiastical history: *Revue neo-scholastique publiée par la société philosophique de Louvain* (1894); *Revue d'histoire ecclésiastique* (1900), the organ of the Catholic university of Louvain; *Revue bénédictine* (1884); *Analectes pour servir à l'histoire ecclésiastique de la Belgique*, 2e série (1881–1904) and 3e série 1905); with an *Annexe* for Cartularies. Science: *Archives internationales de physiologie* (1902), published by Léon Fredericq; *La Cellule, recueil de cytologie et d'histologie générale* (1884); *Le Muséon* (1882); *Le Mouvement géographique* (1884); *Le Musée belge* (1897); *Revue chirurgicale belge et du nord de la France* (1901). *Annales des mines belgiques* appears quarterly, and *L'Art moderne* weekly at Brussels.

Among Flemish serials may be mentioned the *Nederduitsche Letteroefeningen* (1834); the *Belgisch Museum* (1836–1846), edited by Willems; the *Broederhand*, which did not appear after 1846; the *Taalverbund* of Antwerp; the *Kunst- en Letterblad* (1840–1843); and the *Vlaemsche Rederyker* (1844). Current Flemish periodicals include: *Onze kunst geïllustreed maandschrift voor beeldende kunst* (1900); *Averbode's weekblad Godsdienst huisgezin moedertaal* (1907); *De Raadselbode tolk van den vlamschen raadselliefhebber* (1901); *Rechtskundig tijdschrift voor vlamsch Belgie* (1901).

It has been calculated that in 1860 there were 51 periodicals published in Belgium. In 1884 the number had increased to 412, and in 1908 to 1701.

See U. Capitaine, *Recherches sur les journaux et les écrits périodiques liégeois* (1850); *Relevé de tous les écrits périodiques qui se publient dans le royaume de Belgique* (1875); *Catalogue des journaux, revues, et publications périodiques de la Belgique* (1910); *Revue bibliographique belge*.

Holland

The first serial written in Dutch was the *Boekzaal van Europa* (1692–1708, and 1715–1748), which had several changes of name

and their relative vices. In his doctrine of virtue the distinctive Peripatetic position regarding the importance of external goods was defended by him with emphasis against the assaults of the Stoics. He appears to have laid even more stress on this point than Aristotle himself, being doubtless led to do so, partly by the heat of controversy and partly by the importance which leisure and freedom from harassing cares naturally assumed to a man of his studious temperament. The metaphysical ἀπορίαι of Theophrastus which have come down to us show that he was fully alive to the difficulties that beset many of the Aristotelian definitions. But we are ignorant how he proposed to meet his own criticisms; and they do not appear to have suggested to him an actual departure from his master's doctrine, much less any radical transformation of it. In the difficulties which he raises we may perhaps detect a leaning towards a naturalistic interpretation. The tendency of Eudemus, on the other hand, is more towards the theological or Platonic side of Aristotle's philosophy. The *Eudemian Ethics* (which, with the possible exception of the three books common to this treatise and the *Nicomachean Ethics*, there need be no hesitation in ascribing to Eudemus) expressly identify Aristotle's ultimate ethical ideal of θεωρία with the knowledge and contemplation of God. And this supplies Eudemus with a standard for the determination of the mean by reason, which Aristotle demanded, but himself left vague. Whatever furthers us in our progress towards a knowledge of God is good; every hindrance is evil. The same spirit may be traced in the author of the chapters which appear as an appendix to book i. of Aristotle's *Metaphysics*. They have been attributed to Pasicles, the nephew of Eudemus. For the rest, Eudemus shows even less philosophical independence than Theophrastus. Among the Peripatetics of the first generation who had been personal disciples of Aristotle, the other chief names are those of Aristoxenus (*q.v.*) of Tarentum and Dicaearchus (*q.v.*) of Messene. Aristoxenus, who had formerly belonged to the Pythagorean school, maintained the position, already combated by Plato in the *Phaedo*, that the soul is to be regarded as nothing more than the harmony of the body. Dicaearchus agreed with his friend in this naturalistic rendering of the Aristotelian entelechy, and is recorded to have argued formally against the immortality of the soul.

Eudemus of Rhodes.

The naturalistic tendency of the school reached its full expression in Strato of Lampsacus, the most independent, and probably the ablest, of the earlier Peripatetics. His system is based upon the formal denial of a transcendent deity. Cicero attributes to him the saying that he did not require the aid of the gods in the construction of the universe; in other words, he reduced the formation of the world to the operation of natural forces. We have evidence that he did not substitute an immanent world-soul for Aristotle's extra-mundane deity; he recognized nothing beyond natural necessity. He was at issue, however, with the atomistic materialism of Democritus in regard to its twin assumptions of absolute atoms and infinite space. His own speculations led him rather to lay stress on the qualitative aspect of the world. The true explanation of things was to be found, according to Strato, in the forces which produced their attributes, and he followed Aristotle in deducing all phenomena from the fundamental attributes or elements of heat and cold. His psychological doctrine explained all the functions of the soul as modes of motion, and denied any separation of the reason from the faculties of sense-perception. He appealed in this connexion to the statement of Aristotle that we are unable to think without a sense-image.

Strato of Lampsacus.

The successors of Strato in the headship of the Lyceum were Lyco, Aristo of Ceos, Critolaus (*q.v.*), Diodorus of Tyre, and Erymneus, who brings the philosophic succession down to about 100 B.C. Other Peripatetics belonging to this period are Hieronymus of Rhodes, Prytanis and Phormio of Ephesus, the *delirus senex* who attempted to instruct Hannibal in the art of war (Cic. *De orat.* ii. 18). Sotion, Hermippus and Satyrus were historians rather than philosophers. Heraclides Lembus, Agatharchides and Antisthenes of Rhodes are names to us and nothing more. The fact is that, after Strato, the Peripatetic school has no thinker of any note for about 200 years.

Early in the 1st century B.C. all the philosophic schools began to be invaded by a spirit of eclecticism. This was partly due to the influence of the practical Roman spirit. This influence is illustrated by the proconsul Lucius Gellius Publicola (about 70 B.C.), who proposed to the representatives of the schools in Athens that he should help them to settle their differences (Cic. *De leg.* i. 20). This atmosphere of indifference imperceptibly influenced the attitude of the contending schools to one another, and we find various movements towards unity in the views of Boethus the Stoic, Panaetius and Antiochus of Ascalon, founder of the so-called "Fifth Academy." Meanwhile the Peripatetic school may be said to have taken a new departure and a new lease of life. The impulse was due to Andronicus of Rhodes. His critical edition of Aristotle indicated to the later Peripatetics the direction in which they could profitably work, and the school devoted itself henceforth almost exclusively to the writing of commentaries on Aristotle, *e.g.* those of Boethus of Sidon, Aristo of Alexandria, Staseas, Cratippus, and Nicolaus of Damascus. The most interesting Peripatetic work of the period is the treatise *De mundo*, which is a good example within the Peripatetic school of the eclectic tendency which was then in the air. The admixture of Stoic elements is so great that some critics have attributed the work to a Stoic author; but the writer's Peripateticism seems to be the more fundamental constituent of his doctrine.

Andronicus.

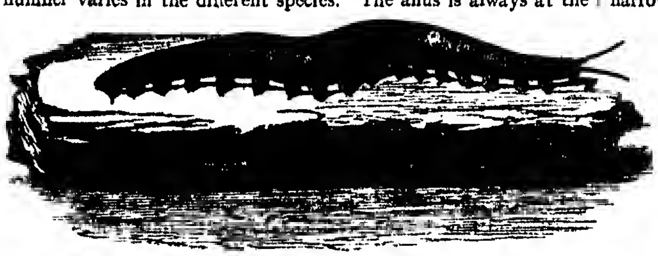
Our knowledge of the Peripatetic school during the first two centuries of the Christian era is very fragmentary; but those of its representatives of whom anything is known confined themselves entirely to commenting upon the different treatises of Aristotle. Thus Alexander of Aegae, the teacher of Nero, commented on the *Categories* and the *De caelo*. In the 2nd century Aspasius (*q.v.*) and Adrastus of Aphrodisias wrote numerous commentaries. The latter also treated of the order of the Aristotelian writings in a separate work. Somewhat later, Herminus, Achaicus and Sosigenes commented on the logical treatises. Aristocles of Messene, the teacher of Alexander of Aphrodisias, was the author of a complete critical history of Greek philosophy. This second phase of the activity of the school closes with the comprehensive labours of Alexander of Aphrodisias (Scholarch, *c.* 200), the exegete *par excellence*, called sometimes the second Aristotle. Alexander's interpretation proceeds throughout upon the naturalistic lines which have already become familiar to us. Aristotle had maintained that the individual alone is real, and had nevertheless asserted that the universal is the proper object of knowledge. Alexander seeks consistency by holding to the first position alone. The individual is prior to the universal, he says, not only "for us," but also in itself, and universals are abstractions which have merely a subjective existence in the intelligence which abstracts them. Even the deity must be brought under the conception of individual substance. Such an interpretation enables us to understand how it was possible, at a later date, for Aristotle to be regarded as the father of Nominalism. Form, Alexander proceeds, is everywhere indivisible from matter. Hence the soul is inseparable from the body whose soul or form it is. Reason or intellect is bound up with the other faculties. Alexander's commentaries formed the foundation of the Arabian and Scholastic study of Aristotle. Soon after Alexander's death the Peripatetic school was merged, like all others, in Neoplatonism (*q.v.*).

Alexander of Aphrodisias.

PERIPATUS, a genus of animals belonging to the air-breathing division of the phylum Arthropoda. It differs, however, from all other Arthropoda in such important respects that a special class, equivalent in rank to the old-established Arthropod classes, had been created for its sole occupancy. This class has been named the Prototracheata or Onychophora (see ARTHROPODA), and may be most appropriately placed in the system in the

neighbourhood of the Myriapoda, though it must not be forgotten that it differs from the Myriapoda more than the Myriapoda differ from other Arthropoda, and that in some respects it presents features which recall the segmented worms (Annelida). The genus has a wide distribution (see below), but it has not been found in Europe or in North America. There is but little variety of structure in the genus, and the species are limited in number. They live beneath the bark of trees, in the crevices of rock and of rotten stumps of trees, and beneath stones. They require a moist atmosphere, and are exceedingly susceptible to drought. They avoid light, and are therefore rarely seen. They move slowly, picking their course by means of their antennae. When irritated they eject with considerable force the contents of their slime reservoirs by means of the sudden contraction of the muscular body-wall. The slime, which appears to be harmless, is extremely sticky, but it easily comes away from the skin of the animal itself. Locomotion is effected by means of the legs, with the body fully extended. Hutton describes his specimens as sucking the juices of flies, which they had stuck down with their slime, and they have been observed in captivity to devour the entrails which have been removed from their fellows, and to eat raw sheep's liver. They move their mouths in a suctorial manner, tearing the food with their jaws. They have the power of extruding their jaws from the mouth, and of working them alternately backwards and forwards. They are viviparous; the young are fully formed at birth, and differ from the adult only in size and colour. The mother does not appear to pay any special attention to her offspring, which wander away and get their own living. It has lately been stated that some of the Australian species are normally oviparous, but this has not been fully proved. Sexual differences are not strongly marked, and are sometimes absent. There does not appear to be any true copulation. In some species the male deposits small oval spermatophores indiscriminately on any part of the body of the female. It seems probable that in such cases the spermatozoa make their way from the adherent spermatophore through the body-wall into the body, and so by traversing the tissues reach the ovary. In other species which possess *receptacula seminis* it is probable that fertilization is effected once only in early life before any ova pass into the uterus.

External Features.—The anterior part of the body may be called the head, though it is not sharply marked off from the rest of the body (fig. 1). The head carries three pairs of appendages, a pair of simple eyes, and a ventrally placed mouth. The body is elongated and vermiform; it bears a number of paired appendages, each terminating in a pair of claws, and all very much alike. The number varies in the different species. The anus is always at the



(After Sedgwick.)

FIG. 1.—*Peripatus capensis*, drawn from life. Life size.

posterior end of the body, and the generative opening is on the ventral surface, just in front of the anus; it may be between the legs of the penultimate pair, or between the legs of the last pair, or it may be subterminal. The colour varies considerably in the different species, and even in different individuals of the same species. The skin has a velvety appearance, and is thrown into a number of transverse ridges, along which wart-like papillae are placed. These papillae, which are found everywhere, are the *primary* papillae; they are covered with small, scale-like projections called *secondary* papillae, and are specially developed on the dorsal surface, less so on the ventral. Each papilla carries at its extremity a well-marked spine. Among the primary papillae smaller *accessory* papillae are sometimes present.

The appendages of the head are the antennae, the jaws and the oral papillae. The mouth is at the hinder end of a depression called the buccal cavity, and is surrounded by an annular tumid lip, raised into papilliform ridges and bearing a few spines (fig. 2). Within the buccal cavity are the two jaws. They are short, stump-like, muscular structures, armed at their free extremities by a pair of cutting blades or claws, and are placed one on each side of the mouth. In the median line of the buccal cavity in front is placed a thick muscular protuberance, which may be called the tongue, though attached to the dorsal instead of to the ventral wall of the mouth (fig. 2). The tongue bears a row of small, chitinous teeth. The jaw-claws (figs. 3 and 4), which resemble in all essential points the claws borne by the feet, and, like these, are thickenings of the cuticle, are sickle-shaped. They have their convex edge directed forwards, and their concave, or cutting edge, turned backwards. The inner cutting plate (fig. 3) usually bears a number of cutting teeth. The oral papillae are placed at the sides of the head (fig. 2). The ducts of the slime-glands open at their free end. They possess two main rings of projecting tissue, and their extremities bear papillae irregularly arranged. The ambulatory appendages vary in number. There are seventeen pairs in *P. capensis* and eighteen in *P. balfouri*, while in *P. jamaicensis* the number varies from twenty-nine to forty-three. They consist of two main divisions, which we may call the leg and the foot (fig. 5). The leg (*l*) has the form of a truncated cone, the broad end of which is attached to

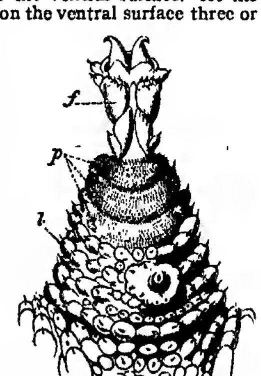
the ventro-lateral wall of the body, of which it is a prolongation. It is marked by a number of rings of papillae placed transversely to its long axis, the dorsal of which are pigmented like the dorsal surface of the body, and the ventral like the ventral surface. At the narrow distal end of the leg there are on the ventral surface three or four (rarely five) spiniferous pads, each of which is continued dorsally into a row of papillae. The foot is attached to the distal end of the leg. It is slightly narrower at its attached extremity than at its free end. It bears two sickle-shaped claws, and at its distal end three (rarely four) papillae. The part of the foot which carries the claws is especially retractile, and is generally found more or less telescoped into the proximal part. The legs of the fourth and fifth pairs differ from the others in the fact that the third pad (counting from the distal end of the leg) carries the opening of the enlarged nephridia of these segments. In some species certain of the legs bear on their ventral sides furrows with tumid lips and lined by smooth non-tuberculate epithelium; they are called coxal organs, and it appears that they can be everted. The males are generally rather smaller and less numerous than the females. In those species in which the number of legs varies the male has a smaller number of legs than the female.



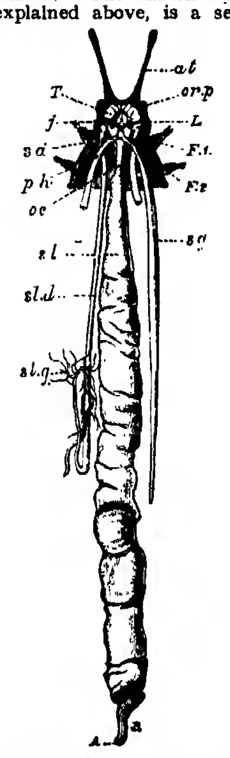
(After Sedgwick.)

FIG. 5.—Ventral view of last leg of a male *P. capensis*.

f, Foot; *l*, leg; *p*, spiniferous pads. The white papilla of the proximal part of this leg is characteristic of the male of this species.

Breeding.—As already stated, *Peripatus* is viviparous. The Australasian species come nearest to laying eggs, inasmuch as the eggs are large, full of yolk, and enclosed in a shell; but development normally takes place in the uterus, though abnormally, incompletely developed eggs are extruded. The uterus always contains several young, which are usually at different stages of development and are born at different times of the year. In most of the African species, however, the embryos of the uterus are almost of the same age and are born at a definite season. The young of *P. capensis* are born in April and May. They are almost colourless at birth, excepting the antennae, which are green, and their length is 10 to 15 mm. A large female will produce thirty to forty young in one year. The period of gestation is thirteen months, that is to say, the ova pass into the oviducts about one month before the young of the preceding year are born.

Anatomy.—The alimentary canal (fig. 6). The buccal cavity, as explained above, is a secondary formation around the true mouth, which is at its dorsal posterior end. It contains the tongue and the jaws, which have already been described, and into the hind end of it there open ventrally by a median opening the salivary glands. The mouth leads into a muscular pharynx, which is connected by a short oesophagus with the stomach. The stomach forms by far the largest part of the alimentary canal. It is a dilated soft-walled tube, and leads behind into the short narrow rectum, which opens at the anus. There are no glands opening into the alimentary canal. The central nervous system, the anterior part of which is shown in fig. 7, is of the "rope-ladder" type, and the ventral cords meet over the rectum. The cuticle is a thin layer, of which the spines, jaws and claws are special developments. Its surface is not, however, smooth, but is everywhere, with the exception of the perioral region, raised into minute secondary papillae, which in most instances bear at their free extremity a somewhat prominent spine. The epidermis, placed immediately within the cuticle, is composed of a single row of cells. The pigment which gives the characteristic colour to the skin is deposited in the protoplasm of the outer ends of the cells in the form of small granules. Beneath the epidermis is a thin cutis, which is followed by the muscular layers (external circular and internal longitudinal). The muscular fibres of the jaws are transversely striated, the other muscles are unstriated.



(After Balfour.)

FIG. 6.—*Peripatus capensis* dissected so as to show the alimentary canal, slime glands and salivary glands. The dissection is viewed from the ventral side, and the lips (*L*) have been cut through in the middle line behind and pulled outwards so as to expose the jaws (*j*), which have been turned outwards, and the tongue (*T*) bearing a median row of chitinous teeth, which branches behind into two. The muscular pharynx, extending back into the space between the first and second pairs of legs, is followed by a short tubular oesophagus. The latter opens into the large stomach with plicated walls, extending almost to the hind end of the animal. The stomach at its point of junction with the rectum presents an S-shaped ventro-dorsal curve.

The apertures of the tracheal system are placed in the depressions between the papillae or ridges of the skin. Each of them leads into a tube, which may be called the tracheal pit (fig. 8); the walls of this are formed of epithelial cells, bounded towards the lumen of the pit by a very delicate cuticular membrane continuous with the cuticle covering the surface of the body. Internally it expands in the transverse plane, and from the expanded portion the tracheal tubes arise in diverging bundles. The tracheae are minute tubes exhibiting a faint transverse striation which is probably the indication of a spiral fibre. They appear to branch, but only exceptionally. The tracheal apertures are diffused over the surface of the body, but are especially developed in certain regions.

(After Balfour.)

FIG. 8.—Section through a tracheal pit and diverging bundles of tracheal tubes taken transversely to the long axis of the body.

tr, Tracheae, showing rudimentary spiral fibre; *tr.c*, Cells resembling those lining the tracheal pits, which occur at intervals along the course of the tracheae; *tr.o*, Tracheal stigma; *tr.p*, Tracheal pit.

The vascular system consists of a dorsal tubular heart with paired ostia leading into it from the pericardium, of the pericardium, and the various other divisions of the perivisceral cavity (fig. 12, D). As in all Arthropoda, the perivisceral cavity is a haemocoele, *i.e.* contains blood, and forms part of the vascular system. It is divided by septa into chambers (fig. 12, D), of which the most important are the central chamber containing the alimentary canal and the dorsal chamber or pericardium. Nephridia are present in all the legs. In all of them (except the first three) the following parts may be recognized (fig. 9): (1) a vesicular portion

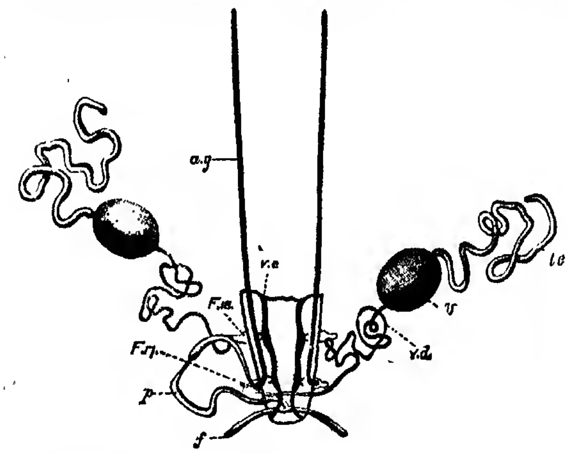
(*s*) opening to the exterior on the ventral surface of the legs by a narrow passage (*s.d*); (2) a coiled portion, which is again subdivided into several sections (*s.c*); (3) a section with closely-packed nuclei ending by a somewhat enlarged opening (*p.f*); (4) the terminal portion, which consists of a thin-walled vesicle. The nephridia of the first three pairs of legs are smaller than the rest, consisting only of a vesicle and duct. The fourth and fifth pairs are larger than those behind, and are in other respects peculiar; for instance, they open on the third pad (counting from the distal end of the

leg), and the external vesicular portion is not dilated. The external opening of the other nephridia is placed at the outer end of a transverse groove at the base of the legs. The salivary glands are the modified nephridia of the segment of the oral papillae.

The male generative organs (fig. 10) consist of a pair of testes (*te*), a pair of seminal vesicles (*v*), vasa deferentia (*v.d.*), and accessory glandular tubules (*f*). All the above parts lie in the central



(After Balfour.)

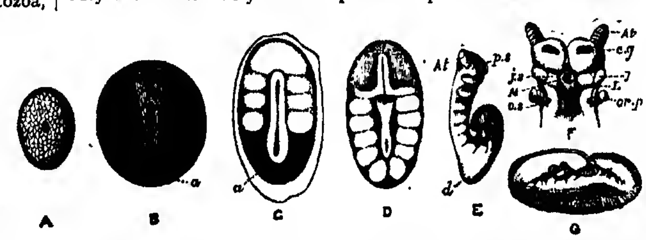
compartment of the body cavity. The ovaries consist of a pair of tubes closely applied together, and continued posteriorly into the oviducts. Each oviduct, after a short course, becomes dilated into the uterus. The two uteri join behind and open to the exterior by a median opening. The ovaries always contain spermatozoa, some of which project through the ovarian wall into the body cavity. Spermatozoa are not found in the uterus and oviducts, and it appears probable, as we have said, that they reach the ovary directly by boring through the skin and traversing the body cavity. In all the species except the African species there is a globular receptaculum seminis opening by two short ducts close together into the oviduct, and in the neotropical species there is in addition a small receptaculum ovorum, with extremely thin walls, opening into the oviduct by a short duct just in front of the receptaculum seminis. The epithelium of the latter structure is clothed with actively moving cilia. There appear to be present in most, if not all, of the legs some accessory glandular structures opening just externally to the nephridia. They are called the crural glands.

Development.—*Peripatus* is found in Africa, in Australasia, in South America and the West Indies, in New Britain, and in the Malay Peninsula and Sumatra. The species found in these various localities are closely similar in their anatomical characters, the principal differences relating to the structure of the female generative organs and to the number of the legs. They, however, differ in the most striking manner in the structure of the ovum and the early development. In all the Australasian species the egg is large and heavily charged with food-yolk, and is surrounded by a tough membrane. In the Cape species the eggs are smaller, though still of considerable size; the yolk is much less developed, and the egg membrane is thinner though dense. In the New Britain species the egg is still smaller (·1 mm.), and there is a large trophic vesicle. In the neotropical species the egg is minute, and almost entirely devoid of yolk. The unsegmented uterine ovum of *P. novae zealandiae* measures 1·5 mm. in length by ·8 mm. in breadth; that of *P. capensis* is ·56 mm. in length; and that of *P. trinidadensis* ·04 mm. in diameter. In correspondence with these differences in the ovum there are differences in the early development, though the later stages are closely similar.

The development has been worked out in *P. capensis*, to which species the following description refers. The segmentation is peculiar, and leads to the formation of a solid gastrula, consisting of a cortex of ectoderm nuclei surrounding a central endodermal mass, which is exposed at one point—the blastopore. The enteron arises as a space in the endoderm, and an opacity—the primitive streak—appears at the hind end of the blastopore (fig. 11, B). The elongation of the embryo is accompanied by an elongation of the blastopore, which soon becomes dumb-bell shaped (fig. 11, C). At the same time the mesoblastic somites (embryonic segments of mesoderm) make their appearance in pairs at the hind end, and gradually travel forwards on each side of the blastopore to the front end, where the somites of the anterior pair soon meet in front of the blastopore (fig. 11, D). Meanwhile the narrow middle part of the blastopore has closed by a fusion of its lips, so that the blastopore is represented by two openings, the future mouth and anus. A primitive groove makes its appearance behind the blastopore (fig. 11, D). At this stage the hind end of the body becomes curved ventrally into a spiral (fig. 11, E), and at the same time the appendages appear as hollow processes of the body-wall, a mesoblastic somite being prolonged into each of them. The first to appear are the antennae, into which the praeoral somites are prolonged. The remainder appear from before backwards in regular order, viz. jaw, oral papillae, legs 1–17. The full number of somites and their appendages is not, however, completed until a later stage. The nervous system is formed as an annular thickening of ectoderm passing in front of the mouth and behind the anus, and lying on each side of the blastopore along the lines of the somites. The praeoral part of this thickening, which gives rise to the cerebral ganglia, becomes pitted inwards on each side (fig. 11, F, *c.g.*). These pits are eventually closed, and form the hollow ventral appendages of the supraphatyngeal ganglia of the adult (fig. 7, *d*). The lips are formed as folds of the side wall of the body, extending from the praeoral lobes to just behind the jaw (fig. 11, F, *L*). They enclose the jaws (*j*), mouth (*M*), and opening of the salivary glands (*o.s*), and so give rise to the buccal cavity. The embryo has now lost its spiral curvature, and becomes completely doubled upon itself, the hind end being in contact with the mouth (fig. 11, G). It remains in this position until birth. The just-born young are from 10 to 15 mm. in length, and have green antennae, but the rest of the body is either quite white or of a reddish colour. This red colour differs from the colour of the adult in being soluble in spirit. The mesoblastic somites are paired sacs formed from the anterior lateral portions of the primitive streak (fig. 11, C). As they are formed they become placed in pairs on each side of the



(After Sedgwick.)

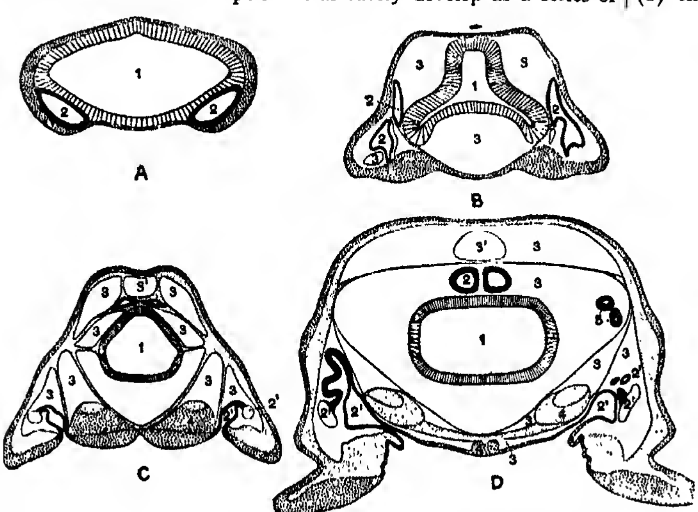
D, Ventral view of embryo, in which the blastopore has completely closed in its middle portion. The anterior pair of somites have moved to the front end of the body.
E, Side view of later embryo. *At*, Antenna; *d*, dorsal projection; *p.s.*, praeoral somite.
F, Ventral view of head of embryo, intermediate between E and G. *At*, Antennae; *c.g*, cerebral groove; *j*, jaws; *j.s.* swelling at base of jaws; *L*, lips; *M*, mouth; *or.p*, oral papillae; *o.s*, opening of salivary gland.
G, side view of older embryo.

blastopore. The somites of the first pair eventually obtain a position entirely in front of the blastopore (fig. 11, D). They form the somites of the praeoral lobes. The full complement of somites is acquired at about the stage of fig. 11, E. The relations of the mesoblastic somites are shown in fig. 12, A, which represents a transverse section taken between the mouth and anus of an embryo of the stage of fig. 11, D. The history of these somites is an exceedingly interesting one, and may be described shortly as follows: They divide into two parts—a ventral part which extends into the appendage, and a dorsal part (fig. 12, B). Each of the ventral parts acquires an opening to the exterior, just outside the nerve-cord,

and becomes entirely transformed into a nephridium (fig. 12, D, 2'). The dorsal part shifts dorsalwards and diminishes relatively in size (fig. 12, C). Its fate differs in the different parts of the body. In the anterior somites it dwindles and disappears, but in the posterior part it unites with the dorsal divisions of contiguous somites of the same side, and forms a tube—the generative tube (fig. 12, D, 2). The last section of this tube retains its connexion with the ventral portion of the somite, and so acquires an external opening, which is at first lateral, but soon shifts to the middle line, and fuses with its fellow, to form the single generative opening. The praeoral somite develops the rudiment of a nephridium, but eventually entirely disappears. The jaw somite also disappears; the oral papilla somite forms ventrally the salivary glands, which are thus serially homologous with nephridia. The various divisions of the perivisceral cavity develop as a series of spaces between the ectoderm and endoderm, and later in the mesoderm. The mesoderm seems to be formed entirely from the proliferation of the cells of the mesoblastic somites. It thus appears that in *Peripatus* the coelom does not develop a perivisceral portion, but gives rise only to the renal and reproductive organs.



(After Sedgwick.)

FIG. 12.—A series of diagrams of tranverse sections through *Peripatus* embryos to show the relations of the coelom at successive stages.

A, Early stage; no trace of the vascular space; endoderm and ectoderm in contact.

B, Endoderm has separated from the dorsal and ventral ectoderm. The somite is represented as having divided on the left side into a dorsal and ventral portion.

C, The haemocoele (3) has become divided up into a number of spaces, the arrangement of which is unimportant. The dorsal part of the somite has travelled dorsalwards, and now constitutes a small space (triangular in section) just dorsal to the gut. The ventral portion (2) has assumed a tubular character, and has acquired an external opening. The internal vesicle is already indicated, and is shown in the diagram by the thinner black line: 1, gut; 2, somite; 2', nephridial part of coelom; 3, haemocoele; 3', part of haemocoele which will form the heart—the part of the haemocoele on each side of this will form the pericardium; 4, nerve-cord; 5, slime glands.

D represents the conditions at the time of birth. The coelom is represented as surrounded by a thick black line, except in the part which forms the internal vesicle of the nephridium.

The genus *Peripatus* was established in 1826 by L. Guilding, who first obtained specimens of it from St Vincent in the Antilles. He regarded it as a mollusc, being no doubt deceived by the slug-like appearance given by the antennae. Specimens were subsequently obtained from other parts of the neotropical region, and from South Africa and Australia, and the animal was variously assigned by the zoologists of the day to the Annelida and Myriapoda. Its true place in the system, as a primitive member of the group Arthropoda, was first established in 1874 by H. N. Moseley, who discovered the tracheae. *Peripatus* is an Arthropod, as shown by (1) the presence of appendages modified as jaws; (2) the presence of paired lateral ostia perforating the wall of heart and putting its cavity in communication with the pericardium; (3) the presence of a vascular body cavity and pericardium (haemocoelic body cavity); (4) absence of a perivisceral section of the coelom. Finally, the tracheae, though not characteristic of all the classes of the Arthropoda, are found nowhere outside that group, and constitute a very important additional reason for uniting *Peripatus* with it. *Peripatus*, though indubitably an Arthropod, differs in such important respects from all the old-established Arthropod classes, that a special class, equivalent in rank to the others, and called Prototracheata or Onychophora, has had, as we have seen, to be created for its sole occupancy. This unlikeness to other Arthropoda is mainly due to the Annelidan affinities which it presents, but in part to the presence of the following peculiar features: (1) the number and diffusion of the tracheal apertures; (2) the restriction of the jaws to a single pair; (3) the disposition of the generative organs; (4) the texture of the skin; and (5) the simplicity and similarity of all the segments of the body behind the head. The Annelidan affinities are superficially indicated in so marked a manner by the thinness of the cuticle, the dermo-muscular body-wall, the hollow appendages, that, as already stated, many of the earlier zoologists who examined *Peripatus* placed it among the segmented worms; and the discovery that there is some solid morphological basis for this determination constitutes one of the most interesting points of the recent work on the genus. The Annelidan features are: (1) the paired nephridia in every segment of the body behind the first two (Saenger, Balfour); (2) the presence of cilia in the generative tracts (Gaffron). It is true that neither of these features is absolutely distinctive of the Annelida, but when taken in conjunction with the Annelidan disposition of the chief systems of organs, viz. the central nervous system, and the main vascular trunk or heart, they may be considered as indicating affinities in that direction.

SYNOPSIS OF SPECIES

PERIPATUS (Guilding).—Soft-bodied vermiform animals, with one pair of ringed antennae, one pair of jaws, one pair of oral papillae, and a varying number of claw-bearing ambulatory legs. Dorsal surface arched and more darkly pigmented than the flat ventral surface. Skin transversely ridged and beset by wart-like spiniferous papillae. Mouth anterior, ventral; anus posterior, terminal. Generative opening single, median, ventral and posterior. One pair of simple eyes. Brain large, with two ventral hollow appendages; ventral cords widely divaricated, without distinct ganglia. Alimentary canal simple, uncoiled. Segmentally arranged paired nephridia are present. Body cavity is continuous with the vascular system, and does not communicate with the paired nephridia. Heart tubular, with paired ostia. Respiration by means of tracheae. Dioecious; males smaller and generally less numerous than females. Generative glands tubular, continuous with the ducts. Viviparous. Young born fully developed. Distribution: Africa (Cape Colony, Natal, and the Gaboon), New Zealand, Australia and Tasmania, New Britain, South and Central America and the West Indies, the Malay Peninsula [and in Sumatra ?].

The genus *Peripatus*, so far as adult conformation is concerned, is a very homogeneous one. It is true, as was pointed out by Sedgwick, that the species from the same part of the world resemble one another more closely than they do species from other regions, but recent researches have shown that the line between them cannot be so sharply drawn as was at first supposed, and it is certainly not desirable in the present state of our knowledge to divide them into generic or subgeneric groups, as has been done by some zoologists. (The following genera have been proposed: *Peripatus* for the neotropical species, *Peripatoides* for the Australasian, *Peripatopsis* and *Opisthopatus* for the African, *Paraperipatus* for the New Britain, *Eoperipatus* for the Malayan species, and *Ooperipatus* for the supposed oviparous species of Australia and New Zealand.) The colour is highly variable in species from all regions; it is perhaps more constant in the species from the neotropical region than in those from elsewhere. The number of legs tends to be variable whenever it exceeds 19 praegenital pairs; when the number is less than that it is usually, though not always, constant. More constant points of difference are the form of the jaws, the position of the generative orifice, the presence of a receptaculum seminis and a receptaculum ovorum, the arrangement of the primary papillae on the distal end of the feet, and above all the early development.

South African Species.—With three spinous pads on the legs,

and feet with two primary papillae on the anterior side and one on the posterior side; outer jaw with one minor tooth at the base of the main tooth, inner jaw with no interval between the large tooth and the series of small ones; last fully developed leg of the male with enlarged crural gland opening on a large papilla placed on its ventral surface; coxal organs absent; the nephridial openings of the 4th and 5th pairs of legs are placed in the proximal spinous pad. Genital opening subterminal, behind the last pair of fully developed legs; oviduct without receptacula seminis or receptacula ovorum; the terminal unpaired portion of vas deferens short. Ova of considerable size, but with only a small quantity of yolk. The embryos in the uterus are all nearly of the same age, except for a month or two before birth, when two broods overlap.

The following species are aberrant in respect of these characters: *Peripatus (Opisthopatus) cinctipes*, Purcell (Cape Colony and Natal), presents a few Australasian features; there is a small receptaculum seminis on each oviduct, some of the legs are provided with well-developed coxal organs, the feet have one anterior, one posterior and one dorsal papilla, and the successive difference in the ages of the embryos in the uterus, though nothing like that found in the neotropical species, is slightly greater than that found in other investigated African species. Several pairs of legs in the middle region of the body are provided with enlarged crural glands which open on a large papilla. Male with four accessory glands, opening on each side of and behind the genital aperture. *P. tholloni*, Bouvier, (Equatorial West Africa [Gaboon]), shows some neotropical features; there are 24 to 25 pairs of legs, the genital opening is between the penultimate legs, and though there are only three spinous pads the nephridial openings of the 4th and 5th legs are proximal to the 3rd pad, coxal organs are present, and the jaws are of the neotropical type; the oviducts have receptacula seminis. The following South African species may be mentioned: *P. capensis* (Grube), with 17 (rarely 18) pairs of claw-bearing legs; *P. balfouri* (Sedgw.) with 18 (rarely 19) pairs; *P. moseleyi* (Wood-M.), with 20 to 24 pairs.

Australasian Species.—With 14, 15 or 16 pairs of claw-bearing ambulatory legs, with three spinous pads on the legs, and nephridial opening of the 4th and 5th legs on the proximal pad; feet with one anterior, one posterior and one dorsal primary papilla; inner jaw without diastema, outer with or without a minor tooth. Last leg of the male with or without a large white papilla on its ventral surface for the opening of a gland, and marked papillae for the crural glands are sometimes present on other legs of the male; well-developed coxal glands absent. Genital opening between the legs of the last pair; oviducts with receptacula seminis, without receptacula ovorum; the terminal portion of the vas deferens long and complicated; the accessory male glands open between the genital aperture and the anus, near the latter. Ova large and heavily charged with yolk, and provided with a stoutish shell. The uterus appears to contain embryos of different ages. Specimens are recorded from West Australia, Queensland, New South Wales, Victoria and New Zealand. The Australasian species are in some confusion. The number of claw-bearing legs varies from 14 to 16 pairs, but the number most often found is 15. Whether the number varies in the same species is not clear. There appears to be evidence that some species are occasionally or normally oviparous, and in the supposed oviparous species the oviduct opens at the end of a papilla called from its supposed function an ovipositor, but the oviparity has not yet been certainly proved as a normal occurrence. Among the species described may be mentioned *P. leuckarti* (Saenger), *P. insignis* (Dendy), *P. oviparus* (Dendy), *P. viridimaculatus* (Dendy), *P. novae zealandiae* (Hutton), but it is by no means certain that future research will maintain these. Mr J. J. Fletcher, indeed, is of opinion that the Australian forms are all varieties of one species, *P. leuckarti*.

Neotropical Species.—With three to five spinous pads on the legs, nephridial opening of the 4th and 5th legs usually proximal to the 3rd pad, and feet either with two primary papillae on the anterior side and one on the posterior, or with two on the anterior and two on the posterior; outer jaw with small minor tooth or teeth at the base of the main tooth, inner jaw with diastema. A variable number of posterior legs of the males anterior to the genital opening with one or two large papillae carrying the openings of the crural glands; well-developed coxal organs present on most of the legs. The primary papillae usually divided into two portions. Genital opening between the legs of the penultimate pair; oviduct provided with receptacula seminis and ovorum; unpaired part of vas deferens long and complicated; accessory organs of male opening at the sides of the anus. Ova minute, with little food-yolk; embryos in the uterus at very different stages of development. The number of legs usually if not always variable in the same species; the usual number is 28 to 32 pairs, but in some species 40 to 43 pairs are found. The neotropical species appear to fall into two groups: (1) the so-called Andean species, viz. those which inhabit the high plateaus or Pacific slope of the Andes; in these there are 4 (sometimes 5) pedal papillae, and the nephridial openings of the 4th and 5th legs are on the third pad; and (2) the Caribbean species, viz. the remaining neotropical species, in which there are 3 papillae on the foot and the nephridial openings of the 4th and 5th legs are between the 3rd and 4th pads. The Andean species are *P. eisenii* (Wh.), *P. tuberculatus* (Bouv.), *P. lankesteri* (Bouv.), *P. quitensis* (Schm.), *P. corradi* (Cam.), *P. cameranoi* (Bouv.) and *P. balzani* (Cam.). Of the remaining species, which are the majority, may be mentioned *P. edwardsii* (Blanch), *P. jamaicensis* (Gr. and Cock.), *P. trinidadensis* (Sedgw.), *P. torquatus* (Ken.), *P. im thurmi* (Scl.).

New Britain Peripatus.—With 22 to 24 pairs of claw-bearing legs, with three spinous pads on the legs, and nephridial openings of legs 4 and 5 (sometimes of 6 also) on the proximal pad; feet with one primary papilla on the anterior, one on the posterior side, and one on the dorsal side (median or submedian); outer jaw with a minor tooth, inner jaw without diastema; crural glands absent; well-developed coxal organs absent. Genital opening subterminal behind the last pair of legs; oviduct with receptaculum seminis, without receptaculum ovorum; unpaired part of vas deferens very short; accessory glands two, opening medianly and dorsally. Ova small, ·1 mm. in diameter, with little yolk, and the embryos provided with large trophic vesicles (Willey). Embryos in the uterus of very different ages, and probably born all the year round. One species only known, *P. novae britanniae* (Willey).

Sumatran Peripatus.—Peripatus with 24 pairs of ambulatory legs, and four spinous pads on the legs. The primary papillae of the neotropical character with conical bases. Generative opening between the legs of the penultimate pair. Feet with only two papillae. Single species. *P. sumatranus* (Sedgw.). The existence of this species is doubtful.

Peripatus from the Malay Peninsula.—With 23 to 25 pairs of claw-bearing legs, four spinous pads on the legs, and nephridial openings of legs 4 and 5 in the middle of the proximal pad or on its proximal side; feet with two primary papillae, one anterior and one posterior; outer jaw with two, inner jaw with two or three minor teeth at the base of the main tooth, separated by a diastema from the row of small teeth; crural glands present in the male only, in the two pairs of legs preceding the generative opening; coxal glands present. Genital opening between the penultimate legs; oviduct with receptacula seminis and ovorum; unpaired part of vas deferens long; male accessory glands two, opening medianly between the legs of the last pair. Ova large, with much yolk and thick membrane, like those of Australasian species; embryos with slit-like blastopore and of very different ages in the same uterus, probably born all the year round. The species are *P. weldoni* (Evans), *P. horsti* (Evans) and *P. butleri* (Evans). It will thus be seen that the Malay species, while resembling the neotropical species in the generative organs, differ from these in many features of the legs and feet, in the important characters furnished by the size and structure of the ovum, and by their early development.

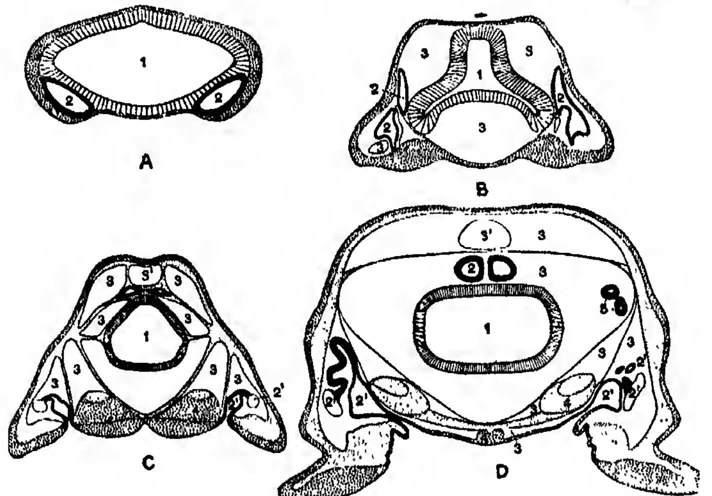
and becomes entirely transformed into a nephridium (fig. 12, D, 2'). The dorsal part shifts dorsalwards and diminishes relatively in size (fig. 12, C). Its fate differs in the different parts of the body. In the anterior somites it dwindles and disappears, but in the posterior part it unites with the dorsal divisions of contiguous somites of the same side, and forms a tube—the generative tube (fig. 12, D, 2). The last section of this tube retains its connexion with the ventral portion of the somite, and so acquires an external opening, which is at first lateral, but soon shifts to the middle line, and fuses with its fellow, to form the single generative opening. The praeoral somite develops the rudiment of a nephridium, but eventually entirely disappears. The jaw somite also disappears; the oral papilla somite forms ventrally the salivary glands, which are thus serially homologous with nephridia. The various divisions of the perivisceral cavity develop as a series of



(After Sedgwick.)

FIG. 12.—A series of diagrams of tranverse sections through *Peripatus* embryos to show the relations of the coelom at successive stages.

A, Early stage; no trace of the vascular space; endoderm and ectoderm in contact.

B, Endoderm has separated from the dorsal and ventral ectoderm. The somite is represented as having divided on the left side into a dorsal and ventral portion.

C, The haemocoele (3) has become divided up into a number of spaces, the arrangement of which is unimportant. The dorsal part of the somite has travelled dorsalwards, and now constitutes a small space (triangular in section) just dorsal to the gut. The ventral portion (2) has assumed a tubular character, and has acquired an external opening. The internal vesicle is already indicated, and is shown in the diagram by the thinner black line: 1, gut; 2, somite; 2', nephridial part of coelom; 3, haemocoele; 3', part of haemocoele which will form the heart—the part of the haemocoele on each side of this will form the pericardium; 4, nerve-cord; 5, slime glands.

D represents the conditions at the time of birth. The coelom is represented as surrounded by a thick black line, except in the part which forms the internal vesicle of the nephridium.

spaces between the ectoderm and endoderm, and later in the mesoderm. The mesoderm seems to be formed entirely from the proliferation of the cells of the mesoblastic somites. It thus appears that in *Peripatus* the coelom does not develop a perivisceral portion, but gives rise only to the renal and reproductive organs.

The genus *Peripatus* was established in 1826 by L. Guilding, who first obtained specimens of it from St Vincent in the Antilles. He regarded it as a mollusc, being no doubt deceived by the slug-like appearance given by the antennae. Specimens were subsequently obtained from other parts of the neotropical region, and from South Africa and Australia, and the animal was variously assigned by the zoologists of the day to the Annelida and Myriapoda. Its true place in the system, as a primitive member of the group Arthropoda, was first established in 1874 by H. N. Moseley, who discovered the tracheae. *Peripatus* is an Arthropod, as shown by (1) the presence of appendages modified as jaws; (2) the presence of paired lateral ostia perforating the wall of heart and putting its cavity in communication with the pericardium; (3) the presence of a vascular body cavity and pericardium (haemocoelic body cavity); (4) absence of a perivisceral section of the coelom. Finally, the tracheae, though not characteristic of all the classes of the Arthropoda, are found nowhere outside that group, and constitute a very important additional reason for uniting *Peripatus* with it. *Peripatus*, though indubitably an Arthropod, differs in such important respects from all the old-established Arthropod classes, that a special class, equivalent in rank to the others, and called Prototracheata or Onychophora, has had, as we have seen, to be created for its sole occupancy. This unlikeness to other Arthropoda is mainly due to the Annelidan affinities which it presents, but in part to the presence of the following peculiar features: (1) the number and diffusion of the tracheal apertures; (2) the restriction of the jaws to a single pair; (3) the disposition of the generative organs; (4) the texture of the skin; and (5) the simplicity and similarity of all the segments of the body behind the head. The Annelidan affinities are superficially indicated in so marked a manner by the thinness of the cuticle, the dermo-muscular body-wall, the hollow appendages, that, as already stated, many of the earlier zoologists who examined *Peripatus* placed it among the segmented worms; and the discovery that there is some solid morphological basis for this determination constitutes one of the most interesting points of the recent work on the genus. The Annelidan features are: (1) the paired nephridia in every segment of the body behind the first two (Saenger, Balfour); (2) the presence of cilia in the generative tracts (Gaffron). It is true that neither of these features is absolutely distinctive of the Annelida, but when taken in conjunction with the Annelidan disposition of the chief systems of organs, viz. the central nervous system, and the main vascular trunk or heart, they may be considered as indicating affinities in that direction.

Synopsis of Species

PERIPATUS (Guilding).—Soft-bodied vermiform animals, with one pair of ringed antennae, one pair of jaws, one pair of oral papillae, and a varying number of claw-bearing ambulatory legs. Dorsal surface arched and more darkly pigmented than the flat ventral surface. Skin transversely ridged and beset by wart-like spiniferous papillae. Mouth anterior, ventral; anus posterior, terminal. Generative opening single, median, ventral and posterior. One pair of simple eyes. Brain large, with two ventral hollow appendages; ventral cords widely divaricated, without distinct ganglia. Alimentary canal simple, uncoiled. Segmentally arranged paired nephridia are present. Body cavity is continuous with the vascular system, and does not communicate with the paired nephridia. Heart tubular, with paired ostia. Respiration by means of tracheae. Dioecious; males smaller and generally less numerous than females. Generative glands tubular, continuous with the ducts. Viviparous. Young born fully developed. Distribution: Africa (Cape Colony, Natal, and the Gaboon), New Zealand, Australia and Tasmania, New Britain, South and Central America and the West Indies, the Malay Peninsula [and in Sumatra ?].

The genus *Peripatus*, so far as adult conformation is concerned, is a very homogeneous one. It is true, as was pointed out by Sedgwick, that the species from the same part of the world resemble one another more closely than they do species from other regions, but recent researches have shown that the line between them cannot be so sharply drawn as was at first supposed, and it is certainly not desirable in the present state of our knowledge to divide them into generic or subgeneric groups, as has been done by some zoologists. (The following genera have been proposed: *Peripatus* for the neotropical species, *Peripatoides* for the Australasian, *Peripatopsis* and *Opisthopatus* for the African, *Paraperipatus* for the New Britain, *Eoperipatus* for the Malayan species, and *Ooperipatus* for the supposed oviparous species of Australia and New Zealand.) The colour is highly variable in species from all regions; it is perhaps more constant in the species from the neotropical region than in those from elsewhere. The number of legs tends to be variable whenever it exceeds 19 praegenital pairs; when the number is less than that it is usually, though not always, constant. More constant points of difference are the form of the jaws, the position of the generative orifice, the presence of a receptaculum seminis and a receptaculum ovorum, the arrangement of the primary papillae on the distal end of the feet, and above all the early development.

South African Species.—With three spinous pads on the legs,

Oligocene of both hemispheres appears *Protapirus*, which ranges well into the Miocene, and is essentially a tapir, having lost the third lobe of the last lower molar, and being in process of acquiring molar-like upper premolars, although none of these teeth have two complete inner columns. Finally, *Tapirus* itself, in which the last three upper premolars, makes its appearance in the Upper Miocene, and continues till the present day. The characters of the genus may be expressed as follows in a more detailed manner.

The dentition is *i* $\frac{3}{3}$, *c* $\frac{1}{1}$, *p* $\frac{4}{4}$, *m* $\frac{3}{3}$, total 42. Of the upper incisors the first and second are nearly equal, with short, broad crowns, the third is large and conical, considerably larger than the canine, which is separated from it by an interval. Lower incisors diminishing in size from the first to the third; the canine, which is in contact with the third incisor, large and conical, working against (and behind) the canine-like third upper incisor. In both jaws there is a long space between the canines and the commencement of the teeth of the cheek-series, which are all in contact. First upper premolar with a triangular crown narrow in front owing to the absence of the anterior inner column. The other upper premolars and molars all formed on the same plan and of nearly the same size, with four roots and quadrate crowns, rather wider transversely than from before backwards, each having four columns, connected by a pair of transverse ridges, anterior and posterior. The first lower premolar compressed in front; the others composed of a single pair of transverse crests, with a small anterior and posterior basal ridge. Skull elevated and compressed; with the orbit and temporal fossa widely continuous, there being no true post-orbital process from the frontal bone. Nasal apertures very large, and extending high on the face between the orbits; nasal bones short, elevated, triangular and pointed in front. Vertebrae: cervical, 7; dorsal, 18; lumbar, 5; sacral, 6; caudal about 12. Limbs short and stout. Fore-feet with four toes, having distinct hoofs: the first toe being absent, the third the longest, the second and fourth nearly equal, and the fifth the shortest and scarcely reaching the ground in the ordinary standing position. Hind-feet with the typical perissodactyle arrangement of three toes—the middle one being the largest, the two others nearly equal. Nose and upper lip elongated into a flexible, mobile snout or short proboscis, near the end of which the nostrils are situated. Eyes rather small. Ears of moderate size, ovate, erect. Tail very short. Skin thick and but scantily covered with hair. Tapirs are common to the Malay countries and tropical America; two species from the latter area differ from the rest in having a vertical bony partition to the nasal septum, and are hence subgenerically or generically separated as *Tapirella* (*Elasmognathus*) (see TAPIR). Nearly related is the extinct family *Lophiodontidae* (inclusive of the American *Helaletidae*), in which both the upper and lower first premolar may be absent, while the upper molars present a more rhinoceros-like form, owing to the lateral compression and consequent lengthening of the outer columns, of which the hinder is bent somewhat inwards and is more or less concave externally, thus forming a more complete outer wall. In America the family is represented by *Heptodon*, of the Middle Eocene, which differs from the early members of the tapir-stock in having a long gap between the lower canine and first premolar; the dentition is complete, and the upper premolars are simple. The next stage is *Helaletes*, also of Middle Eocene age, in which the first lower premolar has disappeared, and the last two upper premolars have become molar-like. Finally, in the Oligocene *Colodon* the last three upper premolars are like the molars, and the first pair of lower incisors is lost. In Europe the group is represented by the long-known and typical genus *Lophiodon* with three premolars in each jaw, of which the upper are simpler than the molars. The genus is especially characteristic of the Middle and Upper Eocene, and some of the species attained the size of a rhinoceros.

4. *Rhinoceros Group.*—The last section of the Perissodactyla is that of the Rhinocerotoidea, represented by the modern rhinoceroses and their extinct allies. In this group the incisors and canines are very variable in number and form; the lower canine being separated by only a short gap from the outer incisor (when present), but by a long one from the first premolar, which is in contact with the second. The second and third premolars, which are always present, are large and molar-like; the whole of these teeth being essentially of the lophodont type of *Lophiodon*, but the last upper molars assume a more or less triangular form, with an oblique outer wall, and there are certain complications in the structure of all these teeth in the more specialized types (fig. 2). The lower cheek-teeth have, unlike those of the Tapiroidea, crescentic ridges, which have not the loops at their extremities characteristic of the advanced Hippoidea; the last lower molar has no third lobe. The facial portion of the skull is generally shorter than the cranial; the orbit is freely open behind; and the premaxillae tend to be reduced and fused with the nasals. Front toes, 3 or 4; hind toes, 3.

The most primitive group is that of the American *Hyracodontidae*, represented in the Oligocene by *Hyrachyus*, *Hyracodon* and *Triplopus*. With the exception of the first lower premolar, the dentition is complete; the incisors being normal, but the canine rudimentary, and the last upper molar distinctly triangular. The upper molars have a crista and a crochet (fig. 2). The skull is high, with the facial and cranial portions approximately equal. There are only three front toes, and the limbs are long and adapted for running.

In the *Amynodontidae*, represented by the North American Middle Eocene *Amynodon* and *Metamynodon*, the premolars may be either $\frac{4}{4}$ or $\frac{3}{3}$, making the total number of teeth either 44 or 40. The incisors tend to become lateral, the canines are enlarged, and the last upper molar is sub-quadrangular. The upper molars have a crista but no crochet (fig. 2). As in the last family, the post-glenoid process of the skull is broad; the whole skull being depressed with a shortened facial portion. The fore-foot is five-toed and spreading; indicating that the members of the family were swamp-dwelling animals.

Finally, we have the family *Rhinocerotidae*, which includes the existing representatives of the group. In this family the dentition has undergone considerable reduction, and may be represented, inclusive of all the variations, by the formula *i* $\frac{2 \text{ or } 0}{1 \text{ or } 0}$, *c* $\frac{0 \text{ or } 1}{1 \text{ or } 0}$, *p* $\frac{4 \text{ or } 3}{4,\ 3 \text{ or } 2}$, *m* $\frac{3}{3}$. The first upper incisor, when present, has an antero-posteriorly elongated crown, but the second is small; when fully developed, the lower canine is a large forwardly directed tusk-like tooth with sharp cutting-edges, and biting against the first upper incisor. The third upper molar is triangular, and most of the teeth of the upper cheek-series may have both crochet and crista (fig. 2). The post-glenoid process is small, and the facial and cranial portions of the skull are approximately of equal length. Usually there are three, but occasionally four front toes; and the limb-bones are short.

A large number of representatives of the group are known from both the Old and the New World; specialization displaying itself in the later ones in the development of dermal horns over the nasal bones, either in laterally placed pairs as in some of the early forms, or in the median line, either single or double. In North America rhinoceroses became extinct before the close of the Pliocene period; but in the Old World, although their geographical distribution has become greatly restricted, at least five well-marked species survive. The group is unknown in South America.

As regards the dentition of the existing species, the cheek-series consists of the four premolars and three molars above and below, all in contact and closely resembling each other, except the first, which is much smaller than the rest and often deciduous; the

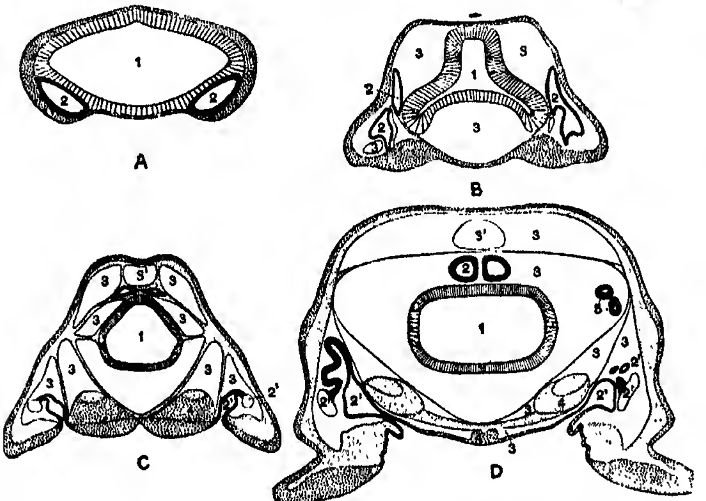
others gradually increasing in size up to the penultimate. The upper molars present a characteristic pattern of crown, having a much-developed flat or more or less sinuous outer wall, and two transverse ridges running obliquely inwards and backwards from it, terminating internally in conical eminences or columns, and enclosing a deep valley between. The posterior valley is formed behind the posterior transverse ridge, and is bounded externally by a backward continuation of the outer wall and behind by the cingulum. The anterior valley is formed in the same manner, but is much smaller. The middle valley is often intersected by vertical "crista" and "crochet" plates projecting into it from the anterior surface of the posterior transverse ridge or from the wall, the development of which is a useful guide in discriminating species, especially those known only by teeth and bones. The depressions between the ridges are not filled up with cement. As stated above, the lower molars have the crown formed by a pair of crescents; the last having no third lobe.

The head is large, and the skull elongated, and elevated posteriorly into a transverse occipital crest. No post-orbital processes or any separation between orbits and temporal fossae. Nasal bones large and stout, co-ossified, and standing out freely above the premaxillae, from which they are separated by a deep and wide fissure; the latter small, generally not meeting in the middle line in front, often rudimentary. Tympanics small, not forming a bulla. Brain-cavity small for the size of the skull. Vertebrae: cervical, 7; dorsal, 19–20; lumbar, 3; sacral, 4; caudal, about 22.

and becomes entirely transformed into a nephridium (fig. 12, D, 2'). The dorsal part shifts dorsalwards and diminishes relatively in size (fig. 12, C). Its fate differs in the different parts of the body. In the anterior somites it dwindles and disappears, but in the posterior part it unites with the dorsal divisions of contiguous somites of the same side, and forms a tube—the generative tube (fig. 12, D, 2). The last section of this tube retains its connexion with the ventral portion of the somite, and so acquires an external opening, which is at first lateral, but soon shifts to the middle line, and fuses with its fellow, to form the single generative opening. The praeoral somite develops the rudiment of a nephridium, but eventually entirely disappears. The jaw somite also disappears; the oral papilla somite forms ventrally the salivary glands, which are thus serially homologous with nephridia. The various divisions of the perivisceral cavity develop as a series of



(After Sedgwick.)

FIG. 12.—A series of diagrams of tranverse sections through *Peripatus* embryos to show the relations of the coelom at successive stages.

A, Early stage; no trace of the vascular space; endoderm and ectoderm in contact.

B, Endoderm has separated from the dorsal and ventral ectoderm. The somite is represented as having divided on the left side into a dorsal and ventral portion.

C, The haemocoele (3) has become divided up into a number of spaces, the arrangement of which is unimportant. The dorsal part of the somite has travelled dorsalwards, and now constitutes a small space (triangular in section) just dorsal to the gut. The ventral portion (2) has assumed a tubular character, and has acquired an external opening. The internal vesicle is already indicated, and is shown in the diagram by the thinner black line: 1, gut; 2, somite; 2', nephridial part of coelom; 3, haemocoele; 3', part of haemocoele which will form the heart—the part of the haemocoele on each side of this will form the pericardium; 4, nerve-cord; 5, slime glands.

D represents the conditions at the time of birth. The coelom is represented as surrounded by a thick black line, except in the part which forms the internal vesicle of the nephridium.

spaces between the ectoderm and endoderm, and later in the mesoderm. The mesoderm seems to be formed entirely from the proliferation of the cells of the mesoblastic somites. It thus appears that in *Peripatus* the coelom does not develop a perivisceral portion, but gives rise only to the renal and reproductive organs.

The genus *Peripatus* was established in 1826 by L. Guilding, who first obtained specimens of it from St Vincent in the Antilles. He regarded it as a mollusc, being no doubt deceived by the slug-like appearance given by the antennae. Specimens were subsequently obtained from other parts of the neotropical region, and from South Africa and Australia, and the animal was variously assigned by the zoologists of the day to the Annelida and Myriapoda. Its true place in the system, as a primitive member of the group Arthropoda, was first established in 1874 by H. N. Moseley, who discovered the tracheae. *Peripatus* is an Arthropod, as shown by (1) the presence of appendages modified as jaws; (2) the presence of paired lateral ostia perforating the wall of heart and putting its cavity in communication with the pericardium; (3) the presence of a vascular body cavity and pericardium (haemocoelic body cavity); (4) absence of a perivisceral section of the coelom. Finally, the tracheae, though not characteristic of all the classes of the Arthropoda, are found nowhere outside that group, and constitute a very important additional reason for uniting *Peripatus* with it. *Peripatus*, though indubitably an Arthropod, differs in such important respects from all the old-established Arthropod classes, that a special class, equivalent in rank to the others, and called Prototracheata or Onychophora, has had, as we have seen, to be created for its sole occupancy. This unlikeness to other Arthropoda is mainly due to the Annelidan affinities which it presents, but in part to the presence of the following peculiar features: (1) the number and diffusion of the tracheal apertures; (2) the restriction of the jaws to a single pair; (3) the disposition of the generative organs; (4) the texture of the skin; and (5) the simplicity and similarity of all the segments of the body behind the head. The Annelidan affinities are superficially indicated in so marked a manner by the thinness of the cuticle, the dermo-muscular body-wall, the hollow appendages, that, as already stated, many of the earlier zoologists who examined *Peripatus* placed it among the segmented worms; and the discovery that there is some solid morphological basis for this determination constitutes one of the most interesting points of the recent work on the genus. The Annelidan features are: (1) the paired nephridia in every segment of the body behind the first two (Saenger, Balfour); (2) the presence of cilia in the generative tracts (Gaffron). It is true that neither of these features is absolutely distinctive of the Annelida, but when taken in conjunction with the Annelidan disposition of the chief systems of organs, viz. the central nervous system, and the main vascular trunk or heart, they may be considered as indicating affinities in that direction.

SYNOPSIS OF SPECIES

PERIPATUS (Guilding).—Soft-bodied vermiform animals, with one pair of ringed antennae, one pair of jaws, one pair of oral papillae, and a varying number of claw-bearing ambulatory legs. Dorsal surface arched and more darkly pigmented than the flat ventral surface. Skin transversely ridged and beset by wart-like spiniferous papillae. Mouth anterior, ventral; anus posterior, terminal. Generative opening single, median, ventral and posterior. One pair of simple eyes. Brain large, with two ventral hollow appendages; ventral cords widely divaricated, without distinct ganglia. Alimentary canal simple, uncoiled. Segmentally arranged paired nephridia are present. Body cavity is continuous with the vascular system, and does not communicate with the paired nephridia. Heart tubular, with paired ostia. Respiration by means of tracheae. Dioecious; males smaller and generally less numerous than females. Generative glands tubular, continuous with the ducts. Viviparous. Young born fully developed. Distribution: Africa (Cape Colony, Natal, and the Gaboon), New Zealand, Australia and Tasmania, New Britain, South and Central America and the West Indies, the Malay Peninsula [and in Sumatra ?].

The genus *Peripatus*, so far as adult conformation is concerned, is a very homogeneous one. It is true, as was pointed out by Sedgwick, that the species from the same part of the world resemble one another more closely than they do species from other regions, but recent researches have shown that the line between them cannot be so sharply drawn as was at first supposed, and it is certainly not desirable in the present state of our knowledge to divide them into generic or subgeneric groups, as has been done by some zoologists. (The following genera have been proposed: *Peripatus* for the neotropical species, *Peripatoides* for the Australasian, *Peripatopsis* and *Opisthopatus* for the African, *Paraperipatus* for the New Britain, *Eoperipatus* for the Malayan species, and *Ooperipatus* for the supposed oviparous species of Australia and New Zealand.) The colour is highly variable in species from all regions; it is perhaps more constant in the species from the neotropical region than in those from elsewhere. The number of legs tends to be variable whenever it exceeds 19 praegenital pairs; when the number is less than that it is usually, though not always, constant. More constant points of difference are the form of the jaws, the position of the generative orifice, the presence of a receptaculum seminis and a receptaculum ovorum, the arrangement of the primary papillae on the distal end of the feet, and above all the early development.

South African Species.—With three spinous pads on the legs,

There may be no abdominal distension, and no pain or tenderness. The patient may lie quietly in bed, flat on his back, with the legs down straight, and he may have no marked elevation of temperature. There may be no vomiting and no constipation or diarrhoea. In some cases, the neighbouring coils of intestine having been glued together, a collection of serous fluid takes its place in the midst of the mass, and, being walled in by the adhesions, forms a rounded tumour, dull on percussion, but not tender or painful. Such cases, especially when occurring in women are apt to be mistaken for cystic disease of the ovary.

As regards the *treatment of acute peritonitis*, the first thing that the surgeon has to do is to assure himself that the disease is not due to some cause which itself should be dealt with, to a septic disease of appendix or Fallopian tube, for instance, or to a toxic condition of the uterus, the result, perhaps, of a criminal or innocent abortion, or to a perforated ulcer of stomach or intestine. In many obscure cases the safest treatment is likely to be afforded by an exploratory abdominal section. If the medical attendant has made up his mind that the qoestion of exploration is not to be entertained—a decision which should be arrived at only after most deliberate consultation—the best thing will be to apply fomentations to the abdomen, and to administer small and repeated doses of morphia by the skin—⅙ or ¼ grain—repeated every hour or so until the physiological effect is produced. As regards other drugs, it may be a question as to whether calomel or Epsom salts should be given. As regards food, the only thing that can be safely recommended is a little hot water taken in sips. A bed-cradle should be placed over the patient in order to keep the weight of the bed-clothes from the abdomen. (E. O.*)

PERIZONIUS (or Accinctus), the name of Jakob Voorbroek (1651–1715), Dutch classical scholar, who was born at Appingedam in Groningen on the 26th of October 1651. He was the son of Anton Perizonius (1626–1672), the author of a once well-known treatise, *De ratione studii theologici*. Having studied at the university of Utrecht, he was appointed in 1682 to the chair of eloquence and history at Franeker through the influence of J. G. Graevius and Nicolas Heinsius. In 1693 he was promoted to the corresponding chair at Leiden, where he died on the 6th of April 1715. The numerous works of Perizonius entitle him to a very high place among the scholars of his age. Special interest attaches to his edition of the *Minerva* of Francisco Sanchez or Sanctius of Salamanca (1st ed., 1587; ed. C. L. Bauer, 1793–1801), one of the last developments of the study of Latin grammar in its pre-scientific stage, when the phenomena of language were still regarded as for the most part disconnected, conventional or fortuitous. Mention should also be made of his *Animadversiones historicae* (1685), which may be said to have laid the foundations of historical criticism, and of his treatises on the Roman republic, alluded to by Niebuhr as marking the beginning of that new era of historical study with which his own name is so closely associated.

The article on Perizonius in Van der Aa's *Biographisch Woordenboek der Nederlanden* contains full biographical and bibliographical particulars; see also F. A. Eckstein in Ersch and Gruber's *Allgemeine Encyklopädie*.

PERJURY (through the Anglo-Fr. *perjurie*, modern *parjure*, Lat. *perjurium*, a false oath, *perjurare*, to swear falsely), an assertion upon an oath duly administered in a judicial proceeding, before a competent court of the truth of some matter of fact, material to the question depending in that proceeding, which assertion the assertor does not believe to be true when he makes it, or on which he knows himself to be ignorant (Stephen, *Digest of the Criminal Law*, art. 135). In the early stages of legal history perjury seems to have been regarded rather as a sin than as a crime, and so subject only to supernatural penalties. The injury caused by a false oath was supposed to be done not so much to society as to the Divine Being in whose name the oath was taken (see Oath). In Roman law, even in the time of the empire, the perjurer fell simply under divine reprobation, and was not dealt with as a criminal, except where he had been bribed to withhold true or give false evidence, or where the oath was by the genius of the emperor. In the latter case punishment was no doubt inflicted more for the insult to the emperor than for the perjury. False testimony leading to the conviction of a person for a crime punishable with death constituted the offence of homicide rather than of perjury. In England, perjury, as being a sin, was originally a matter of ecclesiastical cognisance. At a later period, when it had become a crime, the jurisdiction of the spiritual courts became gradually confined to such perjury as was committed in ecclesiastical proceedings, and did not extend to perjury committed in a temporal court. The only perjury which was for a long time noticed at common law was the perjury of jurors. Attaint of jurors (see Attaint, Writ of), who were originally rather in the position of witnesses than of judges of fact, incidentally subjected them to punishment for perjury. Criminal jurisdiction over perjury by persons other than jurors seems to have been first assumed by the Star Chamber, acting under the powers supposed to have been conferred by an act of Henry VII. (1487). After the abolition of the Star Chamber by the Long Parliament in 1641 and the gradual diminution of the authority of the spiritual courts, perjury (whether in the strict sense of the word or the taking of a false oath in non-judicial proceedings) practically fell entirely within the jurisdiction of the ordinary criminal tribunals. At common law only a false oath in judicial proceedings is perjury. But by statute the penalties of perjury have been extended to extra-judicial matters, *e.g.* false declarations made for the purpose of procuring marriage (The Marriage and Registration Act 1856), and false affidavits under the Bills of Sale Act 1878. False affirmation by a person permitted by law to affirm is perjury (The Evidence Further Amendment Act 1869; The Evidence Amendment Act 1870).

In order to support an indictment for perjury the prosecution must prove the authority to administer the oath, the occasion of administering it, the taking of the oath, the substance of the oath, the materiality of the matter sworn, the falsity of the matter sworn, and the corrupt intention of the defendant. The indictment must allege that the perjury was wilful and corrupt, and must set out the false statement or statements on which perjury is assigned, subject to the provisions of the Prosecutions for Perjury Act 1749 (which also applies to subornation of perjury). By that act it is sufficient to set out the substance of the offence, without setting forth the bill, answer, &c., or any part of the record and without setting forth the commission or authority of the court before whom the perjury was committed. The matter sworn to must be one of fact and not of mere belief or opinion. It is not homicide, as in Roman law, to procure the death of another by false evidence, but the Criminal Code, ss. 118, 164, proposed to make such an offence a substantive crime of greater gravity than ordinary perjury, and punishable by penal servitude for life. It is a rule of evidence, founded upon obvious reasons, that the testimony of a single witness is insufficient to convict on a charge of perjury. There must be corroboration of his evidence in some material particular. Perjury is a common law misdemeanour, not triable at quarter-sessions. Most persons in a judicial position have the right of directing the prosecution of any witness, if it appears to them that he has been guilty of perjury (The Criminal Procedure Act 1851). The provisions of the Vexatious Indictments Act 1859 extend to perjury and subornation of perjury. By that Act no indictment for either of such offences can be preferred unless the prosecutor or accused is bound by recognisance, or the accused is in custody, or the consent of a judge is obtained, or (in the case of perjury) a prosecution is directed under the act of 1851.

Subornation of perjury is procuring a person to commit a perjury which he actually commits in consequence of such procurement. If the person attempted to be suborned do not take the oath, the person inciting him, though not guilty of subornation, is liable to fine and corporal punishment. Perjury and subornation of perjury are punishable at common law with fine and imprisonment. By the combined operation of the Perjury Act 1728 and later statutes, the punishment at present appears to be penal servitude for any term, or imprisonment with or without hard labour for a term not exceeding seven years (see Stephen, *Digest*, art. 148). The punishment at common law was whipping, imprisonment, fine and pillory.

and becomes entirely transformed into a nephridium (fig. 12, D, 2′). The dorsal part shifts dorsalwards and diminishes relatively in size (fig. 12, C). Its fate differs in the different parts of the body. In the anterior somites it dwindles and disappears, but in the posterior part it unites with the dorsal divisions of contiguous somites of the same side, and forms a tube—the generative tube (fig. 12, D, 2). The last section of this tube retains its connexion with the ventral portion of the somite, and so acquires an external opening, which is at first lateral, but soon shifts to the middle line, and fuses with its fellow, to form the single generative opening. The praeoral somite develops the rudiment of a nephridium, but eventually entirely disappears. The jaw somite also disappears; the oral papilla somite forms ventrally the salivary glands, which are thus serially homologous with nephridia. The various divisions of the perivisceral cavity develop as a series of

Synopsis of Species

Peripatus (Guilding).—Soft-bodied vermiform animals, with one pair of ringed antennae, one pair of jaws, one pair of oral papillae, and a varying number of claw-bearing ambulatory legs. Dorsal surface arched and more darkly pigmented than the flat ventral surface. Skin transversely ridged and beset by wart-like spiniferous papillae. Mouth anterior, ventral; anus posterior, terminal. Generative opening single, median, ventral and posterior. One pair of simple eyes. Brain large, with two ventral hollow appendages; ventral cords widely divaricated, without distinct ganglia. Alimentary canal simple, uncoiled. Segmentally arranged paired nephridia are present. Body cavity is continuous with the vascular system, and does not communicate with the paired nephridia. Heart tubular, with paired ostia. Respiration by means of tracheae. Dioecious; males smaller and generally less numerous than females. Generative glands tubular, continuous with the ducts. Viviparous. Young born fully developed. Distribution: Africa (Cape Colony, Natal, and the Gaboon), New Zealand, Australia and Tasmania, New Britain, South and Central America and the West Indies, the Malay Peninsula [and in Sumatra ?].

The genus *Peripatus*, so far as adult conformation is concerned, is a very homogeneous one. It is true, as was pointed out by Sedgwick, that the species from the same part of the world resemble one another more closely than they do species from other regions, but recent researches have shown that the line between them cannot be so sharply drawn as was at first supposed, and it is certainly not desirable in the present state of our knowledge to divide them into generic or subgeneric groups, as has been done by some zoologists. (The following genera have been proposed: *Peripatus* for the neotropical species, *Peripatoides* for the Australasian, *Peripatopsis* and *Opisthopatus* for the African, *Paraperipatus* for the New Britain, *Eoperipatus* for the Malayan species, and *Ooperipatus* for the supposed oviparous species of Australia and New Zealand.) The colour is highly variable in species from all regions; it is perhaps more constant in the species from the neotropical region than in those from elsewhere. The number of legs tends to be variable whenever it exceeds 19 praegenital pairs; when the number is less than that it is usually, though not always, constant. More constant points of difference are the form of the jaws, the position of the generative orifice, the presence of a receptaculum seminis and a receptaculum ovorum, the arrangement of the primary papillae on the distal end of the feet, and above all the early development.

South African Species.—With three spinous pads on the legs,

PERLES, JOSEPH (1835–1894), Jewish rabbi, was born in Hungary in 1835, and died at Munich in 1894. He was one of the first rabbis trained at the new type of seminary (Breslau). Perles' most important essays were on folk-lore and custom. There is much that is striking and original in his history of marriage (*Die jüdische Hochzeit in nachbiblischer Zeit*, 1860), and of mourning customs (*Die Leichenfeierlichkeiten im nachbiblischen Judenthum*, 1861), his contributions to the sources of the Arabian Nights (*Zur rabbinischen Sprach- und Sagenkunde*, 1873), and his notes on rabbinic antiquities (*Beiträge zur rabbinischen Sprach- und Altertumskunde*, 1893). Perles' essays are rich in suggestiveness, and have been the starting-point of much fruitful research. He also wrote an essay on Nachmanides, and a biography and critical appreciation of Rashba (1863). (I. A.)

PERLITE, or PEARLSTONE, a glassy volcanic rock which, when struck with a hammer, breaks up into small rounded masses that often have a pearly lustre. The reason for this peculiarity is obvious in microscopic sections of the rock, for many small cracks may be seen traversing the glassy substance. These mostly take a circular course, and often occur in groups, one within another. The circular cracks bound the little spheres into which the rock falls when it is struck, and the concentric fissures are the cause of the pearly lustre, by the reflection of light from enclosed films of air. Longer straight cracks run across the sections separating areas in which the circular fissures preponderate. By decomposition the fissures may be occupied by deposits of limonite, which make them more obvious, or by other secondary minerals. The glass itself often undergoes change along the cracks by becoming finely crystalline or devitrified, dull in appearance and slightly opaque in section. In polarized light the perlitic glass is usually quite isotropic, but sometimes the internal part of some of the spheres has a slight double refraction which is apparently due to strain. The glass found on the waste-heaps of glass-furnaces is sometimes very coarsely perlitic.

Perlitic structure is not confined to glass, but may be seen also in that variety of opal which is called hyalite. This forms small transparent rounded masses like drops of gum, and in microscopic section exhibits concentric systems of cracks. Hyalite, like perlitic obsidian, is amorphous or non-crystalline. It is easy to imitate perlitic structure by taking a little Canada balsam and heating it on a slip of glass till most of the volatile matters are driven out; then drop it in a basin of cold water and typical perlitic structure will be produced. The reason is apparently the sudden contraction when the mass is chilled. In the glaze on tiles and china rounded or polygonal systems of cracks may often be seen which somewhat resemble perlitic structure but are less perfect and regular. Many rocks which are cryptocrystalline or felsitic, and not glassy, have perfect perlitic structure, and it seems probable that these were originally vitreous obsidians or pitchstones and have in process of time been changed to a finely crystalline state by devitrification. Occasionally in olivine and quartz rounded cracks not unlike perlitic structure may be observed.

Many perlitic rocks contain well-developed crystals of quartz, feldspar, augite or magnetite, &c., usually more or less corroded or rounded, and in the fine glassy base minute crystallites often abound. Some of the rocks have the resinous lustre and the high percentages of combined water which distinguish the pitchstones; others are bright and fresh obsidians, and nearly all the older examples are dull, cryptocrystalline felsites. According to their chemical compositions they range from very acid rhyolites to trachytes and andesites, and the dark basaltic glasses or tachylytes are sometimes highly perlitic. It is probable that most perlites are of intrusive origin, and the general absence of steam cavities in these rocks would support this conclusion, but some perlitic Hungarian rhyolites are believed to be lavas.

Very well known rocks of this kind are found in Meissen, Saxony, as dikes of greenish and brownish pitchstone. Other examples are furnished by the Tertiary igneous rocks of Hungary (Tokai, &c.), the Euganean Hills (Italy) and Ponza Island (in the Mediterranean). In mineralogical collections rounded nodules of brown glass varying from the size of a pea to that of an orange may often be seen labelled *Marekanite*. They have long been known to geologists and are found at Ockotsk, Siberia, in association with a large mass of perlitic obsidian. These globular bodies are, in fact, the more coherent portions of a perlite; the rest of the rock falls down in a fine powder, setting free the glassy spheres. They are subject to considerable internal strain, as is shown by the fact that when struck with a hammer or sliced with a lapidary's saw they often burst into fragments. Their behaviour in this respect closely resembles the balls of rapidly cooled, unannealed glass which are called Prince Rupert's drops. In their natural condition the marekanite spheres are doubly refracting, but when they have been heated and very slowly cooled they lose this property and no longer exhibit any tendency to sudden disintegration.

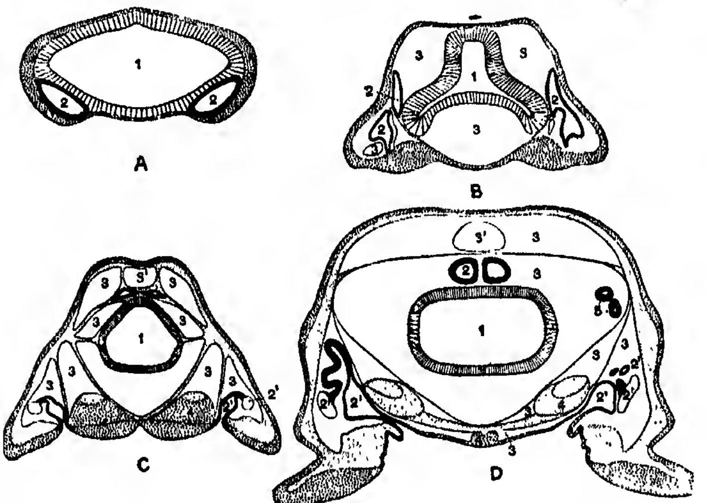
In Great Britain Tertiary vitreous rocks are not common, but the pitchstone which forms the Scuir of Eigg is a dark andesitic porphyry with perlitic structure in its glassy matrix. A better example, however, is provided by a perlitic dacitic pitchstone porphyry that occurs near the Tay Bridge in Fifeshire. The tachylytic basalt dikes of Mull are occasionally highly perlitic. At Sandy Braes in Antrim a perlitic obsidian has been found, and the Lea Rock, near Wellington in Shropshire, is a devitrified obsidian which shows perlitic cracks and the remains of spherulites. (J. S. F.)

PERM, a government of east Russia, bounded S. by the governments of Orenburg and Ufa, W. by Vyatka, N.W. by Vologda, and E. by Tobolsk (Siberia). It has an area of 128,173 sq. m. Though administratively it belongs entirely to Russia in Europe, its eastern part (about 57,000 sq. m.) is situated in Siberia, in the basin of the Ob. The government is traversed from north to south by the Ural Mountains, 30 to 45 m. in width, thickly clothed with forests, and deeply excavated by rivers. The highest summits do not rise above 3600 ft. in the northern section of the range (the Vogulian Ural); in the central portion, between 59° and 60° 30′ N., they once or twice exceed 5000 ft. (Denezhkin, 5360 ft.); but the chain soon sinks towards the south, where it barely attains an elevation of 3000 ft. Where the great Siberian road crosses it the highest point is 1400 ft.

The government is very well drained by rivers belonging to the Pechora, Tobol (affluent of the Ob) and Kama systems. The Pechora itself rises in the northern corner of the government, and its tributary the Volosnitsa is separated by a distance of less than 3 m. from the navigable Vogulka, a tributary of the Kama, a circumstance of some commercial importance. The chief river of Perm, is however, the Kama, whose navigable tributaries the Chusovaya, Sylva and Kolva are important channels for the export of heavy iron goods to Russia. The government is dotted with a great number of lakes of comparatively trifling size, their total area being 730 sq. m., and with marshes, which are extensive in the hilly tracts of the north. Granites, diorites, porphyries, serpentines and Laurentian gneisses and limestones, containing iron, copper and zinc ores, constitute the main axis of the Ural chain; their western slope is covered by a narrow strip of Huronian crystalline slates, which disappear in the east under the Post-Tertiary deposits of the Siberian lowlands, while on the west narrow strips of Silurian limestones, quartzites and slates, and separate islands of Devonian deposits, appear on the surface. These in their turn are overlain with Carboniferous clays and sandstones, containing Coal Measures in several isolated basins. The Permian deposits extend as a regular strip, parallel to the main ridge, over these last, and are covered with the so-called "variegated marls," which are considered as Triassic, and appear only in the western corner of the territory.

Perm is the chief mining region of Russia, owing to its wealth in iron, silver, platinum, copper, nickel, lead, chrome ore, manganese and auriferous alluvial deposits. Many rare metals, such as iridium, osmium, rhodium and ruthenium, are found along with the above, as also a great variety of precious stones, such as diamonds, sapphires, jaspers, tourmalines, beryls, phenacites, chrysoberyls, emeralds, aquamarines, topazes, amethysts, jades, malachite. Salt-springs occur in the west; and the mineral waters, though still little known, are worthy of mention. No less than 70 % of the total area is occupied with forest; but the forests are distributed very unequally, covering 95 % of the area in the north and only 25 % in the south-east. Firs, the pine, cedar, larch, birch, alder and lime are the most common; the oak appears only in the south-west. The flora of

and becomes entirely transformed into a nephridium (fig. 12, D, 2'). The dorsal part shifts dorsalwards and diminishes relatively in size (fig. 12, C). Its fate differs in the different parts of the body. In the anterior somites it dwindles and disappears, but in the posterior part it unites with the dorsal divisions of contiguous somites of the same side, and forms a tube—the generative tube (fig. 12, D, 2). The last section of this tube retains its connexion with the ventral portion of the somite, and so acquires an external opening, which is at first lateral, but soon shifts to the middle line, and fuses with its fellow, to form the single generative opening. The praeoral somite develops the rudiment of a nephridium, but eventually entirely disappears. The jaw somite also disappears; the oral papilla somite forms ventrally the salivary glands, which are thus serially homologous with nephridia. The various divisions of the perivisceral cavity develop as a series of



(After Sedgwick.)

FIG. 12.—A series of diagrams of tranverse sections through *Peripatus* embryos to show the relations of the coelom at successive stages.

A, Early stage; no trace of the vascular space; endoderm and ectoderm in contact.

B, Endoderm has separated from the dorsal and ventral ectoderm. The somite is represented as having divided on the left side into a dorsal and ventral portion.

C, The haemocoele (3) has become divided up into a number of spaces, the arrangement of which is unimportant. The dorsal part of the somite has travelled dorsalwards, and now constitutes a small space (triangular in section) just dorsal to the gut. The ventral portion (2) has assumed a tubular character, and has acquired an external opening. The internal vesicle is already indicated, and is shown in the diagram by the thinner black line: 1, gut; 2, somite; 2', nephridial part of coelom; 3, haemocoele; 3', part of haemocoele which will form the heart—the part of the haemocoele on each side of this will form the pericardium; 4, nerve-cord; 5, slime glands.

D represents the conditions at the time of birth. The coelom is represented as surrounded by a thick black line, except in the part which forms the internal vesicle of the nephridium.

spaces between the ectoderm and endoderm, and later in the mesoderm. The mesoderm seems to be formed entirely from the proliferation of the cells of the mesoblastic somites. It thus appears that in *Peripatus* the coelom does not develop a perivisceral portion, but gives rise only to the renal and reproductive organs.

The genus *Peripatus* was established in 1826 by L. Guilding, who first obtained specimens of it from St Vincent in the Antilles. He regarded it as a mollusc, being no doubt deceived by the slug-like appearance given by the antennae. Specimens were subsequently obtained from other parts of the neotropical region, and from South Africa and Australia, and the animal was variously assigned by the zoologists of the day to the Annelida and Myriapoda. Its true place in the system, as a primitive member of the group Arthropoda, was first established in 1874 by H. N. Moseley, who discovered the tracheae. *Peripatus* is an Arthropod, as shown by (1) the presence of appendages modified as jaws; (2) the presence of paired lateral ostia perforating the wall of heart and putting its cavity in communication with the pericardium; (3) the presence of a vascular body cavity and pericardium (haemocoelic body cavity); (4) absence of a perivisceral section of the coelom. Finally, the tracheae, though not characteristic of all the classes of the Arthropoda, are found nowhere outside that group, and constitute a very important additional reason for uniting *Peripatus* with it. *Peripatus*, though indubitably an Arthropod, differs in such important respects from all the old-established Arthropod classes, that a special class, equivalent in rank to the others, and called Prototracheata or Onychophora, has had, as we have seen, to be created for its sole occupancy. This unlikeness to other Arthropoda is mainly due to the Annelidan affinities which it presents, but in part to the presence of the following peculiar features: (1) the number and diffusion of the tracheal apertures; (2) the restriction of the jaws to a single pair; (3) the disposition of the generative organs; (4) the texture of the skin; and (5) the simplicity and similarity of all the segments of the body behind the head. The Annelidan affinities are superficially indicated in so marked a manner by the thinness of the cuticle, the dermo-muscular body-wall, the hollow appendages, that, as already stated, many of the earlier zoologists who examined *Peripatus* placed it among the segmented worms; and the discovery that there is some solid morphological basis for this determination constitutes one of the most interesting points of the recent work on the genus. The Annelidan features are: (1) the paired nephridia in every segment of the body behind the first two (Saenger, Balfour); (2) the presence of cilia in the generative tracts (Gaffron). It is true that neither of these features is absolutely distinctive of the Annelida, but when taken in conjunction with the Annelidan disposition of the chief systems of organs, viz. the central nervous system, and the main vascular trunk or heart, they may be considered as indicating affinities in that direction.

Synopsis of Species

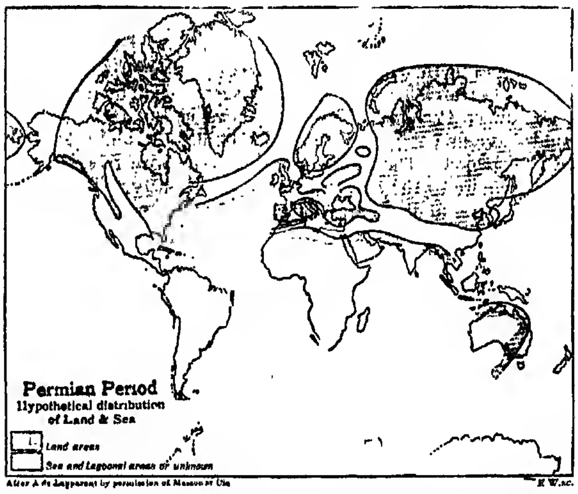
PERIPATUS (Guilding).—Soft-bodied vermiform animals, with one pair of ringed antennae, one pair of jaws, one pair of oral papillae, and a varying number of claw-bearing ambulatory legs. Dorsal surface arched and more darkly pigmented than the flat ventral surface. Skin transversely ridged and beset by wart-like spiniferous papillae. Mouth anterior, ventral; anus posterior, terminal. Generative opening single, median, ventral and posterior. One pair of simple eyes. Brain large, with two ventral hollow appendages; ventral cords widely divaricated, without distinct ganglia. Alimentary canal simple, uncoiled. Segmentally arranged paired nephridia are present. Body cavity is continuous with the vascular system, and does not communicate with the paired nephridia. Heart tubular, with paired ostia. Respiration by means of tracheae. Dioecious; males smaller and generally less numerous than females. Generative glands tubular, continuous with the ducts. Viviparous. Young born fully developed. Distribution: Africa (Cape Colony, Natal, and the Gaboon), New Zealand, Australia and Tasmania, New Britain, South and Central America and the West Indies, the Malay Peninsula [and in Sumatra ?].

The genus *Peripatus*, so far as adult conformation is concerned, is a very homogeneous one. It is true, as was pointed out by Sedgwick, that the species from the same part of the world resemble one another more closely than they do species from other regions, but recent researches have shown that the line between them cannot be so sharply drawn as was at first supposed, and it is certainly not desirable in the present state of our knowledge to divide them into generic or subgeneric groups, as has been done by some zoologists. (The following genera have been proposed: *Peripatus* for the neotropical species, *Peripatoides* for the Australasian, *Peripatopsis* and *Opisthopatus* for the African, *Paraperipatus* for the New Britain, *Eoperipatus* for the Malayan species, and *Ooperipatus* for the supposed oviparous species of Australia and New Zealand.) The colour is highly variable in species from all regions; it is perhaps more constant in the species from the neotropical region than in those from elsewhere. The number of legs tends to be variable whenever it exceeds 19 praegenital pairs; when the number is less than that it is usually, though not always, constant. More constant points of difference are the form of the jaws, the position of the generative orifice, the presence of a receptaculum seminis and a receptaculum ovorum, the arrangement of the primary papillae on the distal end of the feet, and above all the early development.

South African Species.—With three spinous pads on the legs,

PERMEAMETER, an instrument for rapidly measuring the permeability of a sample of iron or steel with sufficient accuracy for many commercial purposes. The name was first applied by S. P. Thompson to an apparatus devised by himself in 1890, which indicates the mechanical force required to detach one end of the sample, arranged as the core of a straight electromagnet, from an iron yoke of special form; when this force is known, the permeability can be easily calculated. (See MAGNETISM.)

PERMIAN, in geology, the youngest and uppermost system of strata of the Palaeozoic series, situated above the Carboniferous and below the Trias. The term "Permian" (derived from the



Russian province of Perm, where the rocks are extensively developed) was introduced in 1841 by Sir R. I. Murchison. In England the series of red sandstones, conglomerates, breccias and marls which overlie the Coal Measures were at one time grouped together in one great formation as the "New Red Sandstone," in contradistinction to the Old Red Sandstone below the Carboniferous: they were likewise known as the *Poikilitic series* (from Gr. ποικίλος, mottled) from their mottled or variegated colour. They are now divided into two systems or groups of formations; the lower portion being included in the Palaeozoic series under the name Permian, the upper portion being relegated to the Mesozoic series and termed Trias. In Germany the name *Dyas* was proposed by J. Marcou for the rocks of this age on account of the twofold nature of the series in Thuringia, Saxony, &c. The intimate stratigraphical relationship that exists in many quarters between the Permian rocks and the Carboniferous beds, and the practical difficulties in the way of drawing a satisfactory base-line to the system, have led to the adoption of the term *Permo-carboniferous* in South Africa, southern Asia, America, Australia and Russia, for strata upon this horizon: C. W. von Gümbel used "Post-carbon" in this sense. In a similar manner *Permo-triassic* has been employed in cases where a stratigraphical passage from rocks with Permian fossils to others hearing a Triassic fauna is apparent.

The Permian system in England consists of the following subdivisions:—

		W. of England.	E. of England.
3. Upper...	Red sandstones, clays, and gypsum	600 ft.	50–100 ft.
2. Middle..	Magnesian limestone . . . Marl slate	10–30 „	600 „
1. Lower...	Red and variegated sandstone Reddish-brown and purple sandstones and marls, with calcareous conglomerates and breccias of volcanic rocks.	3000 „	100–250 „

From the thicknesses here given it is evident that the Permian rocks have a very different development on the two sides of England. On the east side, from the coast of Northumberland southwards to the plains of the Trent, they consist chiefly of a great central mass of limestone. But on the west side of the Pennine Chain, and extending southwards into the central counties, the calcareous zone disappears, and we have a great accumulation of red, arenaceous and gravelly rocks.

The lower subdivision attains its greatest development in the vale of the Eden, where it consists of brick-red sandstones, the Penrith sandstone series, with some beds of calcareous conglomerate or breccia, locally known as "brockram," derived from the waste of the Carboniferous Limestone. These red rocks extend across the Solway into the valleys of the Nith and Annan, in the south of Scotland, where they lie unconformably on the Lower Silurian rocks. Their breccias consist of fragments of the adjacent Silurian greywackes and shales, but near Dumfries some calcareous breccias or "brockrams" occur. These brecciated masses have evidently accumulated in small lakes or narrow fiords. Much farther south, in Staffordshire, and in the districts of the Clent and Abberley Hills, the brecciated conglomerates in the Permian series attain a thickness of 400 ft. They have been shown by Sir A. C. Ramsay to consist in large measure of volcanic rocks, grits, slates and limestones, which can be identified with rocks on the borders of Wales. Some of the stones are 3 ft. in diameter and show distinct striation. The same writer pointed out that these Permian drift-beds cannot be distinguished by any essential character from modern glacial drifts; on the other hand, W. W. King and others have opposed this view.

The middle subdivision is the chief repository of fossils in the Permian system. Its strata are not red, but consist of a lower zone of hard brown shale with occasional thin limestone bands (Marl Slate) and an upper thick mass of dolomite (Magnesian Limestone). The latter is the chief feature in the Permian development of the east of England. It corresponds with the *Zechstein* of Germany, as the Marl Slate does with the *Kupfer-schiefer*. It is a very variable rock in its lithological characters, being sometimes dull, earthy, fine-grained and fossiliferous, in other places quite crystalline, and composed of globular, reniform, botryoidal, or other irregular concretions of crystalline and frequently internally radiated dolomite. Though the Magnesian Limestone runs as a thick persistent zone down the east of England, it is represented on the Lancashire and Cheshire side by bright red and variegated sandstone covered by a thin group of red marls, with numerous thin courses of limestone, containing *Schizodus, Bakevellia* and other characteristic fossils of the Magnesian Limestone.

Concerning the rocks classed as Permian in the central counties of England there exists some doubt, for recent work tends to show that the lower parts are clearly related to the Carboniferous rocks, by their fossils; while there is little evidence to warrant the exclusion of the higher beds from the Trias. Similarly in south Devon, where red sandstones and coarse breccias are well exposed, it has been found difficult to say whether the series should be regarded as Triassic or Permian, though the prevailing tendency is to retain them in the latter system.

The "Dyas" type of the system is found in enormous masses of strata flanking the Harz Mountains, and also in the Rhine provinces, Saxony, Thuringia, Bavaria and Bohemia. In general terms it may be said that in this region there is a lower sandy and conglomeratic subdivision with an uppor one more calcareous; the former is known as the *Rothliegende*, the latter as the *Zechstein* group. On the south side of the Harz Mountains the following subdivisions are recognized:—

Zechstein Group.	Upper	Anhydrite, gypsum, rock-salt, dolomite, marl, fetid shale and limestone. The amorphous gypsum is the chief member of this group; the limestone is sometimes full of bitumen.
	Middle	Dolomite (*Haupt-dolomit*), crystalline granular (*Rauchwacke*), and fine powdery (*Asche*) with gypsum at bottom.
	Lower	Zechstein-limestone, an argillaceous, thin-bedded compact limestone 15 to 90 ft. thick. Kupfer-schiefer, a black bituminous copper-bearing shale, not more than 2 ft. thick, often much less, but very constant. Zechstein-conglomerate and calcareous sandstone.
Rothliegende Group	Upper	Red sandstones (*Kreuznach* beds), red shales (*Monsig* beds) with sheets of melaphyre tuff, and quartz-porphyry-conglomerate (*Wadern, Oberhof, Sötern* and *Tambach* beds).
	Lower	Sandstones and glomerates (*Tholayer* beds) on black shales with poor coal seams and clay ironstones (*Lebach* and *Goldlauter* beds). Sandstones and shales with seams of coal on red and grey sandstones and shales with impure limestones (*Cusel* beds, including Manebach beds, upper, and Gehren beds, lower).

The name *Rothliegende* or *Rothtodtliegende* (red-dead-layer) was given by the miners because their ores disappeared in the red rocks below the copper-bearing Kupfer-schiefer. The Kupfer-schiefer, although so thin, has been worked in the Mansfeld district for a long period; it contains abundant remains of fish (*Palaeoniscus, Platysomus*) and plants (*Ullmannia*). The beds of rock-salt in the German Zechstein are of the greatest importance; at Sperenberg near Berlin it has been penetrated to a depth of 4000 ft. Associated with the salt, gypsum and anhydrite are numerous

potassium and magnesium salts, including carnallite, kieserite and polyhalite, which are exploited at Stassfurt and are the only important potassium deposits known. Permian rocks of the Rothliegende type are scattered over a wide area in France, where the lower beds are usually conformable with the Coal Measures. In the upper beds occur the bituminous or "Boghead" shale of Autun. In Russia strata of this age cover an enormous area, in the Ural region, in the governments of Perm, Kasan, Kostroma, and in Armenia. The Russian Permian shows no sharp division into two series; the two types of deposit tend to be more mixed and include in addition some deposits of the more open sea. The general sequence begins with the *Artinsk* beds, sandy and marly or conglomeratic beds in close connexion with the Carboniferous, overlain by the *Kungur* limestones and dolomites; these are followed by red fresh-water sandstones, over which comes an important series of copper-bearing sandstones and conglomerates. Above this, in Kostroma, Vyatka and Kasan there is a calcareous and dolomitic series, the so-called "Russian Zechstein" with marine fossils; the uppermost beds are red marls, with few fresh-water fossils, the *Tartarian* beds.

The character of the fossils in the Permian of the Mediterranean and south-east Europe—well exemplified in the deposits of Sicily—together with their more generally calcareous nature, indicate a more open sea and more stable marine conditions than obtained farther north. This sea is traceable across south-east Russia into the middle of Asia, through Turkestan and Persia, into the Salt Range of India, where the Productus limestone may be taken as representative of the normal marine plan of Permian times. Southwards, however, of the Nerbudda River another and quite distinct continental assemblage of deposits holds the ground, viz. the lower portion of the great fresh-water Gondwāna system. The coarse *Talchir conglomerates* at the base are succeeded by the sandstones and shales of the *Karharbari group*, with numerous coal seams, and these in turn are followed by the *Damuda series* (upwards of 10,000 ft.) of similar rocks, with ironstones and very valuable coal seams. All these strata are characterized by the presence of the Glossopteris flora. A similar succession of beds has been recorded in north-west Afghanistan. In close relationship with the lower members of the Indian Gondwāna series, both as regards fossil contents and lithological characters, are the lower *Karoo beds* of South Africa (Dwyka conglomerate, Ecca shales and mudstones, Beaufort beds and Kimberley shales), also the coal-bearing beds of the Transvaal; the Permo-carboniferous rocks of Australia (including the rich coal measures of Newcastle, the Greta coal measures and marine beds, upper and lower, of New South Wales; those of Tasmania, the Bowen River beds of Queensland, and the Bacchus Marsh glacial beds of Victoria), and similar rocks in New Zealand (Maitai formation, south island; Dun Mountain limestone and Rimutaka beds of the north island) and South America. In North America Permian rocks occur in the east in Pennsylvania, West Virginia, Maryland and Ohio ("Upper Barren Measures"), and in Prince Edward Island, New Brunswick, where they succeed the Carboniferous rocks very regularly. West of the Mississippi, in Texas (7000 ft., including the Wichita beds, Clear Fork and Double Mountain beds), Kansas and Nebraska, the Permian is more extensive and on the whole is more readily separable from the Carboniferous. Here the lower beds are marine and contain many limestones and dolomites; the higher beds are mainly red sandstones and marls with gypsum; in Texas it is of interest to note the occurrence of copper-stained strata. These upper "Red Beds" are often not clearly distinguishable from the Trias.

Life of the Permian Period.—The records of the plants and animals of this period are comparatively meagre. The plants show that a gradual change from the Carboniferous types was in progress. Two floral regions are clearly indicated, a northern and a southern. In the latter, which may be regarded as conterminous with the continent of Gondwāna, the Lepidodendrons, Sigillarias, Calamites, &c., of the Coal Measures gave place to a distinct flora, named from the prevalence of *Glossopteris*, the Glossopteris (tongue-fern) flora. Traces of this southern flora have been found in northern Russia. *Gangamopteris*, *Callipteris*, *Taeniopteris*, *Schizopteris*, *Walchia*, *Voltzia*, *Ullmannia*, *Saportea*, *Baiera* are characteristic Permian genera. Among the larger animals amphibians occupied a prominent position, their footprints being very common in the sandstones; they include numerous Labyrinthodonts, *Archegosaurus*, *Stereorachis*, *Branchiosaurus*. At this time the true reptiles began to leave their remains in the rocks; many highly interesting forms are known—*Palaeohatteria*, *Proterosaurus*, *Stereosternum*; others having certain mammalian characteristics include *Pareiosaurus*, *Cynognathus*, *Dicynodon*. Among the fishes may be mentioned *Platysomus*, *Palaeoniscus*, *Amblypterus*, *Pleuracanthus*. Turning to the invertebrates, undoubtedly the most interesting feature is gradual introduction into the Cephalopoda of the ammonite-like forms such as *Medlicottia*, *Waagenoceras*, *Popanoceras*, in place of the more simple lobed goniatites of the Carboniferous. Brachiopods (*Productus horridus*, *Bakevellia tumida*), Bryozoa and corals were by no means scarce in the more open Permian seas. *Schizodus Schlotheimii*, *Strophalosia Goldfussi*, *Myophoria*, *Leimyalind*, *Bellerophon* are characteristic Permian molluscs. The last of the trilobites appears in the Permian of North America.

The evidence so far obtained indicates that in Permian times much of the land in the northern hemisphere was near the general sea-level, and that conditions of considerable aridity prevailed which involved the repeated isolation and evaporation of marine lagoons and land-locked seas. South of this region in Europe and Asia there extended an open "Mediterranean" sea, the "Tethys" of E. Suess; while over an enormous area in the southern hemisphere a great land area was spread, "Gondwāna land," the land of the Glossopteris flora. At many points in this vast tract, as we have seen, coarse conglomeratic deposits, Talchir, Dwyka, Bacchus Marsh, &c., indicate profound glacial conditions, which some have thought were present also in Britain, Germany and elsewhere in the north. Moderate earth movements were taking place in North America, where the Appalachian and Ouachita mountains were in course of elevation, and in Europe this was a time of great volcanic activity. In the Saal region volcanic rocks in the lower Rothliegende have been penetrated for 1100 ft. without reaching the bottom, and elsewhere in central Europe great sheets of contemporaneous quartz porphyry, granite porphyry, melaphyre and porphyrite are abundant with their corresponding tuffs. Melaphyres and tuffs appear in the Vosges, which in the south of France are enormous masses of melaphyre and quartz porphyry. Basic lavas and tuffs—diabase, picrite, olivine basalt and andesite tuffs—were erupted from many small vents in Ayrshire and the Nith basin, and basic lavas occur also in Devonshire. Volcanic rocks occur also in New Zealand, Sumatra and the Transvaal.

But on the west side of the Pennine Chain, and extending southwards into the central counties, the calcareous zone disappears, and we have a great accumulation of red, arenaceous and gravelly rocks.

The lower subdivision attains its greatest development in the vale of the Eden, where it consists of brick-red sandstones, the Penrith sandstone series, with some beds of calcareous conglomerate or breccia, locally known as "brockram," derived from the waste of the Carboniferous Limestone. These red rocks extend across the Solway into the valleys of the Nith and Annan, in the south of Scotland, where they lie unconformably on the Lower Silurian rocks. Their breccias consist of fragments of the adjacent Silurian greywackes and shales, but near Dumfries some calcareous breccias or "brockrams" occur. These brecciated masses have evidently accumulated in small lakes or narrow fiords. Much farther south, in Staffordshire, and in the districts of the Clent and Abberley Hills, the brecciated conglomerates in the Permian series attain a thickness of 400 ft. They have been shown by Sir A. C. Ramsay to consist in large measure of volcanic rocks, grits, slates and limestones, which can be identified with rocks on the borders of Wales. Some of the stones are 3 ft. in diameter and show distinct striation. The same writer pointed out that these Permian drift-beds cannot be distinguished by any essential character from modern glacial drifts; on the other hand, W. W. King and others have opposed this view.

The middle subdivision is the chief repository of fossils in the Permian system. Its strata are not red, but consist of a lower zone of hard brown shale with occasional thin limestone bands (Marl Slate) and an upper thick mass of dolomite (Magnesian Limestone). The latter is the chief feature in the Permian development of the east of England. It corresponds with the *Zechstein* of Germany, as the Marl Slate does with the *Kupfer-schiefer*. It is a very variable rock in its lithological characters, being sometimes dull, earthy, fine-grained and fossiliferous, in other places quite crystalline, and composed of globular, reniform, botryoidal, or other irregular concretions of crystalline and frequently internally radiated dolomite. Though the Magnesian Limestone runs as a thick persistent zone down the east of England, it is represented on the Lancashire and Cheshire side by bright red and variegated sandstone covered by a thin group of red marls, with numerous thin courses of limestone, containing *Schizodus*, *Bakevellia* and other characteristic fossils of the Magnesian Limestone.

Concerning the rocks classed as Permian in the central counties of England there exists some doubt, for recent work tends to show that the lower parts are clearly related to the Carboniferous rocks, by their fossils; while there is little evidence to warrant the exclusion of the higher beds from the Trias. Similarly in south Devon, where red sandstones and coarse breccias are well exposed, it has been found difficult to say whether the series should be regarded as Triassic or Permian, though the prevailing tendency is to retain them in the latter system.

The "Dyas" type of the system is found in enormous masses of strata flanking the Harz Mountains, and also in the Rhine provinces, Saxony, Thuringia, Bavaria and Bohemia. In general terms it may be said that in this region there is a lower sandy and conglomeratic subdivision with an upper one more calcareous; the former is known as the *Rothliegende*, the latter as the *Zechstein* group. On the south side of the Harz Mountains the following subdivisions are recognized:—

Zechstein Group.	Upper	Anhydrite, gypsum, rock-salt, dolomite, marl, fetid shale and limestone. The amorphous gypsum is the chief member of this group; the limestone is sometimes full of bitumen.
	Middle	Dolomite (*Haupt-dolomit*), crystalline granular (*Rauchwacke*), and fine powdery (*Asche*) with gypsum at bottom.
	Lower	Zechstein-limestone, an argillaceous, thin-bedded compact limestone 15 to 90 ft. thick. Kupfer-schiefer, a black bituminous copper-bearing shale, not more than 2 ft. thick, often much less, but very constant. Zechstein-conglomerate and calcareous sandstone.
Rothliegende Group.	Upper	Red sandstones (*Kreuznach* beds), red shales (*Monsig* beds) with sheets of melaphyre tuff, and quartz-porphyry-conglomerate (*Wadern*, *Oberhof*, *Sötern* and *Tambach* beds).
	Lower	Sandstones and glomerates (*Tholayer* beds) on black shales with poor coal seams and clay ironstones (*Lebach* and *Goldlauter* beds). Sandstones and shales with seams of coal on red and grey sandstones and shales with impure limestones (*Cusel* beds, including Manebach beds, upper, and Gehren beds, lower).

The name *Rothliegende* or *Rothtodtliegende* (red-dead-layer) was given by the miners because their ores disappeared in the red rocks below the copper-bearing Kupfer-schiefer. The Kupfer-schiefer, although so thin, has been worked in the Mansfeld district for a long period; it contains abundant remains of fish (*Palaeoniscus*, *Platysomus*) and plants (*Ullmannia*). The beds of rock-salt in the German Zechstein are of the greatest importance; at Sperenberg near Berlin it has been penetrated to a depth of 4000 ft. Associated with the salt, gypsum and anhydrite are numerous

Protestant faith was strengthened during Edward VI.'s reign; he was appointed a royal chaplain and canon of Windsor. Soon after Mary's accession, however, he perceived the error of his ways and was made master of Peterhouse in 1554 and dean of Ely in 1557. He preached the sermon in 1556 when the bodies of Bucer and Fagius were disinterred and burnt for heresy, and also in 1560 when these proceedings were reversed and the dead heretics were rehabilitated. In Elizabeth's reign he subscribed the Thirty-nine Articles, denounced the pope and tried to convert Abbot Feckenham to Protestantism; and in 1584 Whitgift in vain recommended him for a bishopric. He died on the 26th of April 1589. He was selected as the type of Anglican prelate by the authors of the Martin Mar-prelate tracts and other Puritans, who nicknamed him "Old Andrew Turncoat," "Andrew Ambo," "Old Father Palinode." Cambridge wits, it was said, translated "perno" by "I turn, I rat, I change often"; and a coat that had often been turned was said to have been "perned." (A. F. P.)

PÉRONNE, a town of northern France, capital of an arrondissement of the department of Somme, on the right bank of the Somme at its confluence with the Cologne, 35 m. E. by N. of Amiens by rail. Pop. (1906), 3698. The church of St Jean (1509–1525) was greatly damaged during the bombardment of 1870–71, but has since been restored. The castle of Péronne still retains four large conical-roofed towers dating from the middle ages, one of which is said to have been the prison of Louis XI. in 1468, when he was forced to agree to the "Treaty of Péronne." Péronne has a sub-prefecture, a tribunal of first instance, and a communal college. Its trade and industry are of little importance.

The Frankish kings had a villa at Péronne, which Clovis II. gave to Erchinoaldus, mayor of the palace. The latter founded a monastery here, and raised in honour of St Fursy a collegiate church, which was a wealthy establishment until the Revolution; it is the burial-place of Charles the Simple, who died of starvation in a dungeon in Péronne, into which he had been thrown by the count of Vermandois (929). After the death of Philip of Alsace, Péronne, which he had inherited through his wife, escheated to the French Crown in the reign of Philip Augustus, from whom in 1209 it received a charter. By the treaty of Arras (1435) it was given to the Burgundians; bought back by Louis XI., it passed again into the hands of Charles the Bold in 1465. On the death of Charles, however, in 1477, Louis XI. resumed possession. In 1536 the emperor Charles V. besieged Péronne, but without success; in its defence a woman called Marie Fouré greatly distinguished herself. A statue of her stands in the town; and the anniversary of the raising of the siege is still celebrated annually. It was the first town after Paris at which the League was proclaimed in 1577. Péronne's greatest misfortunes occurred during the Franco-German War. It was invested on the 27th of December 1870, and bombarded from the 28th to the 9th of the following January, upon which date, on account of the sufferings of the civil population, among whom small-pox had broken out, it was compelled to capitulate.

PEROVSKITE, or PEROFSKITE, a mineral consisting of calcium titanate, $CaTiO_3$, usually with a small proportion of the calcium replaced by iron. The crystals found in schistose rocks have the form of cubes, which are sometimes modified on the edges and corners by numerous small planes; on the other hand, the crystals occurring as an accessory constituent of eruptive rocks are octahedral in form and microscopic in size. Although geometrically cubic, the crystals are always doubly refracting, and they sometimes show evidence of complex mimetic twinning; their structure as shown in polarized light is very similar to that of the mineral boracite, and they are therefore described as pseudo-cubic. There are distinct cleavages parallel to the faces of the cube. The colour varies from pale yellow to blackish-brown and the lustre is adamantine to metallic; the crystals are transparent to opaque. The index of refraction is high, the hardness 5½, and the specific gravity 4·0. The mineral was discovered at Achmatovsk near Zlatonst in the Urals by G. Rose in 1839, and named in honour of Count L. A. Perovsky; at this locality large cubes occur with calcite and magnetite in a chlorite-schist. Similar crystals are also found in talc-schist at Zermatt in Switzerland. The microscopic octahedral crystals are characteristic of melilite basalt and nepheline basalt; they have also been found in peridotite and serpentine. (L. J. S.)

PEROWNE, JOHN JAMES STEWART (1823–1904), English bishop, was born, of Huguenot ancestry, at Burdwan, Bengal, on the 13th of March 1823. He was educated at Norwich and at Corpus Christi College, Cambridge, becoming a fellow in 1849. After holding a chair in King's College, London, he was appointed vice-principal at St David's College, Lampeter (1862–1872). In 1868 he was Hulsean lecturer, taking as his subject *Immortality*. He was elected canon of Llandaff in 1869, dean of Peterborough 1878, and in 1891 succeeded Henry Philpott as bishop of Worcester. Perowne was a good Hebrew scholar of the old type and sat on the Old Testament Revision Committee. He is best remembered as the general editor of the *Cambridge Bible for Schools and Colleges*. His chief works were a *Commentary on the Book of Psalms* (2 vols., 1864–1868) and a life of Bishop Thirlwall (1877–1878). He resigned his see in 1901, and died on the 6th of November 1904.

PĒRŌZ (*Peirozes*, Priscus, *fr.* 33; *Perozes*, Procop. *Pers.* i. 3 and Agath. iv. 27; the modern form of the name is Feroz, Firuz, cf. FIRUZABAD), Sassanid king of Persia, A.D. 457–484, son of Yazdegerd II. He rebelled against his brother Homizd III., and in 459 defeated and killed him with the help of the Ephthalites, or White Huns, who had invaded Bactria. He also killed most of his other relatives, and persecuted the Christians. But he favoured the introduction of Nestorianism, in opposition to the orthodox creed of Byzantium. With the Romans he maintained peace, but he tried to keep down the Ephthalites, who began to conquer eastern Iran. The Romans supported him with subsidies; but all his wars were disastrous. Once he was himself taken prisoner and had to give his son Kavadh as hostage till after two years he was able to pay a heavy ransom. Then he broke the treaty again and advanced with a large army. But he lost his way in the eastern desert and perished with his whole army (484). The Ephthalites invaded and plundered Persia for two years, till at last a noble Persian from the old family of Karen, Zarmihr (or Sokhra), restored some degree of order. He raised Balash, a brother of Pērōz, to the throne. (ED. M.)

PERPENDICULAR PERIOD, the term given by Thomas Rickman to the third period of Gothic architecture in England, in consequence of the great predominance of perpendicular lines. In the later examples of the Decorated period the omission of the circles in the tracery had led to the employment of curves of double curvature which developed into flamboyant tracery, and the introduction of the perpendicular lines was a reaction in the contrary direction. The mullions of the windows (which are sometimes of immense size, so as to give greater space for the stained glass) are carried up into the arch mould of the windows, and the upper portion is subdivided by additional mullions. The buttresses and wall surface are likewise divided up into vertical panels. The doorways are frequently enclosed within a square head over the arch mouldings, the spandrils being fitted with quatrefoils or tracery. Inside the church the triforium disappears, or its place is filled with panelling, and greater importance is given to the clerestory windows which constitute the finest features in the churches of this period. The mouldings are flatter and less effective than those of the earlier periods, and one of the chief characteristics is the introduction of large elliptical hollows. The finest features of this period are the magnificent timber roofs, such as those of Westminster Hall (1395), Christ Church Hall, Oxford, and Crosby Hall.

The earliest examples of the Perpendicular period, dating from 1360, are found at Gloucester, where the masons of the cathedral would seem to have been far in advance of those in other towns. Among other buildings of note are the choir and tower of York Cathedral (1389–1407); the nave and western transepts of Canterbury Cathedral (1378–1411), and the tower

(towards the end of the 15th century); New College, Oxford (1380–1386); the Beauchamp Chapel, Warwick (1381–1391); the nave and aisles of Winchester Cathedral (1399–1419); the transept and tower of Merton College, Oxford (1424–1450); Manchester Cathedral (1422); the central tower of Gloucester Cathedral (1454–1457), and that of Magdalen College, Oxford (1475–1480). To those examples should be added the towers at Wrexham, Coventry, Evesham, and St Mary's at Taunton, the first being of exceptional magnificence.

PERPENT, or PARPENT STONES, in architecture, bond or "through stones," the διατόνοι of the Greeks and Romans, long stones going right through walls, and tying them together from face to face. The O. Fr. *parpain*, modern *parpaing*, from which this word is derived, is obscure in origin. It may be from a supposed Lat. *perpago, perpaginis*, formed like *compago*, a joint, from the root of *pangere*, to fasten, and meaning "something fastened together," or from some popular corruption of Lat. *perpendiculum*, plummet or plumb-line (*pir* or *pendere*, to hang), referring to the smooth perpendicular faces of the stone.

PERPETUAL MOTION, or PERPETUUM MOBILE, in its usual significance, not simply a machine which will go on moving for ever, but a machine which, once set in motion, will go on doing useful work without drawing on any external source of energy, or a machine which in every complete cycle of its operation will give forth more energy than it has absorbed. Briefly, a perpetual motion usually means a machine which will create energy.

The earlier seekers after the "perpetuum mobile" did not always appreciate the exact nature of their quest; for we find among their ideals a clock that would periodically rewind itself, and thus go without human interference as long as its machinery would last. The energy created by such a machine would simply be the work done in overcoming the friction of its parts, so that its projectors might be held merely to have been ignorant of the laws of friction and of the dynamic theory of heat. Most of the perpetual motionists, however, had more practical views, and explicitly declared the object of their inventions to be the doing of useful work, such as raising water, grinding corn, and so on. Like the exact quadrature of the circle, the transmutation of metals and other famous problems of antiquity, the perpetual motion has now become a venerable paradox. Still, like these others, it retains a great historical interest. Just as some of the most interesting branches of modern pure mathematics sprang from the problem of squaring the circle, as the researches of the alchemists developed into the science of modern chemistry, so, as the result of the vain search after the perpetual motion, there grew up the greatest of all the generalizations of physical science, the principle of the conservation of energy.

There was a time when the problem of the perpetual motion was one worthy of the attention of a philosopher. Before that analysis of the action of ordinary machines which led to the laws of dynamics, and the discussion of the dynamical interdependence of natural phenomena which accompanied the establishment of the dynamical theory of heat, there was nothing plainly unreasonable in the idea that work might be done by the mere concatenation of machinery. It had not then been proved that energy is uncreatable and indestructible in the ordinary course of nature; even now that proof has only been given by induction from long observation of facts. There was a time when wise men believed that a spirit, whose maintenance would cost nothing, could by magic art be summoned from the deep to do his master's work; and it was just as reasonable to suppose that a structure of wood, brass and iron could be found to work under like conditions. The disproof is in both cases alike. No such spirit has ever existed, save in the imagination of his describer, and no such machine has ever been known to act, save in the fancy of its inventor.

The principle of the conservation of energy, which in one sense is simply denial of the possibility of a perpetual motion, rests on facts drawn from every branch of physical science; and, although its full establishment only dates from the middle of the 19th century, yet so numerous are the cases in which it has been tested, so various the deductions from it that have been proved to accord with experience, that it is now regarded as one of the best-established laws of nature. Consequently, on any one who calls it in question is thrown the burden of proving his case. If any machine were produced whose source of energy could not at once be traced, a man of science (complete freedom of investigation being supposed) would in the first place try to trace its power to some hidden source of a kind already known; or in the last resort he would seek for a source of energy of a new kind and give it a new name. Any assertion of creation of energy by means of a mere machine would have to be authenticated in many instances, and established by long investigation, before it could be received in modern science. The case is precisely as with the law of gravitation; if any apparent exception to this were observed in the case of some heavenly body, astronomers, instead of denying the law, would immediately seek to explain the occurrence by a wider application of it, say by including in their calculations the effect of some disturbing body hitherto neglected. If a man likes to indulge the notion that, after all, an exception to the law of the conservation of energy may be found, and, provided he submits his idea to the test of experiment at his own charges without annoying his neighbours, all that can be said is that he is engaged in an unpromising enterprise. The case is otherwise with the projector who comes forward with some machine which claims by the mere ingenuity of its contrivance to multiply the energy supplied to it from some of the ordinary sources of nature and sets to work to pester scientific men to examine his supposed discovery, or attempts therewith to induce the credulous to waste their money. This is by far the largest class of perpetual-motion-mongers nowadays. The interest of such cases is that attaching to the morbid anatomy of the human mind. Perhaps the most striking feature about them is the woful sameness of the symptoms of their madness. As a body perpetual-motion seekers are ambitious, lovers of the short path to wealth and fame, but wholly superficial. Their inventions are very rarely characterized even by mechanical ingenuity. Sometimes indeed the inventor has simply bewildered himself by the complexity of his device; but in most cases the machines of the perpetual motionist are of child-like simplicity, remarkable only for the extraordinary assertions of the inventor concerning them. Wealth of ideas there is none; simply assertions that such and such a machine solves the problem, although an identical contrivance has been shown to do no such thing by the brutal test of standing still in the hands of many previous inventors. Hosts of the seekers for the perpetual motion have attacked their insoluble problem with less than a schoolboy's share of the requisite knowledge; and their confidence as a rule is in proportion to their ignorance. Very often they get no further than a mere prospectus, on the strength of which they claim some imaginary reward, or offer their precious discovery for sale; sometimes they get the length of a model which wants only the last perfection (already in the inventor's brain) to solve the great problem; sometimes fraud is made to supply the motive power which their real or pretended efforts have failed to discover.

It was no doubt the barefaced fallacy of most of the plans for perpetual motion that led the majority of scientific men to conclude at a very early date that the "perpetuum mobile" was an impossibility. We find the Paris Academy of Sciences refusing, as early as 1775, to receive schemes for the perpetual motion, which they class with solutions of the duplication of the cube, the trisection of an angle and the quadrature of the circle. Stevinus and Leibnitz seem to have regarded its impossibility as axiomatic; and Newton at the beginning of his *Principia* states, so far as ordinary mechanics are concerned, a principle which virtually amounts to the same thing.

The famous proof of P. De la Hire simply refers to some of the more common gravitational perpetual motions. The truth is, as we have said already, that, if proof is to be given, or considered necessary, it must proceed by induction from all physical phenomena.

It would serve no useful purpose here to give an exhaustive historical account[1] of the vagaries of mankind in pursuit of the "perpetuum mobile." The reader may refer to Henry Dircks's *Perpetuum Mobile* (2 vols., 1861 and 1870), from which, for the most part, we select the following facts.

By far the most numerous class of perpetual motions is that which seeks to utilize the action of gravity upon rigid solids. We have not read of any actual proposal of the kind, but the most obvious thing to imagine in this way would be to procure some substance which intercepts gravitational attraction. If this could be had, then, by introducing a plate of it underneath a body while it was raised, we could elevate the body without doing work; then, removing the plate, we could allow the body to fall and do work; eccentrics or other imposing device being added to move the gravitation intercepter, behold a perpetual motion complete! The great difficulty is that no one has found the proper material for an intercepter.

Fig. 1 represents one of the most ancient and oftenest-repeated of gravitational perpetual motions. The idea is that the balls rolling in the compartments between the felloe and the rim of the wheel will, on the whole, so comport themselves that the moment about the centre of those on the descending side exceeds the moment of those on the ascending side. Endless devices, such as curved spokes, levers with elbow-joints, eccentrics, &c., have been proposed for effecting this impossibility. The student of dynamics at once convinces himself that no machinery can effect any such result; because if we give the wheel a complete turn, so that each ball returns to its original position, the whole work done by the ball will, at the most, equal that done on it. We know that if the laws of motion be true, in each step the kinetic energy given to the whole system of wheel and balls is equal to that taken from the potential energy of the balls less what is dissipated in the form of heat by frictional forces, or vice versa, if the wheel and balls be losing kinetic energy—save that the friction in both cases leads to dissipation. So that, whatever the system may lose, it can, after it is left to itself, never gain energy during its motion.

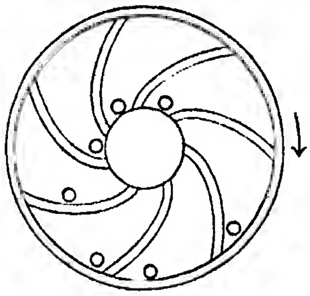

FIG. 1.

The two most famous perpetual motions of history, viz. the wheels of the marquess of Worcester (d. 1667) and of Councillor Orffyraeus, were probably of this type. The marquess of Worcester gives the following account of his machine in his *Century of Inventions* (art. 56):—

"To provide and make that all the Weights of the descending side of a Wheel shall be perpetually further from the Centre than those of the mounting side, and yet equal in number and heft to one side as the other. A most incredible thing, if not seen but tried before the late king (of blessed memory) in the *Tower*, by my directions, two Extraordinary Embassadors accompanying His Majesty, and the Duke of *Richmond*, and Duke *Hamilton*, with most of the Court, attending him. The Wheel was 14. Foot over, and 40. Weights of 50. pounds apiece. Sir *William Balfore*, then Lieutenant of the *Tower*, can justify it, with several others. They all saw that no sooner these great Weights passed the Diameter-line of the lower side, but they hung a foot further from the Centre, nor no sooner passed the Diameter-line of the upper side but they hung a foot nearer. Be pleased to judge the consequence."

Orffyraeus (whose real name was Johann Ernst Elias Bessler) (1680–1745) also obtained distinguished patronage for his invention. His last wheel, for he appears to have constructed more than one, was 12 ft. in diameter and 1 ft. 2 in. broad; it consisted of a light framework of wood, covered in with oilcloth so that the interior was concealed, and was mounted on an axle which had no visible connexion with any external mover. It was examined and approved of by the landgrave of Hesse-Cassel, in whose castle at Weissenstein it is said to have gone for eight weeks in a sealed room. The most remarkable thing about this machine is that it evidently imposed upon the mathematician W. J. 'sGravesande, who wrote a letter to Newton giving an account of his examination of Orffyraeus's wheel undertaken at the request of the landgrave, wherein he professes himself dissatisfied with the proofs theretofore given of the impossibility of perpetual motion, and indicates his opinion that the invention of Orffyraeus is worthy of investigation. He himself, however, was not allowed to examine the interior of the wheel. The inventor seems to have destroyed it himself. One story is that he did so on account of difficulties with the landgrave's government as to a licence for it; another that he was annoyed at the examination by 'sGravesande, and wrote on the wall of the room containing the fragments of his model that he had destroyed it because of the impertinent curiosity of 'sGravesande.

The overbalancing wheel perpetual motion seems to be as old as the 13th century. Dircks quotes an account of an invention by Wilars de Honecort, an architect whose sketchbook is still preserved in the Écoles des Chartes at Paris. De Honecort says, "Many a time have skilful workmen tried to contrive a wheel that shall turn of itself; here is a way to do it by means of an uneven number of mallets, or by quicksilver." He thereupon gives a rude sketch of a wheel with mallets jointed to its circumference. It would appear from some of the manuscripts of Leonardo da Vinci that he had worked with similar notions.

Another scheme of the perpetual motionist is a water-wheel which shall feed its own mill-stream. This notion is probably as old as the first miller who experienced the difficulty of a dry season. One form is figured in the *Mathematical Magic* (1648) of Bishop Wilkins (1614–1672); the essential part of it is the water-screw of Archimedes, which appears in many of the earlier machines of this class. Some of the later ones dispense with even the subtlety of the water-screw, and boldly represent a water-wheel pumping the water upon its own buckets.

Perpetual motions founded on the hydrostatical paradox are not uncommon; Denis Papin exposes one of these in the *Philosophical Transactions* for 1685. The most naïve of these devices is that illustrated in fig. 2, the idea of which is that the larger quantity of water in the wider part of the vessel weighing more will overbalance the smaller quantity in the narrower part, so that the water will run over at C, and so on continually.

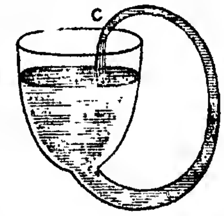

FIG. 2.

Capillary attraction has also been a favourite field for the vain quest; for, if by capillary action fluids can be made to disobey the law of never rising above their own level, what so easy as thus to produce a continual ascent and overflow, and thus perpetual motion? Various schemes of this kind, involving an endless band which should raise more water by its capillary action on one side than on the other, have been proposed. The most celebrated is that of Sir William Congreve (1772–1828). EFG (fig. 3) is an inclined plane over pulleys; at the top and bottom travels an endless band of sponge, *abcd*, and over this again an endless band of heavy weights jointed together. The whole stands over the surface of still water. The capillary action raises the water in *ab*, whereas the same thing cannot happen in the part *ad*, since the weights squeeze the water out. Hence, inch for inch, *ab* is heavier than *ad*; but we know that if *ab* were only just as heavy inch for inch as *ad* there would be equilibrium, if the heavy chain be also uniform; therefore the extra weight of *ab* will cause the chain to move round in the direction of the arrow, and this will go on continually.

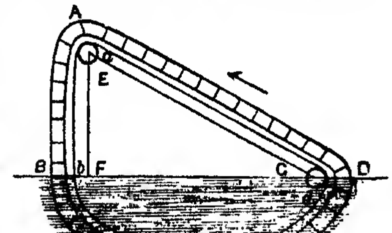

FIG. 3.

The more recondite vehicles of energy, such as electricity and magnetism, are more seldom drawn upon by perpetual-motion inventors than might perhaps be expected. William Gilbert, in his treatise *De Magnete*, alludes to some of them, and Bishop Wilkins mentions among others a machine "wherein a loadstone is so disposed

[1] We may here notice, so far as more recent times are concerned, the claim of an American enthusiast, who, having worked a Hampson plant for liquefying air, stated that 3 ℔ of liquid air sufficed to liquefy ten, and of these ten seven could be employed as a source of motive power, whilst the remaining three could be utilized in the production of another 10 ℔ of the liquid gas. There was thus available an inexhaustible supply of energy! The absurdity of the proposition is obvious to any one acquainted with the laws of thermodynamics. Of more interest is the radium clock devised by the Hon. R. J. Strutt. This consists of a vacuum vessel from the top of which depends a short tube containing a fragment of a radioactive substance. At the lower end of this tube there are two gold leaves as in an electroscope. Fused into the sides of the vacuum vessel at points where the extended gold leaves touch the glass are two platinum wires, the outer ends of which are earthed. The "clock" acts as follows. The radio-active substance emits a preponderating number of positively electrified particles, so that the leaves become charged and hence extended. On contact with the wires fused into the vessel, this charge is conducted away and the leaves fall together. The process is then repeated, and will continue until all the energy of the radium has been dissipated. This period is extremely long, for 1000 years must elapse before even half the radium has disappeared.—ED.

that it shall draw unto it on a reclined plane a bullet of steel, which, still, as it ascends near to the loadstone, may be contrived to fall through some hole in the plane and so to return unto the place whence at first it began to move, and being there, the loadstone will again attract it upwards, till, coming to this hole, it will fall down again, and so the motion shall be perpetual." The fact that screens do exist whereby electrical and magnetic action can be cut off would seem to open a door for the perpetual-motion seeker. Unfortunately the bringing up and removing of these screens involves in all cases just that gain or loss of work which is demanded by the law of the conservation of energy. A shoemaker of Linlithgow called Spence pretended that he had found a black substance which intercepted magnetic attraction and repulsion, and he produced two machines which were moved, as he asserted, by the agency of permanent magnets, thanks to the black substance. The fraud was speedily exposed, but it is worthy of remark that Sir David Brewster thought the thing worth mentioning in a letter to the *Annales de chimie* (1818), wherein he states "that Mr Playfair and Captain Kater have inspected both of these machines and are satisfied that they resolve the problem of perpetual motion."

The present writer once was sent an elaborate drawing of a locomotive engine which was to be worked by the agency of permanent magnets. He forgets the details, but it was not so simple as the plan represented in fig. 4, where M and N are permanent magnets, whose attraction is "screened" by the wooden blocks A and B from the upper left and lower right quadrants of the soft iron wheel W, which consequently is attracted round in the same direction by both M and N, and thus goes on for ever.

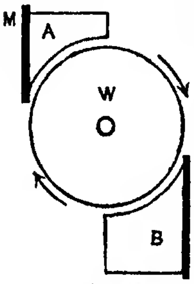

FIG. 4.

One more page from this chapter of the book of human folly; the author is the famous Jean Bernoulli the elder. We translate his Latin, as far as possible, into modern phraseology. In the first place we must premise the following (see fig. 5). (1) If there be two fluids of different densities whose densities are in the ratio of G to L, the height of equiponderating cylinders on equal bases will be in the inverse ratio of L to G. (2) Accordingly, if the height AC of one fluid, contained in the vase AD, be in this ratio to the height EF of the other liquid, which is in a tube open at both ends, the liquids so placed will remain at rest. (3) Wherefore, if AC be to EF in a greater ratio than L to G, the liquid in the tube will ascend; or if the tube be not sufficiently long the liquid will overflow at the orifice E (this follows from hydrostatic principles). (4) It is possible to have two liquids of different density that will mix. (5) It is possible to have a filter, colander, or other separator, by means of which the lighter liquid mixed with the heavier may be separated again therefrom.

Construction.—These things being presupposed (says Bernoulli), I thus construct a perpetual motion. Let there be taken in any (if you please, in equal) quantities two liquids of different densities mixed together (which may be had by hyp. 4), and let the ratio of their densities be first determined, and be the heavier to the lighter as G to L, then with the mixture let the vase AD be filled up to A. This done let the tube EF, open at both ends, be taken of such a length that $AC:EF>2L:G+L$; let the lower orifice F of this tube be stopped, or rather covered with the filter or other material separating the lighter liquid from the heavier (which may also be had by hyp. 5); now let the tube thus prepared be immersed to the bottom of the vessel CD; I say that the liquid will continually ascend through the orifice F of the tube and overflow by the orifice E upon the liquid below.

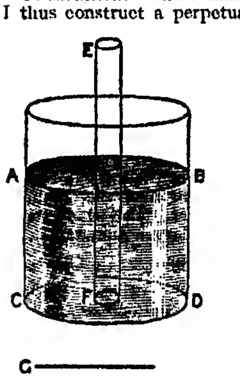

FIG. 5.

Demonstration.—Because the orifice F of the tube is covered by the filter (by constr.) which separates the lighter liquid from the heavier, it follows that, if the tube be immersed to the bottom of the vessel, the lighter liquid alone which is mixed with the heavier ought to rise through the filter into the tube, and that, too, higher than the surface of the surrounding liquid (by hyp. 2), so that $AC:EF=2L:G+L$; but since by constr. $AC:EF>2L:G+L$ it necessarily follows (by hyp. 3) that the lighter liquid will flow over by the orifice E into the vessel below, and there will meet the heavier and be again mixed with it; and it will then penetrate the filter, again ascend the tube, and be a second time driven through the upper orifice. Thus, therefore, will the flow be continued for ever.—Q.E.D.

Bernoulli then proceeds to apply this theory to explain the perpetual rise of water to the mountains, and its flow in rivers to the sea, which others had falsely attributed to capillary action—his idea being that it was an effect of the different densities of salt and fresh water.

One really is at a loss with Bernoulli's wonderful theory, whether to admire most the conscientious statement of the hypothesis, the prim logic of the demonstration, so carefully cut according to the pattern of the ancients, or the weighty superstructure built on so frail a foundation. Most of our perpetual motions were clearly the result of too little learning; surely this one was the product of too much. (G. Ch.)

PERPETUITY (Lat. *perpetuus*, continuous), the state of being perpetual or continuing for an indefinite time; in law the tying-up of an estate for a lengthened period, for the purpose of preventing or restricting alienation. As being opposed to the interest of the state and individual effort, the creation of perpetuities has been considerably curtailed, and the rule against perpetuities in the United Kingdom now forbids the making of an executory interest unless beginning within the period of any fixed number of existing lives and an additional period of twenty-one years (with a few months added, if necessary, for the period of gestation). The rule applies to dispositions of personal property (see ACCUMULATION) as well as of real property. There are certain exceptions to the rule, as in the case of limitations in mortmain and to charitable uses, and also in the case of a perpetuity created by act of parliament (*e.g.* the estate of Blenheim, settled on the duke of Marlborough, and Strathfieldsaye on the duke of Wellington). In the United States the English common-law rule against perpetuities obtains in many of the states; in others it has been replaced or reinforced by statutory rules (see Gray on *Alienation*, § 42). Charities may be established in perpetuity, and provision may be made for an accumulation of the funds for a reasonable time, *e.g.* for 100 years (*Woodruff* v. *Marsh*, 63 Conn. Rep. 125; 38 Amer. St. Rep. 346). The general tendency of American legislation is to favour tying up estates to a greater extent than was formerly approved.

PERPIGNAN, a town of south-western France, capital of the department of Pyrénées-Orientales, on the right bank of the Têt, 7 m. from the Mediterranean and 42 m. S. by W. of Narbonne by rail. Pop. (1906), town, 32,683; commune, 38,898. The north-west quarter of the town is traversed by the Basse, a tributary of the Têt, while to the south it is overlooked by a citadel enclosing a castle (13th century) of the kings of Majorca. The chapel is remarkable as being a mixture of the Romanesque, Pointed and Moorish styles. The ramparts surrounding the citadel are the work of Louis XI., Charles V. and Vauban. The sculptures and caryatides still to be seen on the gateway of the citadel were placed there by the duke of Alva. The cathedral of St Jean was begun in 1324 and finished in 1509. The most noteworthy feature in the building is an immense reredos of white marble (early 17th century) by Bartholomew Soler of Barcelona.

In the north of the town commanding the gateway of Notre-Dame (1481) there stands a curious machicolated stronghold known as the Castillet (14th and 15th centuries), now used as a prison. The buildings of the old university (18th century) contain the library and the museum, the latter possessing the first photographic proofs executed by Daguerre and a collection of sculptures and paintings. Statues of François Arago, the astronomer, and Hyacinthe Rigaud, the painter, stand in the squares named after them.

Perpignan is a fortified place of the first class, and seat of a prefect, a bishop and a court of assizes, and has tribunals of first instance and of commerce, a chamber of commerce, a branch of the Bank of France, a communal college for boys, a school of music and training colleges for both sexes. The higher tribunal of Andovie sits at Perpignan. Trade is in wine, iron, wool, oil, corks and leather.

Perpignan dates at least from the 10th century. In the 11th and 12th centuries it was a capital of the counts of Roussillon, from whom it passed in 1172 to the kings of Aragon. Philip the Bold, king of France, died there in 1285, as he was returning from an unsuccessful expedition into Aragon. At that time it belonged to the kingdom of Majorca, and its sovereigns resided there until, in 1344, that small state reverted to the possession of the

kings of Aragon, who in 1349 founded a university at Perpignan. When Louis XI. occupied Roussillon as security for money advanced by him to the king of Aragon, Perpignan resisted the French arms for a considerable time, and only yielded through stress of famine (March 15, 1475). Roussillon was restored to Aragon by Charles VIII. and Perpignan was again besieged in 1542 under Francis I., but without success. Later on, however, the inhabitants, angered by the tyranny and cruelty of the Spanish governor, surrendered the town to Louis XIII. The citadel held out until the 9th of September 1642, and the place has ever since belonged to France, to which it was formally ceded by the Treaty of the Pyrenees (1659). In 1602 the bishopric of Elne was transferred to Perpignan.

See P. Vibal, *Perpignan depuis les origines jusqu'à nos jours* (Paris, 1898).

PERQUISITE (Lat. *perquisitum*, that which has been acquired by careful search; *perquirere*, to search diligently), a term properly used of the profits which accrue to the holder of an office over and above the regular emoluments; also, in law, the casual profits, such as accrue by heriots, fines, reliefs, &c., to a lord of a manor above the yearly revenue from the copyholds. The word is used generally of the casual profits allowed by custom to servants or other employés from superfluous articles which the employer has enjoyed the use of or which are supposed not to be needed.

PERRAULT, CHARLES (1628–1703), French author, was born in Paris on the 12th of January 1628. His father, Pierre Perrault, was a barrister, all of whose four sons were men of some distinction: Claude (1613–1688), the second, was by profession a physician, but became the architect of the Louvre, and translated Vitruvius (1673). Charles was brought up at the Collège de Beauvais, until he chose to quarrel with his masters, after which he was allowed to follow his own bent in the way of study. He took his degree of *licencié en droit* at Orleans in 1651, and was almost immediately called to the Paris bar, where, however, he practised for a very short time. In 1654 his brother became receiver-general of Paris, and made Charles his clerk. After nearly ten years of this employment he was, in 1663, chosen by Colbert as his secretary to assist and advise him in matters relating to the arts and sciences, not forgetting literature. He was controller-general of the department of public works, member of the commission that afterwards developed into the *Académie des inscriptions*, and in 1671 he was admitted to the *Académie française*. Perrault justified his election in several ways. One was the orderly arrangement of the business affairs of the Academy, another was the suggestion of the custom of holding public séances for the reception of candidates. Colbert's death in 1683 put an end to Perrault's official career, and he then gave himself up to literature, beginning with *Saint Paulin évêque de Nole, avec une épître chrétienne sur la pénitence, et une ode aux nouveaux convertis*. The famous dispute of the ancients and moderns arose from a poem on the *Siècle de Louis le Grand* (1687), read before the Academy by Perrault, on which Boileau commented in violent terms. Perrault had ideas and a will of his own, and he published (4 vols., 1688–1696) his *Parallèle des anciens et des modernes*. The controversy that followed in its train raged hotly in France, passed thence to England, and in the days of Antoine Houdart de la Motte and Fénelon broke out again in the country of its origin. As far as Perrault is concerned he was inferior to his adversaries in learning, but decidedly superior to them in wit and politeness.

It is not known what drew Perrault to the composition of the only works of his which are still read, but the taste for fairy stories and Oriental tales at court is noticed by Mme de Sevigné in 1676, and at the end of the 17th century gave rise to the fairy stories of Mlle L'Héritier de Villaudon, whose *Bigarrures ingénieuses* appeared in 1696, of Mme d'Aulnoy and others, while Antoine Galland's translation of the *Thousand-and-One Nights* belongs to the early years of the 18th century. The first of Perrault's contes, *Grisélidis*, which is in verse, appeared in 1691, and was reprinted with *Peau d'âne* and *Les Souhaits ridicules*, also in verse, in a *Recueil de pièces curieuses*—published at the Hague in 1694. But Perrault was no poet, and the merit of these pieces is entirely obscured by that of the prose tales, *La Belle au bois dormant*, *Petit chaperon rouge*, *La Barbe bleue*, *Le Chat botté*, *Les Fées*, *Cendrillon*, *Riquet à la houppe* and *Le Petit poucet*, which appeared in a volume with 1697 on the title-page, and with the general title of *Histoires ou contes du temps passé avec des moralités*. The frontispiece contained a placard with the inscription, *Contes de ma mère l'oie*. In 1876 Paul Lacroix attributed the stories to the authorship of Perrault's son, P. Darmancour, who signed the dedication, and was then, according to Lacroix, nineteen years old. Andrew Lang has suggested that the son was a child, not a young man of nineteen, that he really wrote down the stories as he heard them, and that they were then edited by his father. This supposition would explain the mixture of naïveté and satire in the text. Perrault's other works include his *Mémoires* (in which he was assisted by his brother Claude), giving much valuable information on Colbert's ministry; an *Enéide travestie* written in collaboration with his two brothers, and *Les Hommes illustres qui ont paru en France pendant ce siècle* (2 vols., 1696–1700). He died on the 16th of May 1703, in Paris. His son, Perrault d'Arma-Court, was the author of a well-known book, *Contes des fées*, containing the story of Cinderella, &c.

Except the tales, Perrault's works have not recently been reprinted. Of these there are many modern editions, *e.g.* by Paul Lacroix (1876), and by A. Lefèbvre ("Nouvelle collection Jannet," 1875); also *Perrault's Popular Tales* (Oxford, 1888), which contains the French text edited by Andrew Lang, with an introduction, and an examination of the sources of each story. See also Hippolyte Rigault, *Hist. de la querelle des anciens et des modernes* (1856).

PERRERS (or DE WINDSOR), **ALICE** (d. 1400), mistress of the English king Edward III., belonged probably to the Hertfordshire family of Perrers, although it is also stated that she was of more humble birth. Before 1366 she had entered the service of Edward's queen, Philippa, and she appears later as the wife of Sir William de Windsor, deputy of Ireland (d. 1384). Her intimacy with the king began about 1366, and during the next few years she received from him several grants of land and gifts of jewels. Not content with the great influence which she obtained over Edward, Alice interfered in the proceedings of the courts of law to secure sentences in favour of her friends, or of those who had purchased her favour; actions which induced the parliament of 1376 to forbid all women from practising in the law courts. Alice was banished, but John of Gaunt, duke of Lancaster, allowed her to return to court after the death of Edward the Black Prince in June 1376, and the parliament of 1377 reversed the sentence against her. Again attempting to pervert the course of justice, she was tried by the peers and banished after the death of Edward III. in June 1377; but this sentence was annulled two years later, and Alice regained some influence at court. Her time, however, was mainly spent in lawsuits, one being with William of Wykeham, bishop of Winchester, and another with her dead husband's nephew and heir, John de Windsor.

PERRON, PIERRE CUILLIER (1755–1834), French military adventurer in India, whose name was originally Pierre Cuillier, was born in 1755 at Château du Loire in France, the son of a cloth merchant. In 1780 he went out to India as a sailor on a French frigate, deserted on the Malabar coast, and made his way to upper India, where he enlisted in the rana of Gohad's corps under a Scotsman named Sangster. In 1790 he took service under De Boigne, and was appointed to the command of his second brigade. In 1795 he assisted to win the battle of Kardla against the nizam of Hyderabad, and on De Boigne's retirement became commander-in-chief of Sindhia's army. At the battle of Malpura (1800) he defeated the Rajput forces. After the defeat of Ujjain (1801) he refused to send his troops to the aid of Sindhia. His treachery on this occasion shook his position, and on the outbreak of war between Sindhia and the British in 1803 Perron was superseded and fled to the British camp. In the battles of Delhi, Laswari and Assaye, Perron's battalions were completely destroyed by Lord Lake and

Sir Arthur Wellesley. He returned to France with a large fortune, and died in 1834.

See H. Compton, *European Military Adventurers of Hindustan* (1892).

PERRON (a French word meaning properly a "large stone," Ital. *petrone*, from Lat. *petra*, Fr. *pierre*, stone), in architecture, a term applied to a raised platform reached by steps in front of the entrance to a building. The grand flight of external steps entering the mansions of the medieval nobility or high officials was considered in itself a mark of jurisdiction, as it is said that sentence was there pronounced against criminals, who were afterwards executed at the foot of the steps—as at the Giant's Stairs of the doge's palace at Venice.

PERRONE, GIOVANNI (1794–1876), Italian theologian, was born at Chieri (Piedmont) in 1794. He studied theology at Turin, and in his twenty-first year went to Rome, where he joined the Society of Jesus. In 1816 he was sent as professor of theology to Orvieto, and in 1823 was appointed to a similar post in the Collegium Romanum. From Ferrara, where he was rector of the Jesuit College after 1830, he returned to his teaching work in Rome, being made head of his old college in 1850. He took a leading part in the discussions which led up to the promulgation of the dogma of the Immaculate Conception (1854), and in 1869 was prominent on the Ultramontane side in the Vatican Council. His numerous dogmatic works are characteristic of orthodox modern Roman theology. They include *Praelectiones theologicae* (9 vols., Rome, 1835 sqq.), *Praelectiones theologicae in compendium redactae* (4 vols., Rome, 1845), *Il Hermesianismo* (Rome, 1838), *Il Protestantismo e la regola di fede* (3 vols., 1853), *De divinitate D. N. Jesu Christi* (3 vols., Turin, 1870). He died on the 26th of August 1876.

PERROT, SIR JOHN (*c.* 1527–1592), lord deputy of Ireland, was the son of Mary Berkley, who afterwards married Thomas Perrot, a Pembrokeshire gentleman. He was generally reputed to be a son of Henry VIII., and was attached to the household of William Paulet, 1st marquess of Winchester. He was in this way brought to the notice of Henry VIII., who died, however, before fulfilling his promises of advancement, but Perrot was knighted at the coronation of Edward VI. During Mary's reign he suffered a short imprisonment on the charge of harbouring his uncle, Robert Perrot, and other heretics. In spite of his Protestantism he received the castle and lordship of Carew in Pembrokeshire, and at the beginning of Elizabeth's reign he was entrusted with the naval defence of South Wales. In 1570 Perrot reluctantly accepted the newly created post of lord president of Munster. He landed at Waterford in February of the next year, and energetically set about the reduction of the province. In the course of two years he hunted down James Fitzmaurice Fitzgerald, whose submission he received in 1572. Perrot resented the reinstatement of Gerald Fitzgerald, 15th earl of Desmond, and after vainly seeking his own recall left Ireland without leave in July 1573, and presenting himself at court was allowed to resign his office, in which he was succeeded by Sir William Drury. He returned to his Welsh home, where he was fully occupied with his duties as vice-admiral of the Welsh seas and a member of the council of the marches. Although in 1578 he was accused by the deputy-admiral, Richard Vaughan, of tyranny, subversion of justice and of dealings with the pirates, he evidently retained the royal confidence, for he was made commissioner for piracy in Pembrokeshire in 1578, and in the next year was put in command of a squadron charged to intercept Spanish ships on the Irish coast.

The recall of Arthur Grey, Lord Grey de Wilton, in 1582, left vacant the office of lord deputy of Ireland, and Perrot was appointed to it early in 1584. Sir John Norris became lord president of Munster and Sir Richard Bingham went to Connaught. Perrot's chief instructions concerned the plantation of Munster, where the confiscated estates, some 600,000 acres in extent, of the earl of Desmond were to be given to English landlords at a nominal rent, provided that they brought with them English farmers and labourers. Before he had had time to embark on this enterprise he heard that the Highland clans of Maclean and MacDonnell were raiding Ulster at the invitation of Sorley Boy MacDonnell, the Scoto-Irish constable of Dunluce Castle. He marched into Ulster, but Sorley Boy escaped him, and crossed to Scotland, only to return later with reinforcements. The lord deputy was roundly abused by Elizabeth for undertaking "a rash, unadvised journey," but Sorley Boy was reduced to submission in 1586. In 1585 Perrot succeeded in completing the "composition of Connaught," a scheme for a contract between Elizabeth and the landholders of the province by which the queen should receive a small quit-rent. During his career as lord deputy he had established peace, and had deserved well of Elizabeth. But a rash and violent temper, coupled with unsparing criticism, not to say abuse, of his associates, had made him numerous enemies. A hastily conceived plan for the conversion of the revenues of St Patrick's Cathedral, Dublin, to provide funds for the erection of two colleges, led to a violent quarrel with Adam Loftus, archbishop of Armagh. Perrot had interfered in Bingham's government of Connaught, and in May 1587 he actually struck Sir Nicholas Bagenal, the knight marshal, in the council chamber. Elizabeth decided to supersede him in January 1588, but it was only six months later that his successor, Sir William Fitzwilliam, arrived in Dublin. After his return to England his enemies continued to work for his ruin, and a forged letter purporting to be from him to Philip II. of Spain gave colour to an accusation of treasonable correspondence with the queen's enemies, but when he was tried before a special commission in 1592 the charge of high treason was chiefly based on his alleged contemptuous remarks about Elizabeth. He was found guilty, but died in the Tower in September 1592. Elizabeth was said to have intended his pardon.

A life of Sir John Perrot from a MS. dating from the end of Elizabeth's reign was printed in 1728. Sir James Perrot (1571–1637), writer and politician, was his illegitimate son.

PERRY, MATTHEW CALBRAITH (1794–1858), American naval officer, was born in South Kingston, Rhode Island, on the 10th of April 1794. He became a midshipman in 1809, and served successively in the schooner "Revenge" (then commanded by his brother, Oliver H. Perry) and the frigate "President." In 1813 he became a lieutenant, and during the war of 1812 served in the frigate "United States" (which, when abandoned by Perry, was blockaded in the harbour of New London, Connecticut), the "President" and the "Chippewa." Soon after the war Perry was assigned to the Brooklyn (New York) navy yard, where he served till 1819. He became a commander in 1826, and during 1826–1830 was in the recruiting service at Boston, where he took a leading part in organizing the first naval apprentice system of the United States navy. He was promoted in 1837 to the rank of captain (then the highest actual rank in the United States navy), and in 1838–1840 commanded the "Fulton II.," the first American steam war vessel. He also planned the "Missouri" and the "Mississippi," the first steam frigates of the United States navy, and was in command of the Brooklyn navy yard from June 1841 until March 1843, when he assumed command of a squadron sent to the African coast by the United States, under the Webster-Ashburton treaty, to aid in suppressing the slave trade. This command of a squadron entitled him to the honorary rank of commodore. On the 23rd of October 1846, during the Mexican War, Perry, in command of the steam vessels "Vixen" and "McLane," and four schooners, attacked and captured Frontera, at the mouth of the Tobasco River, then pushed on up the river and (on the 24th) captured the town of Tobasco, thereby cutting off Mexico from Yucatan. He relieved Commodore David Conner at Vera Cruz on the 21st of March 1847, and after a two days' bombardment by a battery landed from the ships the city wall was breached sufficiently to admit the entrance of troops.

Commodore Perry's distinctive achievement, however, was his negotiation in 1854 of the treaty between the United States and Japan, which opened Japan to the influences of western civilization. Perry sailed from Norfolk, Virginia, on the 24th of November 1852, in the "Mississippi." He reached Hong-Kong

on the 7th of April and on the 8th of July dropped anchor off the city of Uraga, on the western shore of the Bay of Yedo with the "Susquehanna," his flagship, the "Mississippi," and the sloops-of-war "Saratoga" and "Plymouth." On the 14th of July, accompanied by his officers and escorted by a body of armed marines and sailors (in all about 300 men), he went ashore and presented to commissioners especially appointed by the shōgun to receive them, President Fillmore's letters to the emperor, and his own credentials. A few days later the American fleet sailed for Hong-Kong with the understanding that Perry would return in the following spring to receive the emperor's reply. On the 11th of February, accordingly, he reappeared in the Bay of Yedo with his fleet—this time composed of the "Susquehanna," "Powhatan" and "Mississippi," and the sailing vessels "Vandalia," "Lexington" and "Southampton," and despite the protests of the Japanese selected an anchorage about 12 m. farther up the bay, nearly opposite the present site of Yokohama, and within about 10 m. of Yedo (Tōkyō). Here, on the 31st of March 1854, was concluded the first treaty (ratified at Simoda, on the 21st of February 1855, and proclaimed on the 22nd of June following) between the United States and Japan. The more important articles of this treaty provided that the port of Simoda, in the principality of Idzu, and the port of Hakodate, in the principality of Matsmai, were constituted as ports for the reception of American ships, where they could buy such supplies as they needed; that Japanese vessels should assist American vessels driven ashore on the coasts of Japan, and that the crews of such vessels should be properly cared for at one of the two treaty ports; that shipwrecked and other American citizens in Japan should be as free as in other countries, within certain prescribed limits; that ships of the United States should be permitted to trade at the two treaty ports under temporary regulations prescribed by the Japanese, that American ships should use only the ports named, except under stress of weather, and that privileges granted to other nations thereafter must also be extended to the United States. Commodore Perry died in New York City on the 4th of March 1858.

A complete and readable account of this expedition, and its results, scientific as well as political, compiled from the journals and reports of Commodore Perry and his officers, was published by the United States government under the title, *Narrative of the Expedition of an American Squadron to the China Seas and Japan* (3 vols., Washington, 1856). The first volume of this work, containing Commodore Perry's narrative, was also published separately. A brief biography of Perry is included in Charles Morris's *Heroes of the Navy in America* (Philadelphia and London, 1907). See also William E. Griffis's *Matthew Calbraith Perry, a Typical American Naval Officer* (Boston, 1887).

PERRY, OLIVER HAZARD (1785–1819), American naval officer, was born at South Kingston, Rhode Island, on the 23rd of August 1785. He entered the navy as midshipman (1799) with his father, Christopher Raymond Perry (1761–1818), a captain in the navy, and saw service against the Barbary pirates. At the beginning of the war of 1812 he was in command of a flotilla at Newport, but was transferred (Feb. 1813) to the Lakes. He served with Commodore Chauncey, and then was sent from Lake Ontario to Lake Erie, where he took up the chief command at the end of March 1813. With the help of a strong detachment of officers and men from the Atlantic coast he equipped a squadron consisting of one brig, six fine schooners and one sloop. Other vessels were laid down at Presque Isle (now Erie), where he concentrated the Lake Erie fleet in July. When Captain Perry appeared off Amherstburg, where Captain Robert Heriot Barclay (d. 1837), the British commander, was lying with his squadron, he had a very marked superiority. Captain Barclay, after a hot engagement—the Battle of Lake Erie—in which Captain Perry's flagship the "Lawrence," a brig, was so severely shattered that he had to leave her, was completely defeated. Perry commanded the "Java" in the Mediterranean expedition of 1815–1816, and he died at Port of Spain in Trinidad on the 23rd of August 1819, of yellow fever contracted on the coast of Brazil.

See O. H. Lyman, *Commodore O. H. Perry and the War on the Lakes* (New York, 1905).

PERRY, a city and the county-seat of Noble county, Oklahoma, U.S.A., 30 m. N. by E. of Guthrie. Pop. (1900), 3351, of whom 399 were negroes. Perry is served by the Atchison Topeka & Santa Fé railway and by the St Louis & San Francisco system. It is the commercial centre of a large agricultural and stock-raising region, which produces cotton and grain. Perry was settled in 1889.

PERRY (from Fr. *poiré*, from *poire*, a pear), an alcoholic beverage, obtained by the fermentation of the juice of pears. The manufacture is in all essentials identical with that of CIDER (*q.v.*).

PERRYVILLE, a town of Boyle county, Kentucky, U.S.A., about 10 m. W. of Danville. Pop. (1900), 431. Here on the 8th of October 1863 General Braxton Bragg, in command of the Confederate army of the Mississippi of about 16,000 men, with which he had invaded Kentucky, faced about in his slow retreat across the state and gave battle to the Union army of the Ohio of about 40,000 (of whom only about 22,000 were actually engaged) commanded by Major-General Don Carlos Buell. Bragg's order to attack was disregarded by Major-General Leonidas Polk, who preferred adopting the "defensive-offensive" rather than engage all of Buell's force. Bragg himself came on the field about 10 a.m. and repeated his orders for an attack, but it was 2 p.m. before there was an actual engagement. Then after much delay on Polk's part the Confederate army joined battle with McCook's corps. The Confederate lines were broken and driven back through Perryville, where caissons, ammunition wagons and 140 officers and men were captured. Darkness had now come on, and in the night Bragg withdrew. His losses were reported as 510 killed, 2635 wounded and 251 missing. The Union loss was 845 killed, 2851 wounded and 515 captured or missing. The battle was drawn tactically, but strategically it was a Union victory and it virtually closed Bragg's unsuccessful Kentucky campaign, which is sometimes called the Perryville campaign.

PERSEPOLIS, an ancient city of Persia, situated some 40 m. N.E. of Shiraz, not far from where the small river Pulwar flows into the Kur (Kyrus). The site is marked by a large terrace with its east side leaning on Kuhi Rahmet ("the Mount of Grace"). The other three sides are formed by a retaining wall, varying in height with the slope of the ground from 14 to 41 ft.; on the west side a magnificent double stair, of very easy steps, leads to the top. On this terrace are the ruins of a number of colossal buildings, all constructed of dark-grey marble from the adjacent mountain. The stones were laid without mortar, and many of them are still *in situ*. Especially striking are the huge pillars, of which a number still stand erect. Several of the buildings were never finished. F. Stolze has shown that in some cases even the mason's rubbish has not been removed.[1] These ruins, for which the name *Kizil minare* or *Chihil menare* ("the forty columns or minarets"), can be traced back to the 13th century, are now known as *Takhti Jamshid* ("the throne of Jamshid"). That they represent the Persepolis captured and partly destroyed by Alexander the Great has been beyond dispute at least since the time of Pietro della Valle.[2]

Behind Takhti Jamshid are three sepulchres hewn out of the rock in the hillside, the façades, one of which is incomplete, being richly ornamented with reliefs. About 8 m. N.N.E., on the opposite side of the Pulwar, rises a perpendicular wall of rock, in which four similar tombs are cut, at a considerable height from the bottom of the valley. The modern Persians call this place *Nakshi Rustam* ("the picture of Rustam") from the Sassanian reliefs beneath the opening, which they take to be a representation of the mythical hero Rustam. That the

[1] Cf. J. Chardin, E. Kaempfer, C. Niebuhr and W. Ouseley. Niebuhr's drawings, though good, are, for the purposes of the architectural student, inferior to the great work of C. Texier, and still more to that of E. Flandin and P. Coste. Good sketches, chiefly after Flandin, are given by C. Kossowicz, *Inscriptiones palaeo-persicae* (St Petersburg, 1872). In addition to these we have the photographic plates in F. Stolze's *Persepolis* (2 vols., Berlin, 1882).

[2] *Lettera XV.* (ed. Brighton, 1843), ii. 246 seq.

occupants of these seven tombs were kings might be inferred from the sculptures, and one of those at Nakshi Rustam is expressly declared in its inscription to be the tomb of Darius Hystaspis, concerning whom Ctesias relates that his grave was in the face of a rock, and could only be reached by means of an apparatus of ropes. Ctesias mentions further, with regard to a number of Persian kings, either that their remains were brought "to the Persians," or that they died there.[1] Now we know that Cyrus was buried at Pasargadae (*q.v.*) and if there is any truth in the statement that the body of Cambyses was brought home "to the Persians" his burying-place must be sought somewhere beside that of his father. In order to identify the graves of Persepolis we must bear in mind that Ctesias assumes that it was the custom for a king to prepare his own tomb during his lifetime. Hence the kings buried at Nakshi Rustam are probably, besides Darius, Xerxes I., Artaxerxes I. and Darius II. Xerxes II., who reigned for a very short time, could scarcely have obtained so splendid a monument, and still less could the usurper Sogdianus (Secydianus). The two completed graves behind Takhti Jamshid would then belong to Artaxerxes II. and Artaxerxes III. The unfinished one is perhaps that of Arses, who reigned at the longest two years, or, if not his, then that of Darius III. (Codomannus), who is one of those whose bodies are said to have been brought "to the Persians"[2] (see ARCHITECTURE, fig. 12). Another small group of ruins in the same style is found at the village of Hājjīābād, on the Pulwar, a good hour's walk above Takhti Jamshid. These formed a single building, which was still intact 900 years ago, and was used as the mosque of the then existing city of Istakhr.

Since Cyrus was buried in Pasargadae, which moreover is mentioned in Ctesias as his own city,[3] and since, to judge from the inscriptions, the buildings of Persepolis commenced with Darius I., it was probably under this king, with whom the sceptre passed to a new branch of the royal house, that Persepolis became the capital[4] (see PERSIA: *Ancient History*, V. 2) of Persia proper. As a residence, however, for the rulers of the empire, a remote place in a difficult alpine region was far from convenient, and the real capitals were Susa, Babylon and Ecbatana. This accounts for the fact that the Greeks were not acquainted with the city until it was taken and plundered by Alexander the Great. Ctesias must certainly have known of it, and it is possible that he may have named it simply Πέρσαι, after the people, as is undoubtedly done by certain writers of a somewhat later date.[5] But whether the city really bore the name of the people and the country is another question. And it is extremely hazardous to assume, with Sir H. Rawlinson and J. Oppert, that the words *anā Pārsā*, "in this Persia," which occur in an inscription on the gateway built by Xerxes (D. l. 14), signify "in this *city* of Pārsā," and consequently prove that the name of the city is identical with the name of the country. The form Persepolis (with a play on πέρσις, destruction) appears first in Cleitarchus, one of the earliest, but unfortunately one of the most imaginative annalists of the exploits of Alexander.

It has been universally admitted that "the palaces" or "the palace" (τὰ βασίλεια) burned down by Alexander are those now in ruins at Takhti Jamshid. From Stolze's investigations it appears that at least one of these, the castle built by Xerxes, bears evident traces of having been destroyed by fire. The locality described by Diodorus after Cleitarchus corresponds in important particulars with Takhti Jamshid, for example, in being supported by the mountain on the east.[6] There is, however, one formidable difficulty. Diodorus says that the rock at the back of the palace containing the royal sepulchres is so steep that the bodies could be raised to their last resting-place only by mechanical appliances. This is not true of the graves behind Takhti Jamshid, to which, as F. Stolze expressly observes, one can easily ride up; on the other hand, it is strictly true of the graves at Nakshi Rustam. Stolze accordingly started the theory that the royal castle of Persepolis stood close by Nakshi Rustam, and has sunk in course of time to shapeless heaps of earth, under which the remains may be concealed. The vast ruins, however, of Takhti Jamshid, and the terrace constructed with so much labour, can hardly be anything else than the ruins of palaces; as for temples, the Persians had no such thing, at least in the time of Darius and Xerxes. Moreover, Persian tradition at a very remote period knew of only three architectural wonders in that region, which it attributed to the fabulous queen Humāi (Khumāi)—the grave of Cyrus at Murgah, the building at Hājjīābād, and those on the great terrace.[7] It is safest therefore to identify these last with the royal palaces destroyed by Alexander. Cleitarchus, who can scarcely have visited the place himself, with his usual recklessness of statement, confounded the tombs behind the palaces with those of Nakshi Rustam; indeed he appears to imagine that all the royal sepulchres were at the same place.

In 316 B.C. Persepolis was still the capital of Persis as a province of the great Macedonian Empire (see Diod. xix. 21 seq., 46; probably after Hieronymus of Cardia, who was living about 316). The city must have gradually declined in the course of time; but the ruins of the Achaemenidae remained as a witness to its ancient glory. It is probable that the principal town of the country, or at least of the district, was always in this neighbourhood. About A.D. 200 we find there the city Istakhr (properly *Stakhr*) as the seat of the local governors. There the foundations of the second great Persian Empire were laid, and Istakhr acquired special importance as the centre of priestly wisdom and orthodoxy. The Sassanian kings have covered the face of the rocks in this neighbourhood, and in part even the Achaemenian ruins, with their sculptures and inscriptions, and must themselves have built largely here, although never on the same scale of magnificence as their ancient predecessors. The Romans knew as little about Istakhr as the Greeks had done about Persepolis—and this in spite of the fact that for four hundred years the Sassanians maintained relations, friendly or hostile, with the empire.

At the time of the Arabian conquest Istakhr offered a desperate resistance, but the city was still a place of considerable importance in the 1st century of Islam (see CALIPHATE), although its greatness was speedily eclipsed by the new metropolis Shiraz. In the 10th century Istakhr had become an utterly insignificant place, as may be seen from the descriptions of Istakhri, a native (*c.* 950), and of Mukaddasi (*c.* 985). During the following centuries Istakhr gradually declined, until, as a *city*, it ceased to exist. This fruitful region, however, was covered with villages till the frightful devastations of the 18th century; and even now it is, comparatively speaking, well cultivated. The "castle of Istakhr" played a conspicuous part several times during the Mahommedan period as a strong fortress. It was the middlemost and the highest of the three steep crags which rise from the valley of the Kur, at some distance to the west or north-west of Nakshi Rustam. We learn from Oriental writers that one of the Buyid (Buwaihid) sultans in the 10th century of the Flight constructed the great cisterns, which may yet be seen, and have been visited, amongst others, by James Morier and E. Flandin. W. Ouseley points out that this castle was still used in the 16th century, at least as a state prison. But when Pietro della Valle was there in 1621 it was already in ruins.

[1] This statement is not made in Ctesias (or rather in the extracts of Photius) about Darius II., which is probably accidental; in the case of Sogdianus, who as a usurper was not deemed worthy of honourable burial, there is good reason for the omission.

[2] Arrian iii. 22, 1.

[3] Cf. also in particular Plutarch, *Artax.* iii., where Pasargadae is distinctly looked on as the sacred cradle of the dynasty.

[4] The story of Aelian (*H. A.* i. 59), who makes Cyrus build his royal palace in Persepolis, deserves no attention.

[5] So Arrian (iii. 18, 1, 10), or rather his best authority, King Ptolemy. So, again, the Babylonian Berossus, shortly after Alexander. See Clemens Alex., *Admon. ad gentes*, c. 5, where, with Georg Hoffmann (*Pers. Märtyrer*, 137), καὶ is to be inserted before Πέρσαις, and this to be understood as the name of the metropolis.

[6] The name of this mountain too, βασιλικὸν ὄρος, is identical with *Shāhkūh*, which is at least tolerably well established by W. Ouseley (ii. 417) as a synonym of *Kūhi rahmat*.

[7] See especially Hamza Isp. 38; Ṭabarī, i. 690, 816 (cf. T. Nöldeke, *Geschichte der Perser . . . aus . . . Ṭabari*, p. 8). The ruins at Takhti Jamshid are alluded to as the work of Humāi, in connexion with an event which occurred shortly after A.D. 200.

(Th. N.; A. H. S.)

PERSEUS, in Greek legend, son of Danaë and Zeus. When Perseus was grown to manhood Polydectes, king of Seriphus, cast his eye on Danaë; and, in order to rid himself of the son, exacted of him a promise that he would bring him the head of the Gorgon Medusa. The Gorgons dwelt with their sisters the Graeae (the grey women) by the great ocean, far away in the west. Guided by Hermes and Athena, Perseus came to the Graeae. They were three hags, with but one eye and one tooth between them. Perseus stole the eye and the tooth, and would not restore them till the Graeae had guided him to the Nymphs, from whom he received the winged sandals, a wallet (κίβισις, resembling a gamekeeper's bag) and the helmet of Hades, which rendered him invisible. Thus equipped and armed by Hermes with a sharp sword like a sickle, he came upon the Gorgons as they slept, and cut off Medusa's head, while with averted eyes he looked at her reflection which Athena showed him in the mirror of her shield. Perseus put the Gorgon's head in his wallet and fled, pursued by Medusa's sisters, to Ethiopia, where he delivered and married Andromeda (*q.v.*). With her he returned to Seriphus in time to rescue his mother and Dictys from Polydectes, whom he turned to stone with all his court by showing them the Gorgon's head. The island itself was turned to stone, and the very frogs of Seriphus (so ran the proverb) were dumb (Aelian, *Nat. anim.* iii. 37). Perseus then gave the head of Medusa to Athena, and, with Danaë and Andromeda, hastened to Argos to see his grandfather, Acrisius, once more. But before his arrival Acrisius, fearing the oracle, had fled to Larissa in Thessaly. Thither Perseus followed him, and at some funeral games held in honour of the king of that country unwittingly slew his grandfather by the throw of a quoit, which struck him on the foot. Ashamed to return to Argos, Perseus gave his kingdom to Megapenthes (Acrisius's nephew), and received from him Tiryns in exchange. There he reigned and founded Mideia and Mycenae, and became the ancestor of the Persides, amongst whom were Eurystheus and Heracles.

The legend of Perseus was localized in various places. Italy claimed that the chest containing Danaë and Perseus drifted ashore on the Italian coast (Virgil, *Aen.* vii. 372, 410). The Persian kings were said to have been descended from Perses a son of Perseus, and, according to Pausanias of Damascus,[1] he taught the Persians to worship fire, and founded the Magian priesthood. His cult was transferred to the kings of Pontus, for on coins of Amisus he is represented with the features of Mithradates Eupator. Like Andromeda, Hesione, the daughter of Laomedon, king of Troy, was rescued by Heracles from a sea-monster, and both stories have been interpreted of the sun slaying the darkness, Andromeda and Hesione being the moon, which the darkness is about to devour. In one version of the story of Hesione, Heracles is said to have spent three days, like Jonah, in the belly of the beast, and it is noteworthy that the Greek representations of Andromeda's monster were the models for Jonah's fish in early Christian art. Its bones and Andromeda's chains were shown on a rock at Joppa. Perseus appears on coins of Pontus and Cappadocia, and of Tarsus in Cilicia, which he was said to have founded. The legend of St George was influenced by the traditions current regarding Perseus in Syria and Asia Minor.

For the slaying of the Medusa, see F. H. Knatz, *Quomodo Persei fabulam artifices graeci et romani tractaverint* (1893); and, on the whole story, E. S. Hartland, *The Legend of Perseus* (1894–1896).

PERSEUS, in astronomy, a constellation of the northern hemisphere, called after the Greek legendary hero, it is mentioned by Eudoxus (4th century B.C.) and Aratus (3rd century B.C.); Ptolemy and Tycho Brahe catalogued 29 stars, Hevelius 46. The most important member of this constellation is *β Persei* or Algol (*q.v.*), a famous variable star. *θ Persei* is a triple star, composed of one 4th magnitude star and two of the 10th magnitude; *ρ Persei* is an irregular variable, with a range in magnitude of 3·4 to 4·1. *Nova Persei* is a "new" star discovered in 1887 and subsequently recognized on Harvard plates by Mrs Fleming in 1895; another new star was discovered by Anderson on the 21st of February 1901, which, after increasing in magnitude, gradually became fainter and ultimately disappeared. There is a nebula surrounding *Nova Persei* (1901) which was photographed at Yerkes observatory in September 1901; a pair of star clusters, appearing as a bright patch in the Milky Way; and the meteoric swarm named the Perseids, which appear in August and have their radiant in Perseus. (See Meteor.)

PERSEUS OF MACEDONIA (b. *c.* 212 B.C.), the last king of Macedonia, eldest son of Philip V. He had his brother Demetrius killed, and thus cleared his way to the throne in 179. War broke out with Rome in 171 B.C. when P. Licinius Crassus was sent to attack him. Perseus defeated Crassus at Callinicus in Thessaly, but in 168 he was annihilated at Pydna by L. Aemilius Paulus. He was led in triumph through Rome, and died in captivity at Alba Fucens. (See Macedonia.)

PERSHORE, a market town in the Evesham parliamentary division of Worcestershire, England, 113 m. W.N.W. of London and 7 S.E. of Worcester by the Great Western railway. Pop. (1901), 3348. The station is 1½ m. from the town. Market gardening and fruit-growing (especially plums) are carried on and agricultural implements are manufactured. The churches of the two parishes of Holy Cross and St Andrew face one another across a road. Holy Cross is a remnant of a mitred abbey of Benedictines, said to have been founded about 970 by King Edgar, on the site of a Mercian religious settlement. There remain only the fine Early English choir, with Decorated additions, the Norman south transept and the majestic Decorated tower; while slight fragments of a Norman nave are seen.

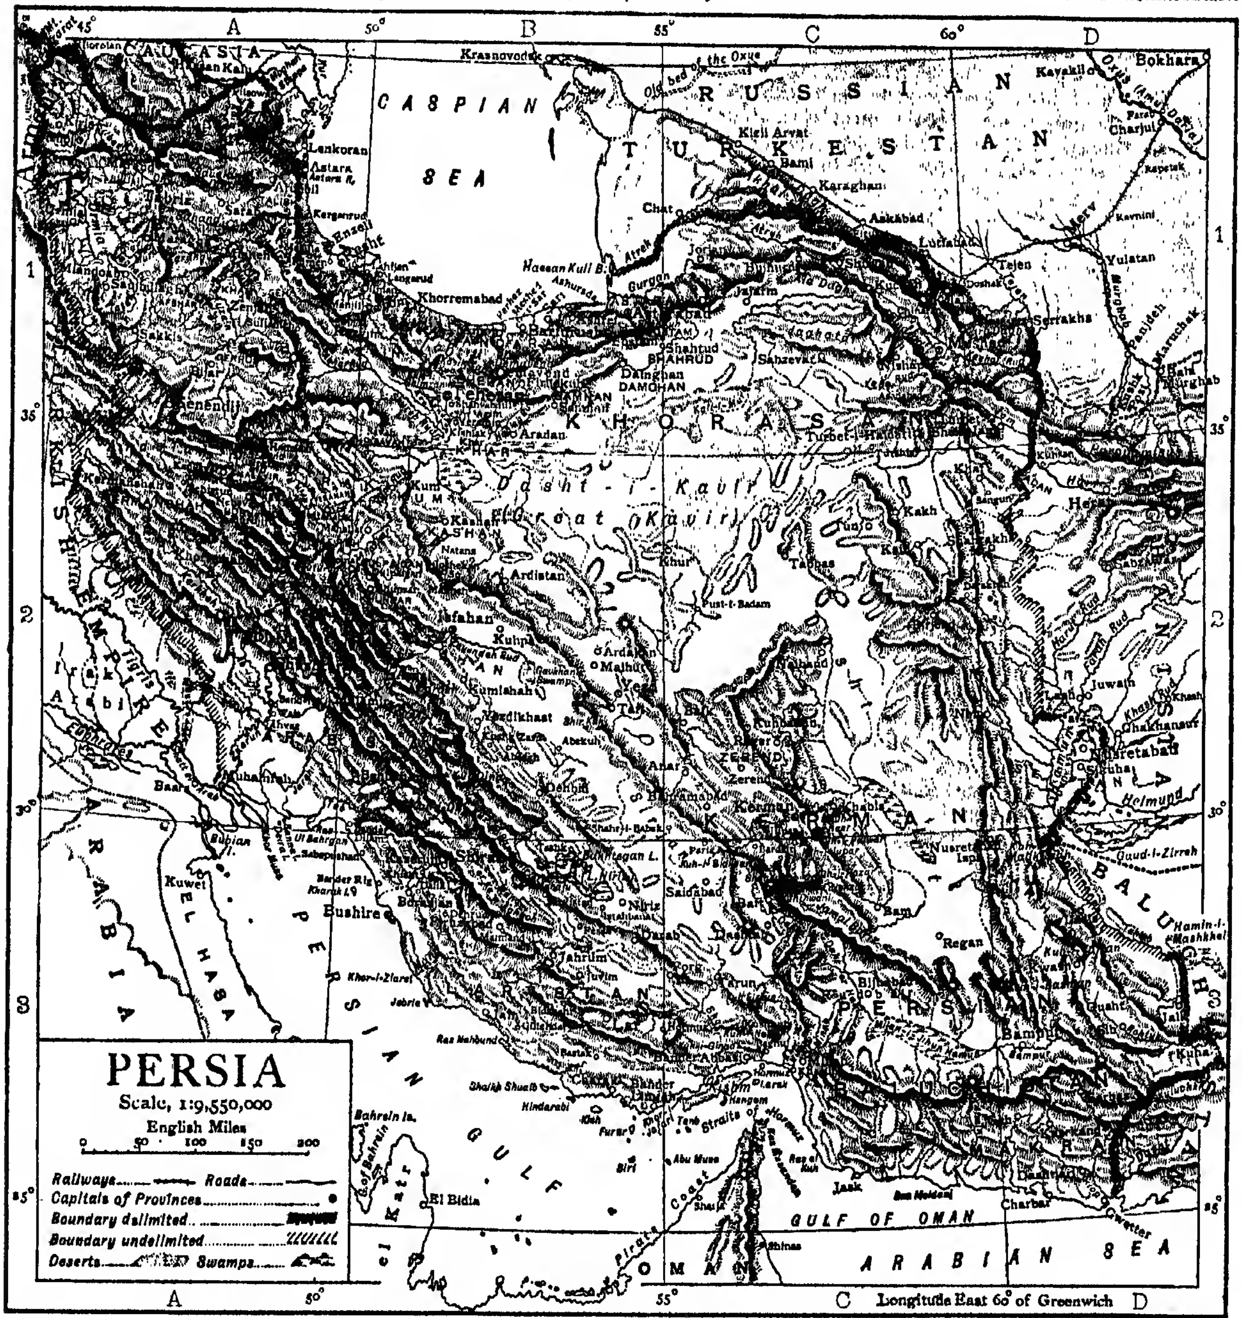
PERSIA, a kingdom of western Asia, bounded on the N. by the Caspian Sea and the Russian Transcaucasian and Transcaspian territories, on the E. by Afghanistan and Baluchistan, on the S. by the Arabian Sea and the Persian Gulf, and on the W. by Turkish territory. Long before the Christian era the satrapies of Darius comprehended roughly an immense range of territory, from the Mediterranean to the Indus and from the Caucasian chain and Jaxartes to the Persian Gulf and Arabian Ocean. In the 17th and 18th centuries A.D. the conquests of 'Abbas and Nadir kept up these boundaries more or less on the east, but failed to secure them on the west, and were limited to the Caucasus and Oxus on the north. Persia of the present day is not only, in the matter of geographical definition, far from the vast empire of Sacred Writ and remote history, but it is not even the less extensive dominion of the Safawi kings and Nadir Shah. It may be said, however, to comprise now quite as much settled and consolidated territory as at any period of its political existence of which we can speak with authority.

Boundaries.—The region of Ararat presents a good starting point for the definition of the western and northern frontiers of Persia. A line 20 m. in length from a point on the river Aras, in 39° 45′ N. and 44° 40′ E. to Mt Ararat, in a south-westerly direction, divides Persia from Russia. Southwards from Mt Ararat the Perso-Turkish frontier extends about 700 m. to the mouth of the Shatt el Arab in the Persian Gulf in 30° N. and 48° 40′ E., but is undefined with the exception of the western boundary of the little district of Kotur. A mixed commission was appointed in 1843 for the settlement of the Perso-Turkish frontier. The labours of this commission resulted in the Erzerum treaty of 1847, by which both powers abandoned some lands and agreed to appoint commissioners to define the frontier. The commissioners met in 1849, 1850 and 1851 at Bagdad and Muhamrah without arriving at any result. In 1851 Lord Palmerston proposed that the general line of frontier should be traced by the agents of Turkey and Persia at Constantinople, assisted by the

Western Frontier.

[1] Author of a history of Antioch; he is quoted by John Malalas, *Chronographia*, pp. 37–38, ed. Bonn (1831). Nothing further is known of him (see C. W. Müller, *Fragmenta historicorum graecorum*, iv. 467).

commissioners, in conformity with the treaty of Erzerum, leaving doubtful localities to be settled in future. The Russian government agreed to this proposal, and the work of surveying the country from Mt Ararat to the Persian Gulf was then undertaken. When this was done the preparation of a map, embracing territory 700 m. in length by 20 to 40 m. broad, was put in hand, and this work lasted from November 1857 till March 1865, when the Porte was informed in May of that year that "in the opinion of the mediating Powers, the future line of boundary between the respective dominions of the sultan and the shah was to be found within the limits traced on the map; that the two Mahommedan governments should themselves mark out the line; and that in the event of any differences arising between them in regard to any particular locality, the points in dispute should be referred to the decision of the governments of England and Russia." This boundary has remained unsettled, and disputes have frequently arisen between the Turkish and Persian governments with regard to their respective claims to land (Hertslet, *Persian Treaties*). In the autumn of 1907 Turkish troops occupied not only "doubtful localities" but also adjoining lands which were indisputably Persian territory. The want of a determined line of demarcation between the two countries may have political advantages, but is inconvenient to the geographer and most unfavourable to the cause of order and good government.



From the point on the Aras River 20 m. north-east of Mt Ararat, the river forms the northern boundary down to 48° E. The frontier line then runs about 35 m. in a south-easterly direction through the Moghan steppe to Pilsowar on the Bulgharu River and then south with a bend to the west to the Astara River and the port of Astara in 38° 27′ N. and 48° 53′ E. From Astara eastwards the boundary

Northern Frontier.

is formed by the shore of the Caspian until it touches the Bay of Hassan Kuli north of Astarabad. East of the Caspian Sea and beginning at Hassan Kuli Bay the river Atrek serves as the frontier as far as Chat. It then extends east and south-east to Serrakhs on the Tejen River in 36° 40′ N. and 61° 20′ E. The distance from Mt Ararat to Serrakhs in a straight line is about 930 m. The frontier from Mt Ararat to Astara was defined by the treaty of Turkmanchai (Feb. 22, 1828), and a convention of the 8th of July 1893. The frontier east of the Caspian was defined by the Akhal-Khorasan Boundary Convention of the 21st of December 1881 and the frontier convention of the 8th of July 1893.

Eastern Frontier. The eastern frontier extends from Serrakhs to near Gwetter on the Arabian Sea in 25° N. and 61° 30′ E., a distance of about 800 m. From Serrakhs to near Kuhsan the boundary is formed by the Tejen River (called Hari Rud, or river of Herat, in its upper course); it then runs almost due south to the border of Seistan in 31° N., and then through Seistan follows the line fixed by Sir Frederick Goldsmid's and Sir Henry McMahon's commissions in 1872 and 1903–1905 to Kuh i Malik Siah. From this point to the sea the frontier separates Persian territory from British Baluchistan and runs south-east to Kuhak and then south-west to Gwetter. This last section was determined by Sir Frederick Goldsmid's commission in 1871.

Southern Frontier. The southern boundary is the coast-line of the Arabian Sea and the Persian Gulf from Gwetter to the mouth of the Shatt el Arab, a distance of about 870 m., comprised between 48° 40′ E. and 61° 30′ E. The islands situated close to the northern shore of the Persian Gulf are Persian territory; they are, from east to west, Hormuz (Ormus), Larak, Kishm, Hengam, Furur, Kish (Kais), Hindarabi, Shaikh-Shu'aib, Jebrin, Kharak, Kharaku (Khorgu).

Physical Geography.—Modern Persia occupies the western and larger half of the great Iranian plateau which, rising to a height of from 4000 to 8000 ft. between the valleys of the Indus and Tigris, covers more than a million square miles. Taking the Kuren Dagh or Kopet Dagh to form the northern scarp of this plateau east of the Caspian, we find a prolongation of it in the highlands north of the political frontier on the Aras, and even in the Caucasus itself. On the north-west Persia is united by the highlands of Armenia to the mountains of Asia Minor; on the north-west the Paropamisus and Hindu Kush connect it with the Himalayas. The lines of boundary on the western and eastern faces are to be traced amid high ranges of mountains broken here and there by deserts and valleys. These ranges lie for the most part north-east and south-east, as do those in the interior, with a marked exception between Teherān and Bujnurd, and in Baluchistan, where they lie rather north-east and south-west, or, in the latter case, sometimes east and west. The real lowlands are the tracts near the sea-coast belonging to the forest-clad provinces of the Caspian in the north and the shores of the Persian Gulf below Basra and elsewhere. The Persians have no special names for the great ranges. Mountains and valleys are known only by local names which frequently cover but a few miles. Even the name Elburz, which European geographers apply to the chains and ranges that extend for a length of over 500 m. from Azerbaijan in the west to Khorasan in the east, stands with the Persians only for the 60 or 70 m. of mountains north and north-east of Teherān, including the cone of Demavend. The great central range, which extends, almost unbroken, for nearly 800 m. from Azerbaijan in the north-west to Baluchistan in the south-east, may aptly be called the *Central Range*. It has many peaks 9000 to 10,000 ft. in height, and some of its summits rise to an elevation of 11,000 ft. and near Kermān of nearly 13,000 ft. (Kuh-i-Jupar). The valleys and plains west of the Central Range, as for instance those of Mahallat, Joshekan, Isfahan, Sirjan, have an elevation of 5000 to 6500 ft.; those within the range, as Jasp, Ardahal, So, Pariz, are about 1000 ft. higher; and those east of it slope from an elevation of 5000 to 6000 ft. down to the depressions of the central plateau which, east of Kum, are not more than 2000 ft. and east of Kermān 1500 to 1700 ft. above the sea-level. Some of the ranges west of the Central Range, which form the highlands of Kurdistan, Luristan, Bakhtiari and Fars, and are parallel to it, end near the Persian Gulf; others follow the Central Range, and take a direction to the east at some point between Kermān and the sea on the western frontier of Baluchistan. Some of these western ranges rise to considerable elevations; those forming the Turko-Persian frontier west of the lake of Urmia have peaks 11,000 ft. in height, while the Sahand, east of the lake and south of Tabriz, has an elevation of 12,000 ft. Farther south, the Takht-i-Bilkis, in the Afshar district, rises to 11,200 ft., the Elvend (ancient Orontes), near Hamadan, to 11,600. The Shuturun Kuh, south of Burujird, is over 11,000 ft. in height, the Shahan Kuh, Kuh-i-Gerra, Zardeh Kuh and Kuh-l-Karan (by some writers called Kuh-l-Rang), all in the Bakhtiari country west of Isfahan, are 12,800 to 13,000 ft. in height; and the Kuh-i-Dina (by some writers wrongly called Kuh-i-Dinar) has an elevation of over 14,000 ft. Still farther south, towards Kermān, there are several peaks (Bid-Khan, Lalehzar, Shah-Kuh, Jamal Bariz, &c.) which rise to an elevation of 13,000 ft. or more, and the Kuh-i-Hazar, south of Kermān, is 14,700 ft. in height. Beginning near Ardebil in Azerbaijan, where the cone of Savelan rises to an elevation of 15,792 ft. (Russian trigonometrical survey), and ending in Khorasan, the great Elburz range presents on its southern, or inward, face a more or less abrupt scarp rising above immense gravel slopes, and reaches in some of its summits a height of nearly 13,000 ft.; and the peak of Demavend, north-west of Teherān, has a height of at least 18,000 ft. There are several important ranges in Khorasan, and one of them, the Binalud, west of Meshed and north of Nishapur, has several peaks of 11,000 to 12,000 ft. in height. In south-eastern Persia the Kuh-i-Basman, a dormant volcano, 11,000 to 12,000 ft. in height, in the Basman district, and the Kuh-i-Taftan, *i.e.* the hot or burning mountain (also called Kuh-i-Nushadar from the "sal ammoniac," *nushadar*, found on its slopes), an active triple-peaked volcano in the Sarhad district and 12,681 ft. in height (Captain Jennings), are notable features.

Rivers. Taking the area of Persia at 628,000 sq. m. the drainage may thus be distributed: (1) into the Arabian Sea and Persian Gulf, 135,000 sq. m.; (2) into the Caspian, 100,000; (3) into the Seistan depression, 43,000; (4) into the Urmia Lake, 20,000; (5) into the interior of Persia, 330,000. The first district comprises most of the south-western provinces and the whole of the coast region as far east as Gwetter; the second relates to the tracts west, south and east of the southern part of the Caspian Sea. The tracts south of the Caspian are not more than 20 to 50 m. wide; those on the west widen out to a depth of 250 m., meeting the watershed of the Tigris on the one side and that of the Euphrates and Lake Van on the other, and embracing between the two the basin of Lake Urmia. On the east the watershed of the Caspian gradually increases in breadth, the foot of the scarp extending considerably to the north of the south-eastern angle of that sea, three degrees east of which it turns to the south-east, parallel to the axis of the Kopet Dagh. The third drainage area comprises Persian Seistan with part of the Helmund (Hilmend) basin and a considerable tract adjoining it on the west. The fourth is a comparatively small area on the western frontier containing the basin of Lake Urmia, shut off from the rest of the inland drainage, and the fifth area takes in a part of Baluchistan, most of Kermān, a part of Fars, all Yezd, Isfahan, Kashan, Kum, Irak, Khamseh, Kazvin, Teherān, Samnan, Damghan, Shahrud, Khorasan and the central desert regions.

Four rivers belonging essentially to Persia, in reference to the Caspian watershed, are the Seafid Rud or Kizil Uzain on the south-west, the Herhaz on the south and the Gurgan and Atrek at the south-eastern corner of that inland sea. The Seafid Rud rises in Persian Kurdistan in about 35° 50′ N. and 46° 45′ E., a few miles from Senendij. It has a very tortuous course of nearly 500 m., for the distance from its source to the Caspian, 57 m. east of Resht, is only 210 m. in a straight line. The Kizil Uzain takes up some important affluents and is called Seafid Rud from the point where it breaks through the Elburz to the sea, a distance of 70 m. It drains 25,000 to 30,000 sq. m. of the country. The Herhaz, though not important in length of course or drainage, also, like the Seafid Rud, breaks through the Elburz range from the inner southern scarp to the north. It rises on the slopes of the Kasil Kuh, a peak 12,000 ft. in height within the Elburz, and about 25 m. north of Teherān, flows easterly through the Lar plateau, where it is known as the Lar River, and takes up several affluents; turns to the north-east at the foot of Demavend, leaving that mountain to the left, and flows due north past Amol to the Caspian. Its length is about 120 m. The Gurgan rises on the Armutlu plateau in Khorasan east of Astarabad, and enters the Caspian in 37° 4′ N., north-west of Astarabad, after a course of about 200 m. The Atrek rises a few miles from Kuchan and enters the Caspian at the Bay of Hassan Kuli in 37° 21′ N., after a course of about 300 m. From the sea to the Russian frontier post of Chat the river forms the frontier between Persia and the Russian Transcaspian region.

The drainage of the rivers which have no outlet to the sea and form inland lakes and swamps (*kavir*) may be estimated at 350,000 sq. m., including the drainage of Lake Urmia, which is about 20,000 sq. m. Fourteen rivers flow into the lake: the Aji Chai, Safi Chai, Murdi Chai and Jaghatu from the east, the Tatau (Tatava) from the south, and nine smaller rivers from the west. During heavy rains and when the snows on the hills melt, thousands of streams flow from all directions into the innumerable depressions of inner Persia, or help to swell the perennial rivers which have no outlet to the sea. These latter are few in number, and some of them barely suffice for purposes of agricultural irrigation, and in summer dwindle down to small rills. The perennial streams which help to form the kavirs (salt swamps) east of Kum and Kashan are the Hableh-rud, rising east of Demavend, the Jajrud,

rising north of Teherân, the Kend and Kerej rivers, rising north-west of Teherân, the Shureh-rud (also called Abhar-rud), rising near Sultanieh on the road between Kazvin and Tabriz, and the Kara-su, which rises near Hamadan and is joined by the Zarin-rud (also known as Do-ab), the Reza Chai (also called Mazdakan-rud), the Jehrud River and the Kum-rud. The river of Isfaban, Zendeh-rud, *i.e.* "the great river" (from Persian *zendeh* [Pehlevi, *zendeh*], great), but now generally known as Zayendeh-rud, *i.e.* "the life-giving river," flows into the Gavkhani or Gavkhaneh swamp, east of Isfahan. In Fars the Kur with its affluents forms the lake of Bakhtegan (also known as Lake of Niriz), and in its lower course, is generally called Bandamir (made famous by Thomas Moore) from the band (dam) constructed by the Amir (prince) Asad-ed-dowleh in the 10th century. ("Note on the Kur River in Fars," *Proc. Royal Geog. Soc.*, London, 1891.) The rivers flowing into the Persian Gulf and Arabian Sea diminish in importance from west to east. There are first the Diyala and Kerkheh flowing into the Tigris from the hills of Kurdistan; the Ab i Diz and Karun which unite below Shushter, and reach the Shatt el Arab at Muhamrah; and the Jarahi and Tab, which with the Karun form "the delta of Persian Arabistan, the most extensive and fertile plain in Persia." There are many streams which though fordable at most seasons (some of them are often quite dry) are unfordable during the rains. Two of these may be mentioned here, viz. the Mand and the Minab, which St John (*loc. cit.* p. 9) considered as being "of far more importance than the maps would lead the observer to suppose." The former, after a run of over 300 m. from its sources in the hills west of Shiraz, debouches at Khor-i-Ziaret about 60 m. south of Bushire. It is mentioned by the old Arab and Persian geographers as the Sitakan (in some MSS. misspelt Sakkan), and is the Sitakos of Arrian and the Sitioganus of Pliny. In its upper course it is now known as the Kara-aghach (Wych-elm) River (cf. "Notes on the River Maud in Southern Persia," *Royal Geog. Soc.*, London, December 1883). The Minah has two outlets into the Persian Gulf, one the Khor-i-Minab, a salt-water creek into which the river overflows during the rains, about 30 m. east of Bander Abbasi, the other the true Minah, at Khagun, some miles south of the creek. It rises in the hills about 100 m. north of Bander Abbasi, and has a considerable drainage. Its bed near the town of Minab (15 m. from the coast) is nearly a mile in width, and during the rains the water covers the whole bed, rendering it quite unfordable. During ordinary weather, in March 1884, the water flowing past the town was 100 yds. in width and 2 ft. deep (Preece, *Proc. Royal Geog. Soc.*, January 1885). In ordinary seasons very little water of the river runs into its original bed, being diverted into canals, &c. The creek, the Anamis of Nearchus, is navigable nearly all through the year as far as Shahbander, the custom-house, about 7 m. inland, for vessels o· 20 tons burden.

Desert. "The great desert region of Persia," writes Le Strange (*Lands of the Eastern Caliphate*, 1905), "stretches right across the high plateau of Irân going from north-west to south-east, and dividing the fertile provinces of the land into two groups; for the desert is continuous from the southern base of the Elburz mountains, that to the north overlook the Caspian, to the arid ranges of Makrân, which border the Persian Gulf. Thus it measures nearly 800 m. in length, but the breadth varies considerably; for in shape this immense area of drought is somewhat that of an hour-glass with a narrow neck, measuring only some 100 m. across, dividing Kermân from Seistân, while both north and south of this the breadth expands and in places reaches to over 200 m. At the present day the desert, as a whole, is known as the Lût or Dasht-i-Lût; the saline swamps and the dry salt area being more particularly known as the Dasbt-i-Kavîr, the term Kavîr being also occasionally applied to the desert as a whole."

A three-wire telegraph line on iron posts, completed in March 1907, passes through this region, and it is the unenviable lot of some Englishmen stationed at Bam and Nusretabad Ispi (Isbidh of mediaeval Arab geographers) on the confines of the desert regularly to inspect and test it. Of the northerly Great Kavir Dr Tietze thought that it was composed of a complex of isolated salt swamps separated by sand-dunes, low ridges of limestone and gypsum, perhaps also by volcanic rocks (*Jahrbuch k. k. geolog. Reichsanstalt*, Vienna, 1877). Dr Sven Hedin explored the northern part of the Great Desert in 1906. (A. H. S.)

Geology.—Persia consists of a central region covered by Quaternary deposits and bordered on the north, west and south by a raised rim composed of older rocks. These older rocks also form the isolated ranges which rise through the Quaternary deposits of the central area.

In northern Persia the rocks of the elevated rim are thrown into folds which form a curve round the southern shore of the Caspian. The mountain ranges of Khorasan show the western portion of a second curve of folding which is probably continued into the Hindu Kush. In the western rim of Persia the folds run from north-west to south-east, and in the south these folds appear to curve gradually eastward, following the trend of the coast. The folds in the central Persian chains run from north-west to south-east, parallel to those of the western border. It is seldom that the old crystalline rocks, which form the floor upon which the sedimentary strata were deposited, are exposed to view. Gneiss, granite and crystalline schist, however, are found in the Elburz and in some of the central ranges; and similar rocks form a large part of the Zagros. Some of these rocks are probably Archean, hut some appear to be metamorphosed sedimentary deposits of later date. The oldest beds in which fossils have yet been found belong to the Upper Devonian. They are well developed in the Elburz range, where they attain a thickness of some 9000 to 10,000 ft., and they have been found also in some of the central ranges and in the Bakhtiari Mountains. In the Elburz range the Devonian is succeeded by a series of limestones with *Productus*. The greater part of the series belongs to the Carboniferous, but the upper beds are probably of Permian age. The limestones are followed by sandstones and shales with occasional seams of coal. The plants which have been found in these beds indicate a Rhaetic or Liassic age. The Middle and Upper Jurassic form a considerable portion of the Elburz and have yielded marine fossils belonging to several different horizons. The Cretaceous system is very widely spread in Persia. It is one of the most conspicuous formations in the Zagros and in the central ranges, and probably forms a large part of the plateau, beneath the Quaternary deposits. The most prominent member of the series is a massive limestone containing *Hippurites* and belonging to the upper division of the system. The Tertiary deposits include nummulitic limestone (Eocene); a series of limestones, sandstones and conglomerates, with marine Miocene fossils; and red marls, clays and sandstones with rock-salt and gypsum, believed to belong to the Upper Miocene. In the Elburz there is a considerable deposit of palagonite tuff which appears to be of Oligocene age. The nummulitic limestone takes part in the formation of the mountain chains. The Miocene deposits generally lie at the foot of the chains, or in the valleys; but occasionally they are found at higher levels. Pliocene deposits cover a considerable area near the coast. Both in the Elburz range and near the Baluchistan frontier there are numerous recent volcanoes. Some of these seem to be extinct, but several continue to emit vapours and gases. Demavend in the Elburz and Kuh-i-Taftan on the Baluchistan frontier are among the best-known. (P. La.)

See W. K. Loftus, "On the Geology of Portions of the Turko-Persian Frontier, and of the Districts adjoining," *Quart. Journ. Geol. Soc.* vol. xi. pp. 247-344, pl. ix. (London, 1855); W. T. Blanford, *Eastern Persia*, vol. ii. (Zoology and Geology) (London, 1876); C. L. Griesbach, *Field-notes*: No. 5, to accompany a Geological Sketch Map of Afghanistan and North-Eastern Khorasan, Rec. Geol. Surv. India, xx. 93-103 (1887), with map; A. F. Stahl, "Zur Geologie von Persien," *Peterm. Mitt.*, Ergänzungsheft 122 (1897); J. de Morgan, *Mission scientifique en Perse*, vol. iii. (completed 1905, Paris). A summary hy H. Douvillé of the principal geological results of de Morgan's expedition will be found in *Bull. soc. géol. France*, 4th series, vol. iv. pp. 539-553.

Climate.—For the rainfall on the watershed of the Persian Gulf there are two places of observation, Bushire and Jask; at the first it is a little in excess of that of inner Persia, while at the second it is very much less. The rainfall on the Caspian watershed greatly exceeds that of inner Persia; at Astarabad and Ashurada, in the south-eastern corner of the Caspian, it is about 50 % more; and at Resht and Lenkoran, in the south-western corner, it is four and five times that of the adjoining districts across the ridges to the south. With the exception of the Caspian watershed and that of the Urmia basin, the country has probably in no part a yearly rainfall exceeding 13 or 14 in., and throughout the greater part of central and south-eastern Persia the yearly rainfall probably does not exceed 6 in. The following mean values of the rainfall at Teherân have been derived from observations taken by the writer during 1892–1907:—

Mean	Jan.	Feb.	Mar.	April.	May.	June.	Total for Year.
	in. 1·76	in. 1·17	in. 1·87	in. 1·41	in. ·50	in. ·06	9·86 in.
	July.	Aug.	Sept.	Oct.	Nov.	Dec.	
	in. ·05	in. ·05	in. ·06	in. ·32	in. 1·35	in. 1·26	

Good harvests depend on the rainfall from October to April, and on an amount of snow sufficient to cover the crops during frosts. During normal winters in Teherân and surrounding districts the rainfall amounts to 9 or 10 in., with 3 to 4 of snow, but in the winter 1898–1899 it was only 5½ in., with only 1 in. of snow; and in 1899–1900 the harvests were in consequence exceptionally bad, and large quantities of wheat and flour had to be brought from the provinces and even from Russia at high freights, causing the price of bread at Teherân to rise 200 %. The first table on p. 191 shows the mean annual rainfall in inches at fifteen stations in and near Persia.

The prevailing winds throughout Persia and the Persian Gulf are the north-west and south-east owing partly to the position of the Black Sea and Mediterranean and of the Arabian Sea, and partly

to the bearing of the axes of the great mountain chains. A dry and warm wind comes down from the snowy Elburz to Gilan in December and January, and much resembles the föhn of the Alps (Dr Tholozan, "Sur les vents du Nord de la Perse et sur le foehn du Guilan," *Comptes rendus*, Acad. d. Sciences, March 1882).

Observations for temperature have been taken for many years at the stations of the Indo-European Telegraph and for a few years at the British consulate in Meshed, and the monthly and annual means shown in the following table have been derived from the indications of maximum and minimum thermometers in degrees Fahrenheit.

Frequently when the temperature in the shade at Bushire is not more than 85° or 90°, and the great humidity of the air causes much bodily discomfort, life is almost pleasant 12 or 20 m. inland with a temperature of over 100°.

Fauna.—Mr W. T. Blanford has described with great care and minuteness the zoology of Persia. In company with Major St John, R.E., he made a large collection of the vertebrate fauna in a journey from Gwetter to Teherān in 1872. Having added to this a previous collection made by the same officer with the assistance of a native from Calcutta, he had before him the principal materials for his work. Before commencing his analysis he adverted to his predecessors in the same field, *i.e.* Gmelin (whose travels were published in 1774–1784), Olivier (1807), Pallas (1811), Ménétries (1832), Bélanger (1834), Eichwald (1834–1841), Aucher Éloy (1851), Loftus, Count Keyserling, Kokschy, Chesney, the Hon. C. Murray, De Filippi (1865), Hume (1873), and Professor Strauch of St Petersburg. All of these had, more or less, contributed something to the knowledge of the subject, whether as writers or as collectors, or in both capacities, and to all the due meed of credit was assigned. Blanford divided Persia into five zoological provinces: (1) the Persian plateau, or from the Kopet Dagh southwards to nearly 28° N. lat., including all Khorasan to the Perso-Afghan border, its western limit being indicated by a long line to the north-west from near Shiraz, taking in the whole upper country to the Russian frontier and the Elburz; (2) the provinces south and south-west of the Caspian; (3) a narrow strip of wooded country south-west of the Zagros range, from the Diyala River in Turkey in Asia to Shiraz; (4) the Persian side of the Shatt-el-Arab, and Aralictan, east of the Tigris; and (5) the shores of the Persian Gulf and Baluchistan. The fauna of the Persian plateau he described as "Palaearctic, with a great prevalence of desert forms; or, perhaps more correctly,

Very few hygrometrical observations have been taken, and only those of the British residency at Bushire are more or less trustworthy, and have been regularly registered for a number of years. In inner Persia the air is exceptionally dry, and in many districts polished steel may be exposed in the open during a great part of the year without becoming tarnished. Along the shores of the Caspian, particularly in Gilan and Mazandaran, and of the Persian Gulf from the mouth of the Shatt el Arab down to Bander Abbasi, the air during a great part of the year contains much moisture—dry- and wet-bulb thermometers at times indicating the same temperature—and at nights there are heavy falls of dew. In Gilan and Mazandaran the air contains much moisture up to considerable elevations and as far as 30 to 40 m. away from the sea; but along the Persian Gulf, where vegetation is very scanty, stations only a few miles away from the coast and not more than 20 or 30 ft. above the sea-level have a comparatively dry climate.

as being of the desert type with Palaearctic species in the more fertile regions." In the Caspian provinces he found the fauna, on the whole, Palaearctic also, "most of the animals being identical with those of south-eastern Europe." But some were essentially indigenous, and he observed "a singular character given to the fauna by the presence of certain Eastern forms, unknown in other parts of Persia, such as the tiger, a remarkable deer of the Indo-Malayan group, allied to *Cervus axis*, and a pit viper (*Halys*)." Including the oak-forests of Shiraz with the wooded slopes of the Zagros, he found in his third division that, however little known was the tract, it appeared to contain, like the second, "a Palaearctic fauna with a few peculiar species." As to Persian Mesopotamia, he considered its fauna to belong to the same Palaearctic region as Syria, but could scarcely speak with confidence on its characteristic forms. The fifth and last division, Baluchistan and the shores of the Persian Gulf, presented, however, in the animals common to the Persian highlands "for the most part desert types, whilst the characteristic Palaearctic species almost entirely disappear, their place being taken by Indian or Indo-African forms." The Persian Gulf Arab, though not equal to the pure Arabian, is a very serviceable animal, and has always a value in the Indian market. Among others the wandering Turkish tribes in Fars have the credit of possessing good steeds. The Turkoman horse of Khorasan and the Atak is a large, bony and clumsy-looking quadruped, with marvellous power and endurance. Colonel C. E. Stewart stated that the Khorasan camel is celebrated for its size and strength, that it has very long hair, and bears cold and exposure far better than the ordinary Arabian or Persian camel, and that, while the ordinary Persian camel only carries a load of some 320 ℔ and an Indian camel one of some 400 ℔, the Khorasan camel will carry from 600 to 700 ℔. The best animals, he notes, are a cross between the Bactrian or two-humped and the Arabian or one-humped camel. Sheep, goats, dogs and cats are good of their kind; but not all the last are the beautiful creatures which, bearing the name of the

country, have arrived at such distinction in Europe. Nor are these to be obtained, as supposed, at Angora in Asia Minor. Van or Isfahan is a more likely habitat. The cat at the first place, called by the Turks "Van kedisi," has a certain local reputation. Among the wild animals are the lion, tiger, leopard, lynx, brown bear, hyena, hog, badger, porcupine, pole-cat, weasel, marten, wolf, jackal, fox, hare, wild ass, wild sheep, wild cat, mountain-goat, gazelle and deer. The tiger is peculiar to the Caspian provinces. Lovett says they are plentiful in Astrabad; he measured two specimens, one 10 ft. 8 in., the other 8 ft. 10 in. from the tip of the nose to the end of the tail. Lynxes and bears were to be found in the same vicinity, and the wild pig was both numerous and destructive.

According to Blanford there are about four hundred known species of birds in Persia. The game birds have admirable representatives in the pheasant, "karkavul" (*Phasianus colchicus*, L.); snowcock or royal partridge, "kebk-i-dari" (*Tetraogallus Caspius*, Gmel.); black partridge, "durraj" (*Francolinus vulgaris*, Steph.); red-legged partridge, "kebk" (*Caccabis chukar*, Gray); sand-partridge or seesee, "tihu" (*Ammoperdix bonhami*, Gray); Indian grey partridge, "jirufti" (*Ortygornis ponticerianus*, Gmel.); quail, "belderjin" (*Coturnix communis*, Bonn.); sandgrouse, "siyah-sinch" (*Pterocles arenarius*, Pall.); bustard, "hubarch" (*Otis tetrax*, L. and *O. McQueenii*, Gray); woodcock, snipe, pigeon, many kinds of goose, duck, &c. The flamingo comes up from the south as far north as the neighbourhood of Teherān; the stork abounds. Poultry is good and plentiful. A large kind of fowl known as "Lari" (from the province Lar, in southern Persia) is said to be a descendant of fowls brought to Persia by the Portuguese in the 16th century.

The fish principally caught along the southern shore of the Caspian are the sturgeon, "sagmahi," dogfish (*Acipenser ruthenus* and *A. huso*); sheat-fish or silure, "simm," "summ" (*Silurus glanis*); salmon, "azad mahi" (*Salmo salar*); trout, "masch" (*Salmo trutta*); carp, "kupur" (*Cyprinus ballerus* and *C. carpio*); bream, "subulu" (*Abramis brama*); pike-perch, "mahi safid" (*Perca lucioperca* or *Lucioperca sandra*). There is also a herring which frequents only the southern half of the Caspian, not passing over the shallow part of the sea which extends from Baku eastwards. As it was first observed near the mouth of the river Kur it has been named *Clupea Kurensis*. Fish are scarce in inner Persia; salmon trout and mud-trout are plentiful in some of the mountain streams. Many underground canals are frequented by carp and roach. The silure has also been observed in some streams which flow into the Urmia lake, and in Kurdistan.

Flora.—In the provinces of Gilan, Mazandaran and Astarabad on the Caspian, from the shore to an altitude of about 3000 ft. on the northern slopes of the great mountain range which separates those provinces from the highlands of Persia, the flora is similar to that of Grisebach's "mediterranean region." At higher altitudes many forms of a more northern flora appear. As we approach inner Persia the flora rapidly makes place to "steppe vegetation" in the plains, while the mediterranean flora predominates in the hills. The steppe vegetation extends to the south to the outer range of the hills which separate inner Persia from the Persian Gulf and the Indian Ocean. Beyond this outer range and along the shore of the sea the flora is that of the "Sahara region," which extends eastwards to Sind.

Generally speaking, everywhere, excepting in the northern lowlands and in a few favoured spots in the hilly districts, the vegetation is scanty. In inner Persia the hills and plains are bare of trees, and steppe and desert predominate. The date-palm thrives well as far north as Tabbas in latitude 33° 36′ and at an altitude of 2000 ft., and in the south extensive date-groves, producing excellent fruit, exist at altitudes of 2000 to 5000 ft. The olive is cultivated at Rudbar south of Resht in Gilan, and a few isolated olive-trees have been observed in central and southern Persia.

Of fruits the variety is great, and nearly all the fruits of Europe are well represented. The common, yet excellent melons, water-melons, grapes, apricots, cherries, plums, apples, are within the reach of the poorest. Less common and picked fruits are expensive, particularly so when cost of transport has to be considered; for instance, a good orange costs 2d. or 3d. in Teherān, while in Mazandaran (only 100 m. distant), whence the oranges are brought, it costs ½d. Some fruits are famous and vie in excellence with any that European orchards produce; such are the peaches of Tabriz and Meshed, the sugar melons of Kashan and Isfahan, the apples of Demavend, pears of Natanz, figs of Kermānshāh, &c. The strawberry was brought to Persia about 1859, and is much cultivated in the gardens of Teherān and neighbourhood; the raspberry was introduced at about the same time, but is not much appreciated. Currants and gooseberries are now also grown. The common vegetables also are plentiful and cheap, but only a few, such as the broad-bean, egg-plant (*Solanum melongena*), onion, carrot, beetroot, black turnip, are appreciated by the natives, who generally do not take kindly to newly-introduced varieties. The potato, although successfully cultivated in Persia since about 1780, has not yet found favour, and the same may be said of the tomato, asparagus, celery and others. Flowers are abundant, but it is only since the beginning of Nasr ed din Shah's reign (1848), when European gardeners were employed in Persia, that they were rationally cultivated. Nearly all the European garden flowers, even the rarer ones, can now be seen not only in the parks and gardens of the rich and well-to-do but in many unpretentious courtyards with only a few square yards of surface.

Population.—In 1881 the present writer estimated the population of Persia at 7,653,600; 1,963,800 urban, 3,780,000 rural and 1,909,800 wandering ("Bevölkerung der Erde," p. 28; *Ency. Brit.* 9th ed. p. 628); and, allowing for an increase of about 1 % per annum the population for 1910 may be estimated at 10 millions. No statistics whatever being kept, nothing precise is known of the movement of the population. During the ninth decade of the 19th century many Persian subjects emigrated, and many Persian villages were deserted and fell to ruins; since then a small immigration has set in and new villages have been founded. Persians say that the females exceed the males by 10 to 20 %, but wherever the present writer has been able to obtain trustworthy information he found the excess to be less than 2 %. Of the deaths in any place the only check obtainable is from the public body-washers, but many corpses are buried without the aid of the *public* body-washers; and the population of the place not being accurately known, the number of deaths, however correct, is useless for statistical purposes. Medical men have stated that the number of deaths, in times when there are no epidemics, amounts to 19 or 20 per thousand, and the number of births to 25 to 40 per thousand.

The prices of the staple articles of food and all necessaries of life have risen considerably since 1880, and, particularly in the large cities, are now very high. As salaries and wages have not increased at the same rate, many of the upper classes and officials are not so well off as formerly. By dismissing their servants in order to reduce expenditure, they have thrown great numbers of men out of employment, while many labourers and workmen are living very poorly and often suffer want. Tradesmen are less affected, because they can sell the articles which they manufacture at values which are more in proportion with the increased prices of food. In 1880 a labourer earning 25 krans, or £1 sterling a month, could afford to keep a family; by 1908, in krans, he earned double what he did in 1880, but his wage, expressed in sterling, was the same, and wherever the prices of food have risen more than his wages he could not afford to keep a family. In many districts and cities the number of births is therefore reduced, while at the same time the mortality, in consequence of bad and often insufficient food, is considerably increased.

The description of the Persian character by C. J. Wills, in his *In the Land of the Lion and Sun* (1883), is still worth quoting:—

"The character of the Persian is that of an easy-going man with a wish to make things pleasant generally. He is hospitable, obliging, and specially well disposed to the foreigner. His home virtues are many: he is very kind and indulgent to his children and, as a son, his respect for both parents is excessive, developed in a greater degree to his father, in whose presence he will rarely sit, and whom he is in the habit of addressing and speaking of as 'master.' The full stream of his love and reverence is reserved for his mother; he never leaves her to starve, and her wishes are laws to him. The mother is always the most important member of the household, and the grandmother is treated with veneration. The presence of the mother-in-law is coveted by their sons-in-law, who look on them as the guardians of the virtue of their wives. The paternal uncle is a much nearer tie than with us; while men look on their first cousins on the father's side as their most natural wives.

"Black slaves and men-nurses or 'lallahs' are much respected; the 'dayah' or wet nurse is looked on as a second mother and usually provided for for life. Persians are very kind to their servants; a master will often be addressed by his servant as his father, and the servant will protect his master's property as he would his own. A servant is invariably spoken to as 'bacha' (child). The servants expect that their master will never allow them to be wronged. The slaves in Persia have a good time; well fed, well clothed, treated as spoiled children, given the lightest work, and often given in marriage to a favourite son or taken as 'segah' or concubine by the master himself, slaves have the certainty of a well-cared-for old age. They are looked on as confidential servants, are entrusted with large sums of money, and the conduct of the most important affairs; and seldom abuse their trust. The greatest punishment to an untrustworthy slave is to give him his liberty and let him earn his living. They vary in colour and value: the 'Habashi' or Abyssinian is the most valued; the Suhali or Somali, next in blackness, is next in price; the Bombassi, or coal-black negro of the interior, being of much less price, and usually only used as a cook. The prices of slaves in Shiraz are, a good Habashi girl of twelve to fourteen £40, a good Somali

same age, half as much; while a Bombassi is to be got for £14, being chosen merely for physical strength. They are never sold, save on importation, though at times they are given away. . . . I have never seen a Persian unkind to his own horse or his slave, and when overtaken by poverty he will first sell his shirt, *then* his slave.

"In commercial morality, a Persian merchant will compare not unfavourably with the European generally. . . . To the poor, Persians are unostentatiously generous; most of the rich have regular pensioners, old servants, or poor relations who live on their bounty; and though there are no workhouses, there are in ordinary times no deaths from starvation; and charity, though not organized, is general. . . . Procrastination is the attribute of all Persians, 'to-morrow' being ever the answer to any proposition, and the 'to-morrow' means indefinite delay. A great dislike is shown generally to a written contract binding the parties to a fixed date; and, as a rule, on breaking it the Persian always appeals for and expects delay and indefinite days of grace. . . .

"Persians are clean in their persons, washing themselves and their garments frequently. The Persian always makes the best of his appearance; he is very neat in his dress, and is particular as to the sit of his hat and the cut of his coat. All Persians are fond of animals, and do not treat them badly when their own property.

"Cruelty is not a Persian vice; torture and punishments of an unusual and painful nature being part of their judicial system. There are no vindictive punishments, such as a solitary confinement, penal servitude for long terms of years, &c. Seldom, indeed, is a man imprisoned more than twelve months, the rule being that there is a general jail delivery at the New Year. Royal clemency is frequently shown, often, perhaps, with want of judgment."

Costume.—The costume of the Persians may be shortly described as fitted to their active habits. The men invariably wear an unstarched shirt of cotton, sewn with white silk, often, particularly in the south of Persia, elaborately embroidered about the neck. It fastens in front by a flap, having two small buttons or knots at the left shoulder, and seldom comes below the hips. It has no collar, and the sleeves are loose. The lower orders often have it dyed blue; but the servant and upper classes always prefer a white shirt. Silk shirts are now seldom seen on men. Among the very religious during the mourning month ("Muharram") the shirt is at times dyed black. The "zir-jamah," or trousers,[1] are of cloth among the higher classes, particularly those of the military order, who affect a garment of a tightness approaching that worn by Europeans. The ordinary "zir-jamah" are of white, blue or red cotton, very loose, and are exactly similar to the pyjamas worn by Europeans in India. They are held up by a thin cord of red or green silk or cotton round the waist, and the labouring classes, when engaged in heavy or dirty work, or when running, generally tuck the end of these garments under the cord, which leaves their legs bare and free to the middle of the thigh. The amplitude of this part of his attire enables the Persian to sit without discomfort on his heels; chairs are only used by the rich, great or Europeanized. Over the shirt and "zir-jamah" comes the "arkhalik," generally of quilted chintz or print, a closely-fitting garment, collarless, with tight sleeves to the elbow, whence, to the wrist, are a number of little metal buttons, fastened in winter, but not in summer. Above this is the "kamarchin," a tunic of coloured calico, cloth, Kashmir or Kermān shawl, silk, satin or velvet (gold embroidered, or otherwise), according to the time of the year and the purse and position of the wearer. This, like the "arkhalik," is open in front, and shows the shirt. It sometimes has a small standing collar, and is double-breasted. It has a pocket-hole on either side, giving access to the pockets, which are always in the "arkhalik," where also is the breast-pocket in which watch, money, jewels and seals are kept. The length of the "kamarchin" denotes the class of the wearer. The military and official classes and the various servants wear it short, to the knee, while fops and sharpers wear it even shorter. Priests, merchants, villagers, especially about Shiraz, townsmen, shopkeepers, doctors and lawyers wear it very long, often nearly to the heels. Over the "kamarchin" is worn the "kulijah," or coat. This is, as a rule, cast off in summer, save on formal occasions, and is often borne by a servant, or carried over the shoulder by the owner. It is of cloth, shawl or camel-hair cloth, and is lined with silk or cloth, flannel or fur. It has, like the Turkish frockcoat, a very loose sleeve, with many plaits behind. It has lapels, as with us, and is trimmed with gold lace, shawl or fur, or is worn quite plain. It has a roll collar and false pockets.

Besides these garments there are others: the long "jubba," or cloth cloak, worn by "mirzas" (secretaries), government employés of high rank, as ministers, farmers of taxes, courtiers, physicians, priests; the "abba," or camel-hair cloak of the Arab, worn by travellers, priests and horsemen; the "pustin," or Afghan skin-cloak, used by travellers and the sick or aged; the "nimtan," or common sheepskin jacket, with short sleeves, used by shopkeepers and the lower class of servants, grooms, &c., in winter; the "yapanjah," or woollen Kurdish cloak, a kind of felt, having a shaggy side, of immense thickness, worn generally by shepherds, who use it as greatcoat, bed and bedding. There is also the felt coat of the villager, very warm and inexpensive, the cost being from 5 to 15 krans (a kran = 10d.). The "kamarband," or girdle, is also characteristic of class. It is made of muslin, shawl or cotton cloth among the priests, merchants, bazaar people, the secretary class and the more aged government employés. In it are carried, by literati and merchants, the pen-case and a roll of paper; its voluminous folds are used as pockets; by the bazaar people and villagers, porters and merchants' servants, a small sheath knife is struck in it; while by "farrashes," the carpet-spreader class, a large "khanjar," or curved dagger, with a heavy ivory handle, is carried. The headgear is very distinctive. The turban worn by priests is generally white, consisting of many yards of muslin. When the wearers are "saiyid" of the Prophet, a *green*[2] turban is worn, also a "kamarband" of *green* muslin, or shawl or cotton cloth. Merchants generally wear a turban of muslin embroidered in colours, or of a yellow pattern on straw-coloured muslin, or of calico, or shawl. The distinctive mark of the courtier, military, and upper servant class is the belt, generally of black varnished leather with a brass clasp; princes and courtiers often replace this clasp by a huge round ornament of cut stones. The "kulah," or hat, is of cloth or sheepskin on a frame of pasteboard. The fashions in hats change yearly. The Isfahan merchant and the Armenian at times wear the hat very tall. (The waist of the Persian is generally small, and he is very proud of his fine figure and broad shoulders.)

The hair is generally shaved at the crown, or the entire head is shaved, a "kakul," or long thin lock, being sometimes left, often 2 ft. long, from the middle of the crown. This is to enable the prophet Mahomet to draw up the believer into paradise. The lower orders generally have the hair over the temporal bone long, and brought in two long locks turning backwards behind the ear, termed "zulf"; the beaux and youths are constantly twisting and combing these. The rest of the head is shaven. Long hair, however, is going out of fashion in Persia, and the more civilized affect the cropped hair worn by Europeans, and even have a parting in it. The chin is never shaved, save by "beauty men," or "kashangs," though often clipped, while the moustache is usually left long. At forty a man generally lets his beard grow its full length, and cherishes it much; part of a Persian's religious exercises is the combing of his beard. Socks, knitted principally at Isfahan, are worn; they are only about 2 in. long in the leg. The rich, however, wear them longer. They are of white cotton in summer and coloured worsted in winter. Villagers only wear socks on state occasions. Shoes are of many patterns. The "urussi," or Russian shoe is the most common; next, the "kafsh" or slipper of various kinds. The heel is folded down and remains so. The priests wear a peculiar heavy shoe, with an ivory or wooden lining at the heel. Green shoes of shagreen are common at Isfahan. Blacking is unknown to Persians generally. Boots are only used by horsemen, and are then worn much too large for ease. Those worn by couriers often come up the thigh. With boots are worn "shalwars," or baggy riding breeches, very loose, and tied by a string at the ankle; a sort of kilt is worn by couriers. Pocket-handkerchiefs are seldom used, save by the rich or the Tcherānis. Most Persians wear a "shab kulah," or night hat, a loose baggy cap of shawl or quilted material, often embroidered by the ladies.

Arms are usually carried only by tribesmen. The natives of the south of Persia and servants carry a "kammah," or dirk. The soldiery, on or off duty, always carry one of these or their side-arms, sometimes both. They hack but never thrust with them. On the road the carrying of weapons is necessary.

The costume of the women has undergone considerable change in the last century. It is now, when carried to the extreme of fashion, highly indecent and must be very uncomfortable. The garment doing duty as a chemise is called a "pirahan"; it is, with the lower orders, of white or blue calico, and comes down to the middle of the thigh, leaving the leg nude. Among the upper classes it is frequently of silk. At Shiraz it is often of fine cotton, and elaborately ornamented with black embroidery. With the rich it is often of gauze, and much embroidered with gold thread, pearls, &c. The head is usually covered with a "char-kadd," or large square of embroidered silk or cotton, folded so as to display the corners, and fastened under the chin by a brooch. It is often of considerable value, being of Kashmir shawl, embroidered gauze, &c. A "jika," a jewelled feather-like ornament, is often worn at the side of the head, while the front hair, cut to a level with the mouth, is brought up in love-locks on either cheek. Beneath the "char-kadd" is generally a small kerchief of dark material, only the edge of which is visible. The ends of the "char-kadd" cover the shoulders, but the gauze "pirahan" is quite transparent. A profusion of jewelry is worn of the most solid description, none hollow; silver is worn only by the very poor, coral only by negresses. Necklaces and bracelets are much affected, and chains with scent-caskets attached, while the arms are covered with clanking glass bangles called "alangu," some twenty even of these being on one arm. Jewelled "bazubands," containing talismans, are often worn on the upper arm, while among the lower orders and south Persian or Arab women nose-rings are not uncommon, and bangles or anklets of beads,

[1] *Zir-jamah* are loose trousers and also drawers worn under the *shalvar*, or tight trousers.

[2] Green turbans are now rarely seen; the colour is generally dark blue, or black.

The face on important occasions is usually much painted, save by young ladies in the heyday of beauty. The colour is very freely applied, the cheeks being as much raddled as a clown's, and the neck smeared with white, while the eyelashes are marked round with "kuhl." This is supposed to be beneficial to the eyes, and almost every woman uses it. The eyebrows are widened and painted till they appear to meet, while sham moles or stars are painted on the chin and cheek; even spangles are stuck at times on the chin and forehead. Tattooing is common among the poor and in villages, and is seen among the upper classes. The hair, though generally hidden by the "char-kadd," is at times exposed and plaited into innumerable little tails of great length, while a coquettish little skull-cap of embroidery, or shawl, or coloured silk is worn. False hair is common. The Persian ladies' hair is very luxuriant and never cut; it is nearly always dyed red with henna, or with indigo to a blue-black tinge; it is naturally a glossy black. Fair hair is not esteemed. Blue eyes are not uncommon, but brown ones are the rule. A full-moon face is much admired, and a dark complexion termed "namak" (salt) is the highest native idea of beauty. Most Persian women are small, with tiny feet and hands. The figure is always lost after maternity, and no support of any kind is worn.

A very short jacket, of gay colour, quite open in front, having tight sleeves with many metal buttons, is usually worn in summer, and a lined outer coat in cold weather. In winter a pair of very short white cotton socks are used, and tiny slippers with a high heel; in summer in the house ladies go often barefoot. The rest of the costume is composed of the "tumbun" or "shalvar," short skirts of great width, held by a running string—the outer one being usually of silk, velvet, or Kashmir shawl, often trimmed with gold lace, or, among the poor, of loud-patterned chintz or print. Beneath are innumerable other garments of the same shape, varying in texture from silk and satin to print. The whole is very short, among the women of fashion extending only to the thigh. In winter an over-mantle like the "kulijah," or coat of the man, with short sleeves, lined and trimmed with furs, is worn. Leg-coverings are now being introduced. In ancient days the Persian ladies always wore them, as may be seen by the pictures in the South Kensington Museum. Then the two embroidered legs, now so fashionable as Persian embroideries ("naksh"), occupied a girl from childhood to marriage in making; they are *all sewing* in elaborate patterns of great beauty, worked on muslin in silk. The outdoor costume of the Persian women is quite another thing. Enveloped in a huge blue sheet, with a yard of linen as a veil perforated for two inches square with minute holes, the feet thrust into two huge bags of coloured stuff, a wife is perfectly unrecognizable, even by her husband, when out of doors. The dress of all is the same; and, save in quality or costliness, the effect is similar.

As for the children, they are always when infants swaddled; when they can walk they are dressed as little men and women, and with the dress they generally ape the manners. It is a strange custom with the Persian ladies to dress little girls as boys, and little boys as girls, till they reach the age of seven or eight years; this is often done for fun, or on account of some vow—oftener to avert the evil eye.

Towns.—The principal cities of Persia with their populations as estimated in 1908 are: Teherān (280,000); Tabriz (200,000); Isfahan (100,000); Meshed (80,000); Kermān, Resht, Shiraz (60,000); Barfurush, Kazvin, Yezd (50,000); Hamadan, Kermānshāh (40,000); Kashan, Khoi, Urmia (35,000); Birjend, Burujird, Bushire, Dizful, Kum, Senendij (Sinna), Zenjan (25,000 to 30,000); Amol, Ardebil, Ardistan, Astarabad, Abekuh, Bam, Bander, Abbasi, Bander Lingah, Damghan, Dilman, Istahbanat, Jahrum, Khunsar, Kumishah, Kuchan, Marand, Maragha, Nishapur, Sari, Sabzevar, Samnan, Shahrud, Shushter (10,000 to 20,000).

Political and Administrative Divisions.—The empire of Persia, officially known as *Mamalik i Mahruseh i Iran*, "the protected kingdoms of Persia," is divided into a number of provinces, which, when large, and containing important sub-provinces and districts, are called *mamlikat*, "kingdom," when smaller, *vilayat* and *ayalat*, and are ruled by governors-general and governors appointed by and directly responsible to the Crown. These provinces are further divided into sub-provinces, *vilayats*, districts, sub-districts and parishes, *buluk*, *nahiyeh*, *mahal*, and towns, cities, parishes and villages, *shehr*, *kassabeh*, *mahalleh*, *dih*, which are ruled by lieutenant-governors and other functionaries appointed by and responsible to the governors. All governors are called *hakim*, or *hukmran*, but those of large provinces generally have the title of *vali*, and sometimes *firmân-firma*. A governor of a small district is a *zabit*; a deputy-governor is called *naib el hukumeh*, or *naib el ayaleh*; an administrative division is a *kalamro*, or *hukumat*. Until recently the principal governorships were conferred upon the shah's sons, brothers, uncles and other near relatives, but now many of them are held by men who have little if any connexion with the royal family. Also, the governors are now, as a rule, resident in their provinces instead of being absentees at the capital. There are also some small districts or dependencies generally held in fief, *turyul*, by princes or high functionaries who take the revenues in lieu of salaries, pensions, allowances, &c., and either themselves govern or appoint others to do so.

Every town has a mayor, or chief magistrate, called *beglerbegi*, "lord of lords," *kalantar*, "the greater," and sometimes *darogha*, "overseer," or chief of police; every ward or parish, *mahalleh*, of a town and every village has a head-man called *ked khoda*, "house-lord." These officers are responsible to the governor for the collection of the taxes and the orderly state of their towns, parishes and villages. In the important provinces and sub-provinces the governors are assisted by a man of experience, to whom the accounts and details of the government are entrusted. This person, called *vizier*, or *paishkar*, is often nominated by the shah, and his functions in the provincial government are similar to those of the grand vizir in the central government, and comprise very extended administrative powers, including at times the command of the military forces in his province. Among the nomads a different system of titles prevails, the chiefs who are responsible for the taxes and the orderly conduct of their tribes and clans being known as *ilkhani*, *ilbegi* (both meaning "tribe-lord," but the latter being considered an inferior title to the former), *khan*, *rais*, *amir*, *mir*, *shaikh*, *tushmal*, &c.

The governors and chiefs, excepting those possessing hereditary rights, are frequently changed; appointments are for one year only and are sometimes renewed, but it does not often occur that an official holds the same government for longer than that period, while it happens rarely that a province is governed by the same person for two or three years. This was not so formerly, when not infrequently an official, generally a near relation of the shah, held the same governorship for five, ten or even more years. The governorship of the province of Azerbaijan was an exception until the end of 1906, being always held by the *Valiahd*, "heir apparent," or crown prince.

The political divisions of Persia, provinces, sub-provinces, districts, &c., ruled by *hakims* number over 200 (cf. the statement in Nöldeke's *Geschichte des Artachšîr Pâpakân*, "after Alexander's death there were in Iran 240 local governors"), but the administrative divisions, *hukumat*, or *kalamro*, with governors appointed by the Crown and responsible to it for the revenues, have been under fifty for sixty-five years or more. In 1840 there were twenty-nine administrative divisions, in 1868 twenty-two, in 1875 twenty-nine, in 1884 nineteen, in 1890 forty-six, and in 1908 thirty-five, as follows:—

(*a*) *Provinces*:—

1. Arabistan and Bakhtiari.	14. Kamseh.
2. Astarabad and Gurgan.	15. Khar.
3. Azerbaijan.	16. Khorasan.
4. Fars.	17. Kum.
5. Gerrus.	18. Kurdistan.
6. Gilan and Talish.	19. Luristan and Burujird.
7. Hamadan.	20. Mazandaran.
8. Irak, Gulpaigan, Khunsar, Kamereh, Kezzaz, Ferakan.	21. Nehavend, Malayir and Tusirkhan.
	22. Savah.
9. Isfahan.	23. Samnan and Damghan.
10. Kashan.	24. Shahrud and Bostam.
11. Kazvin.	25. Teherān.
12. Kermān and Baluchistan.	26. Zerend and Bagdadi Shahsevens.
13. Kermānshāh.	

(*b*) *Dependencies, or Fiefs*:—

1. Asadabad.	6. Natanz.
2. Demavend.	7. Talikan.
3. Firuzkuh.	8. Tarom Ulia.
4. Josehekan.	9. Kharakan.
5. Kangaver.	

Roads.—With the exception of five short roads, having an aggregate length of less than 900 m., all the roads of the country are mere mule tracks, carriageable in the plains and during the dry season, but totally unfit for continuous wheeled traffic during all seasons, and in the hilly districts often so difficult as to cause much damage to goods and the animals carrying them. There are a few miles of roads in the immediate neighbourhood of Teherān leading from the city to royal palaces, but not of any commercial

importance. The five exceptions are: (1) Resht-Kazvin-Teherān, 227 m.; (2) Julfa-Tabriz, 80 m.; (3) Teherān-Kum-Sultanabad, 160 m.; (4) Meshed-Kuchan-Askabad, 150 m.; 30 of which are on Russian territory; (5) Isfahan-Ahvaz, 280 m. The first of these roads consists of two sections: Resht-Kazvin, 135 m., and Kazvin-Teherān, 92 m. The first section was constructed in 1897-1899 by a Russian company, in virtue of a concession which the Persian government granted in 1893; and the second section was constructed in 1878-1879 by the Persian government at a cost of about £20,000, ceded to the concessionnaire of the first section in 1896, and repaired and partly reconstructed by the Russian company in 1898-1899. Both sections were officially opened to traffic in August 1899. The capital of the company is 3,200,000 roubles (£341,330), of which 1,700,000 is in shares taken by the public, and 1,500,000 in debentures taken by the Russian government, which also guarantees 5 % on the shares. About two-thirds of the capital has been expended on construction. The company's income is derived from tolls levied on vehicles and animals using the road. These tolls were at first very high, but were reduced by 15 % in 1904, and by another 10 % in 1909. If all the trade between Russia and Teherān were to pass over this road, the tolls would no doubt pay a fair dividend on the capital, but much of it goes by way of the Teherān Meshed-i-Sar route, which is much shorter and has no tolls. The second road, Julfa-Tabriz, 80 m., was constructed by the same Russian company in 1903. The third road, Teherān-Kum-Sultanabad, 160 m., also consists of two sections: the first, Teherān-Kum, 92 m., the other, Kum-Sultanabad, 68 m. The first section was constructed by the Persian government in 1883 at a cost of about £12,000, purchased by the Imperial Bank of Persia in 1890 for £10,000, and reconstructed at a cost of about £45,000. The second section formed part of the "Ahvaz road concession" which was obtained by the Imperial Bank of Persia in 1890 with the object of connecting Teherān with Ahvaz on the Karun by a direct cart road via Sultanabad, Burujird, Khorremabad (Luristan), Dizful and Shushter. The concession was ceded to Messrs Lynch, of London, "The Persian Road and Transport Company," in 1903. The fourth cart-road, Meshed-Askabad, 120 m. to the Persian frontier, was constructed by the Persian government in 1889-1892 in accordance with art. v. of the Khorasan Boundary Convention between Russia and Persia of December 1881. The Persian section cost £13,000. The fifth road, Isfahan-Ahvaz, 280 m., is the old mule track provided with some bridges, and improved by freeing it of boulders and stones, &c., at a total cost of £5500. The concession for this road was obtained in 1897 by the Bakhtiari chiefs and ceded to Messrs Lynch, of London, who advanced the necessary capital at 6 % interest and later formed the Persian Road and Transport Company. The road was opened for traffic in the autumn of 1900. The revenue is derived from tolls levied on animals passing with loads. The tolls collected in 1907 amounted to £3100.

Railways.—Persia possesses only 8 m. of railway and 6½ m. of tramway, both worked by a Belgian company. The railway consists of a single line, one-metre gauge, from Teherān to Shah-abdul-Azim, south of Teherān, and of two branch lines which connect the main line with some limestone quarries in the hills south-east of the city. The tramway also is a single line of one-metre gauge, and runs through some of the principal streets of Teherān. The length of the main railway line is 5½ m., that of the branches 2½. The main line was opened in 1888, the branches were constructed in 1893, and the tramway started in 1889. The capital now invested in this enterprise, and largely subscribed for by Russian capitalists, amounts to £320,000. There are also ordinary shares to the amount of £200,000 put down in the company's annual balance-sheets as of no value. The general opinion is that if Russian capitalists had not been interested in the enterprise the company would have liquidated long ago. (On railways in Persia, the many concessions granted by the Persian government, and only one having a result, ch. xviii. of Lord Curzon's *Persia* [i. 613-639], and on the Belgian enterprise, Lorini's *La Persia economica* [pp. 157-158] may be consulted.)

Posts.—Down to 1874 the postal system was in the hands of an official called *chaparchi bashi*, who was the head farmer of the post, or *chapars*, and letters and small parcels were conveyed by him and his agents at high and arbitrary rates and without any responsibility. The establishment of a regular post was one on the results of the shah Nasr-ed-din's first visit to Europe (1873). Two officials of the Austrian postal department having been engaged in 1874, an experiment of a post office upon European lines was made in the following year with a postal delivery in the capital and some of the neighbouring villages where the European legations have their summer quarters. In the beginning of 1876 a regular weekly post was established between Teherān, Tabriz and Julfa (Russo-Persian frontier) and Resht. Other lines, connecting all the principal cities with the capital, were opened shortly afterwards, and on the 1st of September 1877 Persia joined the international postal union with the rates of 2½d. per ½ oz. for letters, 1d. for post-cards, ½d. per 2 oz. for newspapers, &c., between Persia and any union country. The inland rates were a little less. There are now between Persia and foreign countries a bi-weekly service via Russia (Resht-Baku, Tabriz-Tiflis) and a weekly service via India (Bushire-Bombay). On the inland lines, with the exception of that between Teherān and Tabriz, the service is weekly. There are reported to be 140 post offices. Statistics as to the number of letters, post-cards, newspapers, &c., conveyed are kept but not published; and since 1885, when a liberal-minded director communicated those for the year 1884-1885 to the present writer, no others, although many times promised, have been obtained. In the year 1884-1885 there were conveyed 1,368,835 letters, 2050 post-cards, 7455 samples, and 173,995 parcels, having a value of £304,720; and the receipts exceeded the expenditure by £466. Since then the traffic has much increased, and the excess of receipts over expenditure in the year 1898-1899 was reported to have been £10,000, but was probably more than that, for the minister of posts farmed the department for £12,000 per annum. The farm system was abolished in 1901 and in the following year the post office was joined to the customs department worked by Belgian officials. Under the most favourable conditions letters from London via Russia are delivered at Tabriz in 9 days, at Teherān in 10, at Isfahan in 14, and at Shiraz in 18 days; and via India, at Bushire in 26 days, at Shiraz in 31, at Isfahan in 36, and at Teherān in 40 days; but during the winter letters between London and Teheran sometimes take a month. In the interior the mails are conveyed on horseback, and, being packed in badly-made soft leather bags, are frequently damaged through careless packing and wet. The first Persian postage stamps were issued in 1875 and roughly printed in Persia. Since then there have been numerous issues, many practically bogus ones for collectors. Authentic specimens of the early ones are much valued by stamp collectors. (For information on the postal system of Persia, see G. Riederer, *Aus Persien*, Vienna, 1882; Fr. Schueller, *Die persische Post und die Postwerthzeichen von Persien*, Vienna, 1893.)

Telegraphs.—The first line of telegraphs—from Teherān to Sultanieh, about 160 m. on the road to Tabriz—was constructed in 1859. In the following year it was continued to Tabriz, and in 1863 to Julfa on the Russian frontier. With the object of establishing a direct telegraphic communication between England and India, by connecting the European and Indian systems by a land line through Persia from Bagdad—then the most easterly Turkish telegraphic station—to Bushire and by a cable from Bushire eastwards, a telegraphic convention was concluded in the same year between the British and Persian governments, and a one-wire line on wooden posts from the Turkish frontier, near Bagdad, to Bushire via Kermānshāh, Hamadan, Teherān, Isfahan and Shiraz, was constructed at the cost and under the supervision of the British government. In 1865 a new convention, providing for a second wire, was concluded, and for some years messages between Europe and India were transmitted either via Constantinople, Bagdad, Teherān, Bushire, or via Russia, Tiflis, Tabriz, Teherān, Bushire. An alternative line between Bagdad and India was created by the construction of a land line to Fao, at the head of the Persian Gulf, and the laying of a cable thence to Bushire. The service was very inefficient, and messages between England and India took several days and sometimes weeks to reach their destination. In 1869 Messrs Siemens of Berlin, in virtue of concessions obtained in the year before and later disposed of to the Indo-European Telegraph Company, Ltd.—who also took over Reuter's cable from Lowestoft to Emden (274 knots)—constructed a two-wire line on iron posts through Germany and Russia, and in Persia from Julfa to Teherān. This line was opened on the 31st of January 1870. The British government then handed the Bagdad-Teherān section, which had become unnecessary for international through traffic between Europe and India, over to the Persian government, and changed its Teherān-Bushire line into one of two wires on iron posts. In 1873, according to a convention signed December 1872, a third wire was added to the line, and there was then a three-wire line on iron posts (439 m. Indo-European Telegraph Company, 675 m. Indian government) from Julfa to Bushire. In August 1901 a convention was concluded between the British and Persian governments for a three-wire line on iron posts from Kashan (a station on the Teherān-Bushire line) to Baluchistan via Yezd, Kermān and Bam (805 m.). The construction of this "Central Persia line," as it is known officially, was begun in December 1902 and completed in March 1907. The section Kashan-Isfahan of the old Teherān-Bushire was then taken up and Isfahan was connected with the Central Persia line by a two-wire line from Ardistan, 71 m. south-east from Kashan. One of the three wires between Isfahan and Bushire was also taken up, and there are now a five-wire line from Teherān to Ardistan (224½ m.), a three-wire line from Ardistan to the Baluchistan frontier (734 m.) and a two-wire line from Ardistan to Bushire (497 m.). These lines, as well as that of the Indo-European Telegraph Company from Julfa to Teherān, are worked throughout by an English staff and may be classed among the finest and most efficient in the world. The central line is continued through Baluchistan to Karachi, and from Bushire messages go by cable (laid in 1864) to Jask, and thence either by cable or by land to Karachi, Bombay, &c. The telegraphic convention between the British and Persian governments has again been renewed, and is in force until 1925; and the concessions to the company were prolonged to the same year by the Russian government in March 1900. In addition to these lines, Persia possesses 4191 m. of single-wire lines on wooden poles belonging to the Persian government and worked by a Persian staff; the

Teherān-Meshed line (555 m.), however, is looked after by an English inspector and two English clerks at Meshed, and since 1885 the Indian government has allowed a sum not exceeding 20,000 rupees per annum for its maintenance; and the Meshed-Seistan line, 523 m., is looked after by twelve Russian inspectors and clerks. The Persian lines are farmed out for 1,800,000 krans (about £36,000) per annum and no statistics are published. There are in all 131 stations. Statistics of the traffic on the Indo-European line are given in the administration reports of the Indo-European telegraph department, published by government, and from them the figures in the following table have been obtained:—

Year.	Traffic over Lines between London and Karachi.	Earnings in thousands of Pounds.		Net Profits of the Government Dept.	
	Number of Messages transmitted.	Government Department.	Indo-European Telegraph Co.	Total amount. Rupees.	Percentage on Capital Outlay.
1887–1888	83,031	74	100	198,381	1·75
1892–1893	117,500	84	116	437,668	3·80
1897–1898	146,988	106	145	758,172	6·57
1902–1903	178,250	111	155	589,571	4·50
1905–1906	211,003	113	157	774,368	5·39
1906–1907	259,355	108	149	458,559	3·09

Manufactures, &c.—The handbook on Persian art published by Colonel Murdoch Smith, R.E., in 1876, with reference to the collection purchased and sent home by him for the Victoria and Albert Museum, has an instructive account of the more common manufactures of the country. They are classified under the respective heads of "porcelain and earthenware," "tiles," "arms and armour," "textile fabrics," "needlework and embroidery," "metal-work," "wood carving and mosaic-painting," "manuscripts," "enamel," "jewelry" and "musical instruments." Specimens of the greater number are not only to be procured in England, but are almost familiar to the ordinary Londoner. It need scarcely be said that tiles have rather increased in value than deteriorated in the eyes of the connoisseur, that the ornamentation of metal-work, wood carving and inlaying, gem and seal engraving, are exquisite of their kind, and that the carpets manufactured by skilled workmen, when left to themselves and their native patterns, are to a great extent unrivalled. Of the above-mentioned articles, carpets, shawls, woollen and cotton fabrics and silk stuffs are the more important. Carpets may be divided into three categories: (1) *Kali*, with a pile, and cut like plush; (2) *gilim*, smooth; (3) *nimads*, felts. Only the two first are exported. The *Kali* and its smaller sizes, called *Kalicheh* (in Europe, rugs), are chiefly made in Ferahan, Sultanabad (Irak), Khorasan, Kurdistan, Karadagh, Yezd, Kermān, and among the nomad tribes of southern Persia. From the two first-mentioned localities, where a British firm has been established for many years, great quantities, valued in some years at £100,000, find their way to European and American markets, while rugs to the value of £30,000 per annum are exported from the Persian Gulf ports. Of the second kind, *gilim* (used in Europe for curtains, hangings, and chair-covers), considerable quantities are exported from Shushter and Kurdistan. The value of the carpets exported during the year 1906–1907 was close upon £900,000, Turkey taking £613,300, Russia £196,700, United States £40,600, Great Britain £20,700, Egypt £18,500 and India £5400. Shawls are manufactured in Kermān and Meshed, and form an article of export, principally to Turkey. Woollen fabrics are manufactured in many districts, but are not exported in any great quantity. Coarse cotton stuffs, chiefly of the kind called *Kerbas*, used in their natural colour, or dyed blue with indigo, are manufactured in all districts but not exported; cottons, called Kalamkar, which are made in Manchester and block-printed in colours at Isfahan and Kumishah, find their way to foreign markets, principally Russian. Of silk fabrics manufactured in Persia, principally in Khorasan, Kashan and Yezd, about £100,000 worth per annum is exported to Turkey, Russia and India. In the environs of Kashan and in Fars, chiefly at Maimand, much rose-water is made, and a considerable quantity of it is exported by way of Bushiro to India and Java. Many attempts have been made to start manufactures, supported by foreign capital and conducted by foreigners, but nearly all have resulted in loss. In 1879 the Persian government was induced to spend £30,000 on the erection of a gas factory in Teherān, but work was soon stopped for want of good coal. A few years later a Persian bought the factory and plant for £10,000, and made them over in 1891 to the Compagnie générale pour l'éclairage et le chauffage en Perse, which after bringing out much additional plant, and wasting much capital in trying for some years in vain to make good and cheap gas out of bad and dear coal, closed the factory. In 1891 another Belgian company, Société anonyme des verreries nationales de Perse, opened a glass factory in Teherān, but the difficulty of obtaining the raw material cheaply and in large quantities was too great to make it a paying concern, and the factory had to be closed. A third Belgian company, Société anonyme pour la fabrication du sucre en Perse, with a large capital, then came to Persia, and began making beetroot sugar in the winter of 1895. But, like the gas and glass companies, it found the cost of the raw material and the incidental expenses too great, and ceased its operations in 1899. In 1890 a Russian company started a match factory near Teherān with an initial outlay, it is said, of about £20,000, but could not successfully compete with Austrian and Swedish matches and ceased operations very soon. A Persian gentleman erected a cotton-spinning factory at Teherān in 1894 with expensive machinery; it turned out some excellent yarn but could not compete in price with imported yarns.

Agricultural Products.—Wheat, barley and rice are grown in all districts, the two former up to considerable altitudes (8000 ft.), the last wherever the water supply is abundant, and in inner Persia generally along rivers; and all three are largely exported. The most important rice-growing districts which produce more than they require for local consumption and supply other districts, or export great quantities, are Astarabad, Mazandaran, Gilan, Veramin, (near Teherān), Lenjan (near Isfahan), and some localities in Fars and Azerbaijan. Peas, beans, lentils, gram, maize, millet, are also universally cultivated, and exported from the Persian Gulf ports to India and the Arabian coast. The export of rice amounted to 52,200 tons in 1906–1907, and was valued at £472,550. The Persian fruit is excellent and abundant, and large quantities, principally dried and called khushkbar (dry fruit), as quinces, peaches, apricots, plums (of several kinds), raisins, figs, almonds, pistachios, walnuts and dates (the last only from the south), as well as oranges (only from the Caspian provinces), are exported. The fruit exported during 1906–1907 had a value of £1,019,000. Nothing is being done to improve the vine, and the Persian wines, until recently of world-wide reputation, are yearly getting thinner and poorer. The phylloxera has done much damage. The naturalist S. G. Gmelin, who explored the southern shores of the Caspian in 1771, observed that the wines of Gilan were made from the wild grape. Cotton is largely grown, principally in the central districts and Khorasan, and some qualities are excellent and command high prices in the European markets; 18,400 tons of raw cotton, valued at £838,787, were exported to Russia in 1906–1907. Good hemp grows wild in Mazandaran. Tobacco of two kinds, one the *tumbaku* (*Nicotiana persica*, Lindl.), for water pipes, the other the *tutun* (*Nicotiana rustica*, L.), for ordinary pipes and cigarettes, is much cultivated. The tumbaku for export is chiefly produced in the central districts round about Isfahan and near Kashan, while the tumbaku of Shiraz, Fessa, and Darab in Fars, considered the best in Persia, is not much appreciated abroad. Tutun is cultivated in Azerbaijan, near Urmia and other places near the Turkish frontier, in Kurdistan, and, since 1875, in the district of Resht, in Gilan. About 1885 the quantity of tobacco exported amounted to between 4000 and 5000 tons. In 1906–1907 only 1820 tons, valued at £42,000, were exported. The cultivation of poppy for opium greatly increased after 1880, and it was estimated in 1900 that the annual produce of opium amounted to over 1000 tons, of which about two-fifths was consumed and smoked in the country. The principal opium-producing districts are those of Shiraz, Isfahan, Yezd, Kermān, Khorasan, Burujird and Kermānshāh. While the quantity consumed in the country is now probably the same, the quantity exported is much less: 239 tons, valued at £237,270 in 1906–1907. The value of the silk produced in Persia in the 'sixties was £1,000,000 per annum, and decreased in consequence of silk-worm disease to £30,000, in 1890. The quantity produced has since then steadily increased and its yearly value is estimated at half a million. Cocoons and raw silk valued at £316,140 were exported in 1906–1907. Of oil-yielding plants the castor-oil plant, sesame, linseed and olive are cultivated, the last only in a small district south of and near Resht. Very little oil is exported. The potato, not yet a staple article of food, tomatoes, celery, cauliflower, artichokes and other vegetables are now much more grown than formerly, chiefly in consequence of the great influx of Europeans, who are the principal consumers.

Among the valuable vegetable products forming articles of export are various gums and dyes, the most important being gum tragacanth, which exudes from the astragalus plant in the hilly region from Kurdistan in the north-west to Kermān in the south-east. Other gums are gum-ammoniac, asafetida, galbanum, sagapanum, sarcocolla and opoponax. In 1906–1907, 3310 tons of various gums of a value of £300,000 were exported. Of dye-stuffs there are produced henna (*Lawsonia inermis*) principally grown at Khabis near Kermān, woad and madder; a small quantity of indigo is grown near Dizful and Shushter. The export of dyes in 1906–1907 was 985 tons, valued at £32,326.

Horses, mules and donkeys, formerly exported in great numbers, are at present not very abundant, and their prices have risen much since 1880. Some nomad tribes who owned many brood mares, and yearly sold hundreds of horses, now hardly possess sufficient animals for their own requirements. The scarcity of animals, as well as the dearness of fodder, is one of the causes of the dearness of transport, and freights have risen on the most frequented roads from 3d. per ton-mile in 1880 to 10d., and even 13d., per ton-mile.

The prices of staple articles of food rose steadily from 1880 and

reached a maximum in 1900 and 1901, as will be seen from the following table:—

	Average Price, 1880.		Price, April 1900.		Price, June 1908.	
	s.	d.	s.	d.	s.	d.
Wheat, per kharvar (649 lb)	22	6	102	0	32	0
Rice "	56	3	64	0	64	0
Bread, ordinary, per mann (6½ lb)		3·60		9·60		3·84
Meat, mutton (per mann)	1	2·40	2	9·60	1	5·28
Cheese "	1	0	2	4·80	1	10
Clarified butter "	2	3	4	9·60	5	4·80
Milk "		4·50		9·60		7·68
Eggs, per 100	1	6	3	7·20	3	2·40

Forests and Timber.—Timber from the forests of Mazandaran and Gilan has been a valuable article of export for many years, and since about 1870 large quantities of boxwood have also been exported thence; in some years the value of the timber and boxwood exported has exceeded £50,000. This value represented about 200,000 box trees and quite as many others. Much timber is also used for charcoal-burning, and occasionally large parts of forest are burned by the people in order to obtain clearings for the cultivation of rice. The destruction of the forests by timber-cutters and charcoal-burners has been allowed to go on unchecked, no plantations have been laid out, and nothing has been done for forest conservation. Indiscriminate cutting has occasionally been confined within certain bounds, but such restrictions were generally either of short duration or made for the convenience and profit of local governors. The oak forests of Kurdistan, Luristan and the Bakhtiari district are also being rapidly thinned. A small step in the right direction was made in 1900 by engaging the services of an official of the Prussian forest department, but unfortunately, beyond sending him to inspect the Mazandaran forests belonging to the Crown, and employing him to lay out a small plantation in the Jajrud valley, east of Teherān, nothing was done. The monopoly for cutting and exporting the timber of the Mazandaran forests is leased to European firms, principally for box and oak. Boxwood has become scarce. There are many kinds of good timber-yielding trees, the best known being alder (*Alnus glutinosa*, Willd., *A. barbata*, *A. cordifolia*, Ten.), ash (*Fraxinus excelsior*, L.), beech (*Fagus sylvatica*), elm (*Ulmus campestris*, *U. effusa*, *U. pedunculata*), wych-elm (*Ulmus montana*), hornbeam (*Carpinus betulus*, L.), juniper (*Juniperus excelsa*, *J. communis*, *J. sabina*), maple (*Acer insigne*, Boiss., *A. campestre*, *A. pseudo-platanus*, L.), oak (*Quercus ballota*, *Q. castaneaefolia*, *Q. sessiliflora*, *Q. pedunculata*), walnut, nettle tree (*Celtis australis*, L.), Siberian elm (*Zelkova crenata*, Spach.), and various kinds of poplar. Pipe-sticks, from the wild cherry tree, are exported to Turkey.

Fisheries.—Fish is a staple food along the shores of the Persian Gulf, but the Crown derives no revenue from fisheries there. The fisheries of the Caspian littoral are leased to a Russian firm (since 1868), and most of the fish goes to Russia (31,120 tons, value £556,125, in 1906–1907). The fish principally caught are sturgeon, giving caviare, sheat fish or silure, salmon, carp, bream and perch.

Minerals and Mining.—Persia possesses considerable mineral riches, but the absence of cheap and easy means of transport, and the scarcity of fuel and water which prevails almost everywhere, make any exploitation on a remunerative scale impossible, and the attempts which have been made to work mines with European capital and under European superintendence have been financially unsuccessful. Deposits of rich ores of copper, lead, iron, manganese, zinc, nickel, cobalt, &c., abound. A few mines are worked by natives in a primitive, systemless manner, and without any great outlay of capital. There are turquoise mines near Nishapur (for description of mines, manner of working, &c., see A. Houtum-Schindler, *Report on the Turquoise Mines in Khorasan*, F. O. Reports, 1884, and "Die Gegend zwischen Sabzwar und Meschhed," *Jahrbuch k. k. geol. R. A. Wien*, vol. xxxvi.; also E. Tielze, *Verhandl. k. k. geol. R. A.*, 1884, p. 93); several copper mines in Khorasan, Samnan, Azerbaijan and Kermān; some of lead, two considerably argentiferous, in Khorasan, Tudarvar (near Samnan), Anguran, Afshar (both west of Zenjan), and Kermān; two of iron at Mesula in Gilan and Nur in Mazandaran; two of orpiment in Afshar and near Urmia; one of cobalt at Kamsar (near Kashan); one of alum in Tarom (near Kazvin); and a number of coal in the Lar district, north-east of Teherān, and at Hiv and Abyek, north-west of Teherān. There are also many quarries of rock-salt, gypsum, lime and some of marble, alabaster, soapstone, &c. The annual revenue of the government from the leases, rents and royalties of mines does not amount to more than £15,000, and about £6000 of this amount is derived from the turquoise mines near Nishapur. As the rents and royalties, excepting those on the turquoise mines, amount to about one-fifth of the net proceeds, it may be estimated that the value of the annual output does not exceed £50,000, while the intrinsic value of the ores, particularly those of lead, iron, cobalt and nickel, which have not yet been touched can be estimated at millions. There are also some very rich coal seams in eastern Persia, far away on the fringe of the desert, and under existing conditions quite valueless. The richest deposits of nickel, cobalt and antimony ores are also situated in localities where there is little water and the nearest useful fuel some hundred miles away. Auriferous alluvial strata have been discovered in various localities, but everywhere the scarcity of water has been a bar to their being exploited with profit. A rich naphtha-bearing zone stretches from the Luristan hills near Kermānshāh down to the Persian Gulf. Competent engineers and specialists have declared that borings in the Bakhtiari hills, west of Shushter, would give excellent results, but the difficult hilly country and the total absence of roads, as well as the antipathy of the inhabitants of the district, would make the transport and establishment of the necessary plant a most difficult matter. A British syndicate has been boring at several places in the zone since 1903.

Commerce.—The principal centres of commerce are Tabriz, Teherān, Resht, Meshed and Yezd; the principal ports Bander Abbasi, Lingah, Bushire and Muhamrah on the Persian Gulf, and Astara, Enzeli, Meshed i Sar and Bander i Gez on the Caspian.

Until 1899 all the customs were farmed out (1898–1899 for £300,000), but in March of that year the farm system was abolished in the two provinces of Azerbaijan and Kermānshāh, and, the experiment there proving successful, in all other provinces in the following year. At the same time a uniform duty of 5 % *ad valorem* was established. In October 1901 a treaty fixing a tariff and reserving "the most favoured nation" treatment for the countries already enjoying it was concluded between Persia and Russia. It was ratified in December 1902 and came into force on the 14th of February 1903. The commercial treaty with Great Britain, concluded in 1857, provided for the "most favoured nation" treatment, but nevertheless a new treaty under which the duties levied on British imports would be the same as on Russian imports was made with Great Britain a few days before the new tariff came into force and was ratified in May.

For the value of imports and exports previous to 1901 the only statistics available were the figures given in consular reports, which were not always correct. In 1897 it was estimated that the value of the imports from and exports to Great Britain, including India, amounted to £3,250,000. About a quarter of this trade passed over the western frontier of Persia, while three-quarters passed through the Persian Gulf ports. The value of the trade between Russia and Persia was then about £3,500,000. Since 1901 detailed statistics have been published by the customs department, and according to them the values of the imports and exports in thousands of pounds sterling for the six years 1901–1907 were as follow:—

	Imports.	Exports.	Total.
1901–1902	5429	2738	8,167
1902–1903	4970	3388	8,358
1903–1904	7000	4632	11,632
1904–1905	5832	4132	9,964
1905–1906	6441	4886	11,327
1906–1907	7982	6544	14,526

The imports and exports during the year 1906–1907 (total value £14,526,234) were distributed as follows (values in thousands sterling):—

Russia	8292	U.S. America	69
Great Britain	3128	Italy	65
Turkey	1335	Egypt	41
France	700	Netherlands	37
Austria	277	Belgium	24
Afghanistan	203	Switzerland	22
Germany	182	Sweden	8
China	142	Other countries	1
			14,526

While the value of the trade between Great Britain and Persia in 1906–1907 was almost the same as in 1897, that of the trade with Russia had increased from 3½ millions to 8¼ or 137 %. The average yearly value of the trade between Great Britain and Persia during the six years was £2,952,185 (imports £2,435,016, exports £517,169); between Russia and Persia £6,475,866 (imports £3,350,072, exports £3,125,794). The average values of the trade with other countries were: France £666,000, Austria £246,000, Germany £124,000, Italy £79,000, United States of America £52,000, Netherlands £39,000.

The principal imports into Persia in approximate order of value are cottons, sugar, tea, woollens, cotton yarn, petroleum, stuffs of wool and cotton mixed, wool, hardware, ironmongery, matches, iron and steel, dyes, rice, spices and glassware. The principal exports are fruits (dried and fresh), carpets, cotton, fish, rice, gums, wool, opium, silk cocoons, skins, live animals, silks, cottons, wheat, barley, drugs and tobacco.

Shipping and Navigation.—Shipping under the Persian flag is restricted to vessels belonging to the Persian Gulf ports. Some of the larger craft, which are called *baglah*, and vary from 50 to 300 tons, carry merchandise to and from Bombay, the Malabar

coast, Zanzibar, &c.; while the smaller vessels, called *bagarah*, and mostly under 20 tons, are employed in the coasting trade and the pearl-fisheries on the Arabian coast. It is estimated that the four principal ports and the many smaller ones (as Mashur, Hindian, Zaidin, Bander, Dilam, Rig, Kongan, Taheri, Kishm, Hormuz, &c.) possess at least 100 *baglahs* and several hundred *bagarahs*, besides a large number of small boats. The following figures from the commercial statistics published by the Persian Customs Department show the total shipping at the four principal Persian Gulf ports, Bushire, Bander Lingab, Bander Abbasi and Muhamrah during the years 1904–1907:—

	1904–1905.	1905–1906.	1906–1907.
	Tons.	Tons.	Tons.
British . . .	671,386	827,539	826,594
Persian . . .	36,797	25,069	6,425
Russian. . .	24,121	29,182	40,616
Arabian. . .	22,487	16,749	7,932
Turkish. . .	3,176	3,877	5,005
French . . .	2,901	570	—
German. . .	—	—	52,935
Total . .	760,868	902,986	939,507

The British shipping amounted to 89·2 % of the total shipping at the four ports during the years 1904–1907. There was no German shipping in the gulf before 1906, but in the first year of its appearance (1906–1907), its tonnage at the gulf ports was almost as much as that of all other nations with the exception of Great Britain.

The shipping of 1906–1907 was distributed among the four ports as follows:—

Bushire . . .	354,798 tons.	Bander Abbasi .	245,746 tons.
Bander Lingah	155,720 „	Muhamrah . . .	183,243 „

Bander Lingah, being the port where most of the pearls obtained on the Arabian coast of the gulf are brought to and exported from, has more native shipping (all sailing vessels) than the other ports.

All the shipping on the Caspian is under the Russian flag[1] and no returns of the arrivals and departures of vessels at the Persian ports were published before 1906. According to the statistics of the customs department the shipping of the Persian ports amounted in 1906–1907 to 650,727 tons. The shipping at the principal Persian ports on the Caspian in the year 1906–1907 was: Astara 137,935 tons; Enzeli 202,132 tons; Meshed i Sar 90,799 tons; Bander-l-Gez 56,135 tons. Two or three flat-bottomed sailing vessels navigate the lake of Urmia in north-western Persia, carrying merchandise, principally agricultural produce, from the western and south-western shores to the eastern for the supply of Tabriz. The navigation is a state monopoly, leased out for £250 per annum.

Coinage, Weights and Measures.—The monetary unit is the kran, a silver coin, formerly weighing 28 nakhods (88 grains), then reduced to 26 nakhods (77 grains), and now weighing only 24 nakhods (71 grains) or somewhat less. Before the new coinage came into use (1877) the proportion of pure silver was from 92 to 95 %; subsequently the proportion was for some time 90 %; now it is about 89½ %. In consequence of this depreciation of the coinage and the fall in the price of silver, partly also in consequence of exchange transactions by banks, the value of the kran has since 1895 rarely been more than 4·80d., or half what it was in 1874, and fell to less than 4d. in 1905. In 1874 the kran was worth a franc; in June 1908 the exchange for a £1 bill on London was 50 krans which gives the value of 1 kran as 4⅘d. Taking this value of the kran, the values of the various nickel and silver coins in circulation work out as:—

Nickel Coins.		Silver Coins.	
Shahi = 2 pul . .	0·24d.	Five shahis = ¼ kran .	1·20d.
Two shahis = 4 pul .	0·48d.	Ten shahis = ½ kran .	2·40d.
		One kran = 20 shahis = 40 pul	4·80d.
		Two krans	9·60d.

In 1899 from 80 to 83 copper shahis (weighing about ⅕ lb) were being given for one silver kran. This was owing to the depreciation of the copper coinage from 1896 onwards, consequent upon there being an excess of coinage due to the excessive quantities formerly put in circulation from the mint. Accordingly the government in 1900 replaced the copper by a nickel coinage (face value of nickel coin in circulation end of 1907, 4,000,000 krans). Accounts are kept in dinars, formerly a gold piece, now an imaginary coin $\frac{1}{1000}$ of a kran. Ten thousand dinars are equal to one *toman* (a word meaning ten thousand), or 10 krans silver, and 50 dinars are one shahi.

Gold coins are: ¼, ½, 1, 2, 5, and 10 toman pieces, but they are not in circulation as current money because of their ever-varying value in silver krans, which depends upon the exchange on London.

The unit of weight is the miskal (71 grains), subdivided into 24 nakhods (2·96 grains), a nakhod being further subdivided into 4 gandum (·74 grains). Larger weights, again, are the sir (16 miskals) and the abbasi, wakkeh, or kervankeh (5 sir). Most articles are bought and sold by a weight called batman, or man, of which there are several kinds, the principal being:—

Man-i-Tabriz = 8 abbasis	= 640	miskals	=	6·49 lb
Man-i-Noh abbasi = 9 abbasis	= 720	„	=	7·30 „
Man-i-Kohneh (the old man)	= 1000	„	=	10·14 „
Man-i-Shah = 2 Tabriz mans	= 1280	„	=	12·98 „
Man-i-Rey = 4 „ „	= 2560	„	=	25·96 „
Man-i-Bander abbasi	= 840	„	=	8·52 „
Man-i-Hashemi = 16 mans of	720	„	=	116·80 „

Corn, straw, coal, &c., are sold by kharvar = 100 Tabriz mans = 649 lb.

The unit of measure is the zar or gez, of which, as in the case of the man, there are several variants. 40·95 in. is the most common length for the zar, but in Azerbaijan the length is 44·09 in. Long distances are calculated in farsakhs, a farsakh being equal to 6000 zar. Probably the zar in this measure = 40·95 in., which makes the farsakh 3·87 m., but the other length of the zar is sometimes used, when the farsakh becomes 4·17 m. Areas are measured in jeribs of from 1000 to 1066 square zar of 40·95 in., the surface unit thus being from 1294 to 1379 sq. yds.

Constitution and Government.—Up to the year 1906 the government of Persia was an absolute monarchy, and resembled in its principal features that of the Ottoman Empire, with the exception, however, that the monarch was not the religious head of the community. The powers of the Shah (Shahanshah,[2] or "king of kings") over his subjects and their property were absolute, but only in so far as they were not opposed to the *shar'*, or "divine law," which consists of the doctrines of the Mahommedan religion, as laid down in the Koran, the oral commentaries and sayings of the Prophet, and the interpretations by his successors and the high priesthood. In 1905, however, the people began to demand judicial reforms, and in 1906 cried out for representative institutions and a constitution. By a rescript dated the 5th of August Muzaffar-ud-Dīn Shah gave his assent to the formation of a national council (*Majlis i shora i milli*), to be composed of the representatives of the various classes: princes, clergy, members of the Kajar family and tribe—chiefs and nobles, landowners, agriculturists, merchants and tradesmen. By an ordinance of the 10th of September the number of members was fixed at 162 (60 for Teherān, 102 for the provinces), to be raised to 200 if necessary, and elections were held soon after. Electors must be males and Persian subjects of not less than 25 years of age and of good repute. Landowners must possess land of at least 1000 tomans (£200) in value, merchants and tradesmen must have a fixed and well-known place of business or shop with an annual value of not less than the average values in the localities where they are established. Soldiers and persons convicted of any criminal offence are not entitled to vote. The qualifications for membership are knowledge of the Persian language and ability to read and write it and good repute in the constituency. No person can be elected who is an alien, is under the age of 30 years or over the age of 70 years, is in the employ of the government, is in the active service of the army or navy, has been convicted of any criminal offence, or is a bankrupt.

On the 7th of October the national council, or as many members of it as could be got together, was welcomed by the shah and elected a president. This was considered as the inauguration and formal opening of parliament. An ordinance signed

[1] By article v. of the Treaty of Gulistan of 1813, confirmed by article viii. of the Treaty of Turkmanchai of 1828, it was declared that Russia alone should have the right of maintaining vessels of war on the Caspian, and that no other Power should fly the military flag on that sea; and by a decision of the council of the Russian Empire, published on the 24th of November 1869, the establishment of companies for the navigation of the Caspian, except by Russian subjects, and the purchase of shares of such companies by foreigners were prohibited. (*Sta's Papers*, vol. lxiii. 925.)

[2] We see this title in its old Persian form, *Khshayathiya Khshayathiy*, in the cuneiform inscriptions; as Βασιλέως Βασιλέων on the coins of the Arsacides, and as the Pahlavi *Malkan Malka* on the coins and in the inscriptions of the Sassanians. With the Mahommedan conquest of Persia and the fall of the Sassanians the title was abolished; it was in use for a short time during the 10th century, having been granted to Shah Ismail Samani by the Caliph Motadid A.D. 900; it appeared again on coins of Nadir Shah, 1736–1747, and was assumed by the present dynasty, the Kajars, in 1799.

by Muzaffar-ud-Din Shah, Mahommed Ali Mirza (his successor) and the grand vizir, on the 30th of December 1906, deals with the rescript of the 5th of August, states the powers and duties of the national council and makes provision for the regulation of its general procedure by the council itself. The members have immunity from prosecution except with the knowledge of the national council. The publicity of their proceedings except under conditions accepted by the council is secured. Ministers, or their delegates may appear and speak in the national council and are responsible to that body, which also has special control of financial affairs and internal administration. Its sanction is required for all territorial changes, for the alienation of state property, for the granting of concessions, for the contracting of loans, for the construction of roads and railways, for the ratification of treaties, &c. There was to be a senate of 60 members of whom 30 were to be appointed to represent the shah and 30 to be elected on behalf of the national council, 15 of each class being from Teherān and 15 from the provinces (the senate, however, was not immediately formed).

By a rescript dated February 2, 1907, Mahommed Ali Shah confirmed the ordinance of the 30th of December, and on the 8th of October 1907 he signed the final revised constitution, and took the oath which it prescribes on the 12th of November in the presence of the national council.

In accordance with the constitution the shah must belong to the Shiah faith, and his successor must be his eldest son, or next male in succession, whose mother was a Kajar princess. The shah's civil list amounts to 500,000 tomans (£100,000).

The executive government is carried on under a cabinet composed of seven or eight vizirs (ministers), of whom one, besides holding a portfolio, is vizir azam, prime minister. The vizirs are the ministers of the interior, foreign affairs, war, justice, finance, commerce, education, public works.

Until 1906 the shah was assisted in the task of government by the *sadr azam* (grand vizir), a number of vizirs, ministers or heads of departments somewhat on European lines, and a "grand council of state," composed of some ministers and other members nominated by the shah himself as occasion required. Many of the "ministers" would have been considered in Europe merely as chiefs of departments of a ministry, as, for instance, the minister for Crown buildings, that for Crown domains, the minister of ceremonies, those for arsenals, army accounts, &c.; also an accumulation of several offices without any connexion between their functions, in the hands of a single person, was frequently a characteristic departure from the European model. The ministers were not responsible to the Crown in a way that ministers of a European government are; they rarely took any initiative, and generally referred their affairs to the grand vizir or to the shah for final decision.

There were twenty-seven vizirs (ministers), but only some of them were consulted on affairs of state. The departments that had a vizir at their head were the following: court, ceremonies, shah's secretarial department, interior, correspondence between court and governors, revenue accounts and budget, finance, treasury, outstanding accounts, foreign affairs, war, army accounts, military stores, arsenals, justice, commerce, mines and industries, agriculture and Crown domains, Crown buildings, public works, public instruction, telegraphs, posts, mint, religious endowments and pensions, customs, press. In addition to these twenty-seven vizirs with portfolios, there were some titulary vizirs at court, like *Vizir i Huzur i Humayun* (minister of the imperial presence), *Vizir i makhsus* (extraordinary minister), &c., and a number in the provinces assisting the governors in the same way as the grand vizir assists the shah. Most of these ministers were abolished under the new constitution, and the heads of subsidiary departments are entitled *mudir* or *rais*, and are placed under the responsible ministers.

Religion.—About 9,000,000 of the population are Mahommedans of the Shiah faith, and 800,000 or 900,000, principally Kurds in north-western Persia, are said to belong to the other great branch of Islam, the Sunni, which differs from the former in religious doctrine and historical belief, and is the state religion of the Turkish Empire and other Mahommedan countries. Other religions are represented in Persia by about 80,000 to 90,000 Christians (Armenians, Nestorians, Greek Orthodox and Roman Catholics, Protestants), 36,000 Jews, and 9000 Zoroastrians.

Society in Persia, being based almost exclusively on religious law, is much as it was in Biblical times among the Jews, with this difference, however, that there exists no sacerdotal caste. In Persia any person capable of reading the Koran and interpreting its laws may act as a priest (*mullah*), and as soon as such a priest becomes known for his just interpretation of the *shar'* and his superior knowledge of the traditions and articles of faith, he becomes a *mujtahid*, literally meaning "one who strives" (to acquire knowledge), and is a chief priest. The *mullahs* are referred to in questions concerning religious law, hold religious assemblies, preach in mosques, teach in colleges, and are appointed by the government as judges, head-preachers, &c. Thus the dignitaries, whose character seems to us specially a religious one, are in reality doctors, or expounders and interpreters of the law, and officiating ministers charged with the ordinary accomplishment of certain ceremonies, which every other Mussulman, "true believer," has an equal right to fulfil. Formerly there were only four or five *mujtahids* in Persia, now there are many, sometimes several in one city—Teherān, for instance, has ten; but there are only a few whose decisions are accepted as final and without appeal. The highest authority of all is vested in the *mujtahid* who resides at Kerbela, or Nejef, near Bagdad, and is considered by many *Shi'ites* as the vicegerent of the Prophet and representative of the *imam*. The shah and the government have no voice whatever in the matter of appointing *mullahs* or *mujtahids*, but frequently appoint *sheikhs-ul-islam* and *cadis*, and occasionally chief priests of mosques that receive important subsidies out of government funds. The chief priest of the principal mosque of a city, the *masjid i jami'*, is called *imam juma'*, and he, or a representative appointed by him, reads the *khutba*, "Friday oration," and also preaches. The reader of the *khutba* is also called *khatib*. The leader of the prayers in a mosque is the *pishnamaz*, and the crier to prayers is the *mu'azzin*. Many priests are appointed guardians of shrines and tombs of members of the Prophet's family (*imams* and *imamzadehs*) and are responsible for the proper administration of the property and funds with which the establishments are endowed. The guardian of a shrine is called *mutavali*, or, if the shrine is an important one with much property and many attendants, *mutavali-bashi*, and is not necessarily an ecclesiastic, for instance, the guardianship of the great shrine of Imam Reza in Meshed is generally given to a high court functionary or minister as a reward for long services to the state. In the precincts of a great shrine a malefactor finds a safe refuge from his pursuers and is lodged and fed, and from the security of his retreat he can arrange the ransom which is to purchase his immunity when he comes out.

Formerly all cases, civil and criminal, were referred to the clergy, and until the 17th century the clergy were subordinate to a kind of chief pontiff, named *sadr-us-sadur*, who possessed a very extended jurisdiction, nominated the judges, and managed all the religious endowments of the mosques, colleges, shrines, &c. Shah Safi (1629–1642), in order to diminish the influence of the clergy, appointed two such pontiffs, one for the court and nobility the other for the people. Nadir Shah (1736–1747) abolished these offices altogether, and seized most of the endowments of the ecclesiastical establishments in order to pay his troops, and, the lands appropriated by him not having been restored, the clergy have never regained the power they once possessed. Many members of the clergy, particularly those of the higher ranks, have very liberal ideas and are in favour of progress and reforms so long as they are not against the *shar'*, or divine law; but, unfortunately, they form the minority.

The *Armenians* of Persia, in so far as regards their ecclesiastical state, are divided into the two dioceses of Azerbaijan and Isfahan, and, since the late troubles in Turkey, which caused many to take refuge in Persia, are said to number over 50,000. About three-fifths of this number belong to the diocese of Azerbaijan, with a bishop at Tabriz, and reside in the cities of Tabriz, Khoi, Selmas, Urmia and Maragha, and in about thirty villages close to the north-western frontier; the other two-fifths, under the diocese of Isfahan, with a bishop in Julfa, reside in Teherān, Hamadan, Julfa, Shiraz, Bushire, Resht, Enzeli and other towns, and in some villages in the districts of Chahar Mahal, Feridan, Barbarud, Kamareh, Kazaz, Kharakan, &c. Many Persian Armenians are engaged in trade and commerce, and some of

coast, Zanzibar, &c.; while the smaller vessels, called *bagarah*, and mostly under 20 tons, are employed in the coasting trade and the pearl-fisheries on the Arabian coast. It is estimated that the four principal ports and the many smaller ones (as Mashur, Hindian, Zaidin, Bander, Dilam, Rig, Kongan, Taheri, Kishm, Hormuz, &c.) possess at least 100 *baglahs* and several hundred *bagarahs*, besides a large number of small boats. The following figures from the commercial statistics published by the Persian Customs Department show the total shipping at the four principal Persian Gulf ports, Bushire, Bander Lingab, Bander Abbasi and Muhamrah during the years 1904–1907:—

	1904–1905.	1905–1906.	1906–1907.
	Tons.	Tons.	Tons.
British . . .	671,386	827,539	826,594
Persian . . .	36,797	25,069	6,425
Russian. . .	24,121	29,182	40,616
Arabian. . .	22,487	16,749	7,932
Turkish. . .	3,176	3,877	5,005
French . . .	2,901	570	—
German. . .	—	—	52,935
Total . .	760,868	902,986	939,507

The British shipping amounted to 89·2 % of the total shipping at the four ports during the years 1904–1907. There was no German shipping in the gulf before 1906, but in the first year of its appearance (1906–1907), its tonnage at the gulf ports was almost as much as that of all other nations with the exception of Great Britain.

The shipping of 1906–1907 was distributed among the four ports as follows:—

Bushire . . .	354,798 tons.	Bander Abbasi .	245,746 tons.
Bander Lingah	155,720 „	Muhamrah . . .	183,243 „

Bander Lingah, being the port where most of the pearls obtained on the Arabian coast of the gulf are brought to and exported from, has more native shipping (all sailing vessels) than the other ports.

All the shipping on the Caspian is under the Russian flag[1] and no returns of the arrivals and departures of vessels at the Persian ports were published before 1906. According to the statistics of the customs department the shipping of the Persian ports amounted in 1906–1907 to 650,727 tons. The shipping at the principal Persian ports on the Caspian in the year 1906–1907 was: Astara 137,935 tons; Enzeli 202,132 tons; Meshed i Sar 90,799 tons; Bander-I-Gez 56,135 tons. Two or three flat-bottomed sailing vessels navigate the lake of Urmia in north-western Persia, carrying merchandise, principally agricultural produce, from the western and south-western shores to the eastern for the supply of Tabriz. The navigation is a state monopoly, leased out for £250 per annum.

Coinage, Weights and Measures.—The monetary unit is the kran, a silver coin, formerly weighing 28 nakhods (88 grains), then reduced to 26 nakhods (77 grains), and now weighing only 24 nakhods (71 grains) or somewhat less. Before the new coinage came into use (1877) the proportion of pure silver was from 92 to 95 %; subsequently the proportion was for some time 90 %; now it is about 89½ %. In consequence of this depreciation of the coinage and the fall in the price of silver, partly also in consequence of exchange transactions by banks, the value of the kran has since 1895 rarely been more than 4·80d., or half what it was in 1874, and fell to less than 4d. in 1905. In 1874 the kran was worth a franc; in June 1908 the exchange for a £1 bill on London was 50 krans which gives the value of 1 kran as 4⅘d. Taking this value of the kran, the values of the various nickel and silver coins in circulation work out as:—

Nickel Coins.		Silver Coins.	
Shahi = 2 pul . .	0·24d.	Five shahis = ¼ kran .	1·20d.
Two shahis = 4 pul .	0·48d.	Ten shahis = ½ kran .	2·40d.
		One kran = 20 shahis = 40 pul	4·80d.
		Two krans	9·60d.

In 1899 from 80 to 83 copper shahis (weighing about ⅙ lb) were being given for one silver kran. This was owing to the depreciation of the copper coinage from 1896 onwards, consequent upon there being an excess of coinage due to the excessive quantities formerly put in circulation from the mint. Accordingly the government in 1900 replaced the copper by a nickel coinage (face value of nickel coin in circulation end of 1907, 4,000,000 krans). Accounts are kept in dinars, formerly a gold piece, now an imaginary coin $\frac{1}{1000}$ of a kran. Ten thousand dinars are equal to one *toman* (a word meaning ten thousand), or 10 krans silver, and 50 dinars are one shahi.

Gold coins are: ¼, ½, 1, 2, 5, and 10 toman pieces, but they are not in circulation as current money because of their ever-varying value in silver krans, which depends upon the exchange on London.

The unit of weight is the miskal (71 grains), subdivided into 24 nakhods (2·96 grains), a nakhod being further subdivided into 4 gandum (·74 grains). Larger weights, again, are the sir (16 miskals) and the abbasi, wakkeh, or kervankeh (5 sir). Most articles are bought and sold by a weight called batman, or man, of which there are several kinds, the principal being:—

Man-i-Tabriz = 8 abbasis	= 640 miskals	=	6·49 lb
Man-i-Noh abbasi = 9 abbasis	= 720 „	=	7·30 „
Man-i-Kohneh (the old man)	= 1000 „	=	10·14 „
Man-i-Shah = 2 Tabriz mans	= 1280 „	=	12·98 „
Man-i-Rey = 4 „ „	= 2560 „	=	25·96 „
Man-i-Bander abbasi	= 840 „	=	8·52 „
Man-i-Hashemi = 16 mans of	720 „	=	116·80 „

Corn, straw, coal, &c., are sold by kharvar = 100 Tabriz mans = 649 lb.

The unit of measure is the zar or gez, of which, as in the case of the man, there are several variants. 40·95 in. is the most common length for the zar, but in Azerbaijan the length is 44·09 in. Long distances are calculated in farsakhs, a farsakh being equal to 6000 zar. Probably the zar in this measure = 40·95 in., which makes the farsakh 3·87 m., but the other length of the zar is sometimes used, when the farsakh becomes 4·17 m. Areas are measured in jeribs of from 1000 to 1066 square zar of 40·95 in., the surface unit thus being from 1294 to 1379 sq. yds.

Constitution and Government.—Up to the year 1906 the government of Persia was an absolute monarchy, and resembled in its principal features that of the Ottoman Empire, with the exception, however, that the monarch was not the religious head of the community. The powers of the Shah (Shahanshah,[2] or "king of kings") over his subjects and their property were absolute, but only in so far as they were not opposed to the *shar'*, or "divine law," which consists of the doctrines of the Mahommedan religion, as laid down in the Koran, the oral commentaries and sayings of the Prophet, and the interpretations by his successors and the high priesthood. In 1905, however, the people began to demand judicial reforms, and in 1906 cried out for representative institutions and a constitution. By a rescript dated the 5th of August Muzaffar-ud-Dīn Shah gave his assent to the formation of a national council (*Majlis i shora i milli*), to be composed of the representatives of the various classes: princes, clergy, members of the Kajar family and tribe—chiefs and nobles, landowners, agriculturists, merchants and tradesmen. By an ordinance of the 10th of September the number of members was fixed at 162 (60 for Teherān, 102 for the provinces), to be raised to 200 if necessary, and elections were held soon after. Electors must be males and Persian subjects of not less than 25 years of age and of good repute. Landowners must possess land of at least 1000 tomans (£200) in value, merchants and tradesmen must have a fixed and well-known place of business or shop with an annual value of not less than the average values in the localities where they are established. Soldiers and persons convicted of any criminal offence are not entitled to vote. The qualifications for membership are knowledge of the Persian language and ability to read and write it and good repute in the constituency. No person can be elected who is an alien, is under the age of 30 years or over the age of 70 years, is in the employ of the government, is in the active service of the army or navy, has been convicted of any criminal offence, or is a bankrupt.

On the 7th of October the national council, or as many members of it as could be got together, was welcomed by the shah and elected a president. This was considered as the inauguration and formal opening of parliament. An ordinance signed

[1] By article v. of the Treaty of Gulistan of 1813, confirmed by article viii. of the Treaty of Turkmanchai of 1828, it was declared that Russia alone should have the right of maintaining vessels of war on the Caspian, and that no other Power should fly the military flag on that sea; and by a decision of the council of the Russian Empire, published on the 24th of November 1869, the establishment of companies for the navigation of the Caspian, except by Russian subjects, and the purchase of shares of such companies by foreigners were prohibited. (*Sta's Papers*, vol. lxiii. 925.)

[2] We see this title in its old Persian form, *Khshayathiya Khshayathiy*, in the cuneiform inscriptions; as Βασιλέως Βασιλέων on the coins of the Arsacides, and as the Pahlavi *Malkan Malka* on the coins and in the inscriptions of the Sassanians. With the Mahommedan conquest of Persia and the fall of the Sassanians the title was abolished; it was in use for a short time during the 10th century, having been granted to Shah Ismail Samani by the Caliph Motadid A.D. 900; it appeared again on coins of Nadir Shah, 1736–1747, and was assumed by the present dynasty, the Kajars, in 1799.

Justice.—By the theory of a Mahommedan state there should be no other courts of justice except those established for the administration of the *shar'*, the "divine or written law," but in Persia there is another judicature, which is called *'urf* and represents the "customary" or "known and unwritten law." Justice, therefore, is administered by the shah and his representatives according to one law and by the clergy according to another, but the decisions of the former must not be opposed to the fundamental doctrines of Islam. The shah's representatives for the administration of justice are the governors and other officers already mentioned. The officials charged with the administration of justice according to the *shar'* are judges, called *sheikh-ul-islam* and *kazi* (*kadhi*, *kadi* or *cadi* of Arabs and Turks), members of the clergy appointed by the government and receiving a fixed salary, but some cities are without regular appointed judges and the title of *cadi* is almost obsolete; decisions according to the *shar'* are given by all members of the clergy, ranging from ignorant *mullahs* of little villages and cantons to learned *mujtahids* of the great cities. If the parties to the suit are dissatisfied with the judgment, they may appeal to a priest who stands higher in public estimation, or one of the parties may induce a higher authority by bribery to quash the judgment of the first. Unfortunately, many members of the clergy are corrupt, but the *mujtahids*, as a rule are honest and entirely trustworthy. The functions of the representatives of the *shar'* are now limited to civil cases, while all criminal cases are referred to the *'urf*, which, however, also takes cognisance of civil disputes, should the parties desire it.

In criminal cases the dispensation of justice is always summary, and, when the offence is small, the whole procedure, including the examination of witnesses and criminal, as well as the decision and the punishment, a bastinado, is a matter of some minutes. For commercial cases, not paying a bill in time, bankruptcies, &c., a kind of jurisdiction is exercised by the minister of commerce, or a board of merchants, but the decisions of the minister, or those of the board, are rarely final. In Teherān the board of merchants is presided over by the *malik ut tujjar*, "King of Merchants," in the provincial cities by a person called *malik amin*, and *muin* of merchants.

After his second journey to Europe in 1878 Nasru 'd-Dīn Shah desired to organize a police for the whole of Persia on the European system, but only a small body of police, in the capital and its immediate neighbourhood, was created in 1879. Its strength is 60 mounted policemen and 190 foot, with 11 superior and 40 subaltern officers.

There is also a "Tribunal of the Ministry for Foreign Affairs," presided over at Teherān by an official of the foreign office, and in the provincial cities by the *karguzars*, "agents," of that department. The functions of this tribunal are to inquire into and judge differences and suits between Persian subjects and foreigners, and it is stipulated in the treaty of Turkmanchai, which is the basis of all existing treaties between Persia and other countries, that "such differences and suits shall only be examined and judgment given in the presence of the dragoman of the mission or consulate (of the foreign subject), and that, once judicially concluded, such suits shall not give cause to a second inquiry. If, however, circumstances should be of a nature to require a second inquiry, it shall not take place without previous notice given to the minister, or the chargé d'affaires, or the consul, and in this case the business shall only be preceded with at the supreme chancery of the shah at Tabriz or Teherān, likewise in the presence of a dragoman of the mission, or of the consulate." (Article vii.)

A foreign subject implicated in a criminal suit cannot be pursued or molested in any way unless there exist full proofs of his having taken part in the crime imputed to him, and should he be duly convicted of the crime, he is handed over to his legation, which either sends him back to his own country to undergo the punishment established by law, or, according to more recent usage, punishes him in Persia by fine, imprisonment, &c. In this respect the powers of the foreign representatives in Persia, now numbering ten (Great Britain, Russia, France, Turkey, Austria-Hungary, Germany, United States of America, Italy, Belgium and the Netherlands), vary considerably, some having the power of condemning a criminal to death, while others cannot do more than fine and imprison for short periods. Suits, civil and criminal, between foreign subjects are altogether out of Persian jurisdiction, and are judged by the representatives of the foreign powers accredited to Persia.

In 1889, after Nāsru 'd-Dīn Shah's return from his third visit to Europe, the council of state was instructed to compile a code of law for the regulation of justice. A beginning was made by ordering the translation of the Code Napoléon, the Indian Mahommedan code, and the Code Napoléon as modified for Algeria; but nothing further was done.

Finance.—The fixed revenues of Persia are derived from (1) regular taxation (*maliat*) composed of taxes on lands, flocks, herds, shopkeepers, artisans and trade; (2) revenues from Crown lands; (3) customs; (4) rents and leases of state monopolies. There is also a kind of irregular revenue derived from public requisitions, presents, fines, confiscations, &c., nowadays not producing much. The land tax, which varies according to localities, is paid in money and kind, and should amount on an average to about 25 % of the yield of the soil. The taxation on flocks and herds exists either as a supplementary method of land taxation, or as a contribution of a certain sum per animal, and the tax on shopkeepers, artisans and trades sometimes takes the form of a poll-tax, sometimes that of an impost on the profits of the trades. The revenue from Crown lands consists of a certain proportion of the produce, and also varies much according to localities. Until March 1899 all the customs were farmed out, but since then they have been organized on European principles, with the help of Belgian officials. By treaties with Russia and Great Britain, concluded in 1901 and 1903 respectively, the 5 % duty fixed by the Turkmanchai treaty was abolished, and an equitable tariff was established. The revenues from rents and leases of state monopolies are derived from posts, telegraphs, mines, mint, forests, banks, fisheries, factories, &c., and amount to about £110,000 per annum.

The total revenue of Persia, from all sources, amounted in 1876 to 58,700,000 krans, in 1884 to 50,800,000, in 1890 to 60,000,000; and in 1907–1908 to about 80,000,000 krans. This would seem to show a steady increase, but when we consider that the value of the kran in 1876 was nearly 8$\frac{9}{10}$d., and has fallen in consequence of the great depreciation of silver to only 4½d., the total revenue really decreased from £1,950,000 in 1876 to £1,600,000 in 1907-1908. Out of the actual total revenue £500,000 is represented by customs and £110,000 by rents and leases of state monopolies, leaving £990,000 for maliat and revenues of Crown lands. In 1876 the two latter items amounted to about £1,600,000, while the two former were only £350,000 instead of £610,000 in 1907–1908. While the prices in krans of agricultural produce, and hence the profits of the landowners and the wages and profits of artisans and tradesmen, were in 1907–1908 more than double what they were in 1876, the maliat, the backbone of the revenue, has hardly increased at all, being 50,000,000 krans (£1,000,000) against 43,200,000 krans (£1,600,000) in 1876, and showing a decrease of over 37 % in sterling money. A new assessment of the maliat, based upon the present value of the produce of lands and actual profits of artisans and tradesmen, has frequently been spoken of, and government, aided by a strong minister of the interior and an able minister of finance, ought to have no difficulty in raising the maliat to its proper level and the total revenues of the country to about two millions sterling.

Until 1888 the yearly expenditure was less than the yearly income, but subsequently the revenues were not sufficient to cover the expenditure, and many payments fell in arrear in spite of emptying the treasury of its reserve and contracting numerous loans.

In May 1892 the Persian government concluded a contract with the Imperial Bank of Persia, established by British royal charter in 1889, for a loan of £500,000 at 6 %, repayable in the course of forty years, and guaranteed by the customs of Fars and the Persian Gulf ports. The produce of this loan served for the payment of an indemnity to the Imperial Tobacco Corporation, which began in 1890 and had to cease its operations in January 1892. In January 1900 the Persian government, in order to pay the arrears and start afresh with a clear balance-sheet, contracted a loan through the Banque des Prêts de Perse, a Russian institution connected with the Russian state bank, and established in 1890. This loan was for 22½ million roubles (£2,400,000) at 5 % interest, guaranteed by all the Persian customs with the exception of those of Fars and the Persian Gulf ports, and repayable in the course of seventy-five years. In the contract, which was signed at St Petersburg at the end of January 1900, the Persian government undertook to redeem all its former foreign obligations (the 1892 loan) out of the proceeds of the new loan, and not to contract any other foreign loan before the redemption of the new loan without the consent of the Russian bank. The loan was at 86⅜, less 1⅜ for commission and charges, the Persian government thus receiving 85 % of the nominal capital, or £2,040,000. The bonds enjoy the full guarantee of the Russian government. The yearly charge for interest and amortization, about £124,000, is to be paid in two half-yearly instalments, and in the event of default the Russian bank will have the right to exercise effective control of the customs with a maximum number of twenty-five European employés. When the contract for the new loan was concluded, the liabilities of the Persian government for the balance of the 1892 loan (about £435,000), temporary loans from various banks, arrears of pays and salaries, and other debts, amounted to over £1,500,000, so that not much margin was left. The shah's visit to Europe in the same year cost the exchequer about £180,000. In March 1902 the Russian bank agreed to grant a further loan of 10 million roubles on the same conditions as those of the first loan, and the whole amount was paid by the end of the year, but another visit of the shah to Europe and reckless expenditure at home made the position worse than before. After November 1903 the expenditure was reduced, and the new customs tariff which came into force on the 14th of February 1903 increased the revenue by nearly £200,000 per annum; it was thought that the expenditure would not exceed the receipts, even if the shah undertook a third voyage in Europe (which he did in 1905). However, in November 1907, when the national assembly or council, demanded a budget and made inquiries as to the financial position, it was found that the expenditure for

some years past had been half a million sterling per annum in excess of the receipts and that considerable sums were owing to banks and commercial firms who had lent money. Most of the money borrowed is at 12 to 15 % interest.

Banking.—It was only in 1888 that a European bank (the New Oriental Bank Corporation, Limited) established itself in Persia and modern ideas of banking were introduced into the country. Until then the banking was done by the native money-changers (*sarrafs*) and some merchants—foreign and native—who occasionally undertook special outside transactions. In 1889 the shah granted a concession to Baron Julius de Reuter for the formation of a state bank with the exclusive right of issuing bank-notes—not exceeding £800,000 without special assent of the Persian government—on the basis of the local currency, the silver kran. With the title of "The Imperial Bank of Persia" the bank was formed in the autumn of the same year, and incorporated by royal charter granted by Queen Victoria and dated the 2nd of September 1889. The authorized capital was four millions sterling, but the bank started with a capital of one million, and began its business in Persia in October 1889. In April 1890 it took over the Persian business of the New Oriental Bank Corporation, soon afterwards opened branches and agencies at the principal towns, and issued notes in the same year. During the first two years the bank remitted the greater part of its capital to Persia at the then prevailing exchange, and received for every pound sterling 32 to 34 krans; but in consequence of the great fall in silver in 1893 and 1894, the exchange rose to 50 krans per pound sterling and more, and the bank's capital employed in Persia being reduced in value by more than one-third—100 krans, which at the beginning represented £3, then being worth only £2 or less—the original capital of one million sterling was reduced to £650,000 in December 1894. The bank has made steady progress in spite of innumerable difficulties, and paid a fair dividend to its shareholders. In his paper on "Banking in Persia" (*Journal of the Institute of Bankers*, 1891), Mr Joseph Rabino pointed out the great difficulties which make the easy distribution of funds—that is, the providing them when and where required—a matter of impossibility in Persia, and gives this fact as the reason why the Imperial Bank of Persia has local issues of notes, payable at the issuing branches only, "for, in a country like Persia, where movements of specie are so costly, slow and difficult as to become impracticable except on a small scale, the danger of issuing notes payable at more than one place is obvious." On the 20th of September 1907 the value of the notes in circulation was £395,000, and the bank held £550,000 deposits in Persia.

In 1889 the shah also granted a concession to Jaques de Poliakov of St Petersburg for the establishment of a "loan bank," or, as the original concession said, "mont-de-piété," with exclusive rights of holding public auctions. A company was formed in the same year and started business at Teherān in 1890 as the "Banque des Prêts de Perse." After confining its operations for some years to ordinary pawnbroking, without profits, it obtained the aid of the Russian State Bank, acquired large premises in Teherān, made advances to the Persian government (since 1898), and in January 1900 and March 1902 financed the loans of £2,400,000 and £1,000,000 to Persia. It has branches at Tabriz, Resht, Meshed and other places.

Various Armenian firms, one with branches at many places in Persia and Russia, also do banking business, while various European firms at Tabriz, Teherān, Isfahan, Shiraz and Bushire, facilitate remittances between Europe and Persia.

The chief business of the native *sarrafs* (money-changers, bankers, &c.) is to discount bills at high rates, hardly ever less than 12 %, and remit money from place to place in Persia for a commission amounting to from 1 to 5, or even 6 % on each transaction; and in spite of the European banks giving lower rates of discount and remitting money at par, the majority of the people and mercantile classes still deal with the natives. For advances with good security a native *sarraf* charges at least 12 % interest per annum; as the security diminishes in value the rate of interest increases, and transactions at 10 % a month, or more than 120 % per annum, are not infrequent. A Persian who obtains an advance of money at less than 12 % considers that he gets money "for nothing."

(A. H.-S.)

History

A.—*Ancient, to the Fall of the Sassanid Dynasty.*

I. *The Name.*—"Persia," in the strict significance of the word, denotes the country inhabited by the people designated as Persians, *i.e.* the district known in antiquity as Persis (*q.v.*), the modern Fars. Custom, however, has extended the name to the whole Iranian plateau; and it is in this sense that the term Persia is here employed.

II. *Ancient Ethnography.*—In historical times we find the major portion of Iran occupied by peoples of Indo-European origin, terming themselves Aryans (*Arya*; Zend, *Airya*) and their language Aryan—so in the inscriptions of Darius—the same name, which is used by the consanguineous tribes of India who were their nearest relations. The whole country is designated Ariana (Zend, *Airyana*)—"the land of the Aryans"—the original of the Middle-Persian *Eran* and the modern *Iran*; the Greek geographers Eratosthenes and Strabo were in error when they limited the name to the eastern districts of Iran. Thus the name of Iranians is understood to comprehend all these people of Aryan nationality.

Descent of the Iranians.

Besides the Iranians, numerous tribes of alien origin were found in Iran. In Baluchistan, even yet, we find side by side with the eponymous Iranian inhabitants, who only penetrated thither a few centuries ago, the ethnologically and philologically distinct race of the Brahui, who are probably connected with the Dravidians of India. In them we may trace the original population of these districts; and to the same original population may be assigned the tribes here settled in antiquity: the Paricanii and Gedrosii (Gadrosii), and the Myci (Herod. iii. 93, vii. 68; the *Maka* of Darius, the modern *Mekran*), to whom the name "Aethiopians" is also occasionally applied (Herod. iii. 94, vii. 70). In Media the Greek geographers mention a people of Anariacae (Strabo xi. 508, 514; Pliny, *Nat. Hist.* vi. 48; Ptolem. vi. 25; in Polyb. v. 44. 9, Ἀνιαράκαι), *i.e.* "Non-Aryans." To these the Tapuri, Amardi, Caspii, and especially the Cadusii or Gelae—situated in Ghilan on the Caspian—probably belonged. Presumably they were also related to the tribes of Armenia and the Caucasus. In the chains of Zagros we find, in Babylonian and Assyrian times, no trace of Iranians; but partly Semitic peoples—the Gutaeans, Lulubaeans, &c.—partly tribes that we can refer to no known ethnological group, *e.g.* the Cossaei (see below), and in Elymais or Susiana the Elymaeans (Elamites).

Alien Tribes in Iran.

That the Iranians must have come from the East to their later home, is sufficiently proved by their close relationship to the Indians, in conjunction with whom they previously formed a single people, bearing the name *Arya*. Their residence must have lain chiefly in the great steppe which stretches north of the Black Sea and the Caspian, through South Russia, to Turan (Turkestan) and the Oxus and Jaxartes. For here we continually discover traces of Iranian nationality. The names and words of the Scythians (*Scoloti*) in South Russia, which Herodotus has preserved, are for the most part perfectly transparent Iranian formations, identified by Zeuss and Müllenhoff; among them are many proper names in *Aria*-(Αρια-) and *aspa* (-horse-ασπος; Zend, *aspa*). The predatory tribes of Turan (*e.g.* the Massagetae) seem to have belonged to the same stock. These tribes are distinguished by the Iranian peasants as Daha (Gr. Δάαι), "enemies," "robbers"; by the Persians as Sacae; and by the Greeks generally as Scythians.

Iranians and Aryan Indians.

From the region of the steppes the Aryans must have penetrated into the cultivable land of Eastern Iran: thence one part spread over the district of the Indus, then on again to the Ganges; another moved westward to Zagros and the borders of the Semitic world.

The date of this migration cannot yet be determined with certainty. We know only that the Aryans of India already occupied the Punjab in the Vedic era, *c.* 1600 B.C. On the other hand, about the same period a number of names, undoubtedly Iranian, made their appearance in Western Asia, (cf. Edward Meyer, "Zur ältesten Geschichte der Iranier," in *Zeitschrift für vergleichende Sprachforschung*, 1907). In the cuneiform letters from Tell el-Amarna in Egypt (1400 B.C.), we find among the princelings of Syria and Palestine names like *Artamanya*, *Arzawiya*, *Shuwardata*, a name terminating in *-warzana*, &c.; while the kings of Mitanni on the Euphrates are *Artatama*, *Shutarna*, *Artashumara*, and *Dushratta*—names too numerous and too genuinely Iranian to allow of the hypothesis of coincidence. Later still, in the Assyrian inscriptions we occasionally meet with Iranian names borne by North-Syrian princes—*e.g.* Kundaspi and

Period of the Iranian Migration.

Kustaspi (=Hystaspis). Their subjects, on the contrary, speak absolutely different tongues: for the attempts to explain the languages of the Cossaeans, Mitannians, and Arzapians as Indo-European (Iranian) have ended in failure (cf. Blomfield in the *American Journal of Philology*, xxv. 1 sqq.).

It appears, then, that towards the middle of the second millennium before Christ, the Iranians made a great forward movement to the West, and that certain of their princes—at first, probably in the rôle of mercenary leaders, reached Mesopotamia and Syria and there founded principalities of their own, much as did the Germans under the Roman Empire, the Normans, Turks, &c. With this we may probably connect the well-known fact that it was about this very period (1700 B.C. approximately) that the horse made its appearance in Babylonia, Egypt and Greece, where for centuries subsequently its use was confined to war and the war-chariot. Before this it was as foreign to the Babylonians, even in the time of Khammurabi, as to the Egyptians under the XIIth Dynasty. On the other hand, it had been familiar to the Aryans from time immemorial: indeed they have always been peculiarly a people of riders. Thus it is quite conceivable that they brought it with them into Western Asia: and the quarter from which it came is sufficiently indicated by the fact that the Babylonians write the word "horse" with a group of signs denoting "ass of the East."

Of the Assyrian kings, Shalmaneser (Salmanassar) II. was the first to take the field against the Medes in 836 B.C., and from that period onwards they are frequently mentioned in the Assyrian annals. Sargon penetrated farthest, receiving in 715 B.C. the tribute of numerous Median town-princes. He gives a list of their names, twenty-three of which are preserved either wholly or in part, and almost all are unmistakably Iranian; as is also the case with those preserved by Esar-haddon (Assarhaddon) and elsewhere.

The Medes, then, were an Iranian nation, already occupying in the 9th century B.C. their later home in the centre of the Median highland. On the other hand, among their neighbours in Zagros and the north—corresponding to the Anariacae (Non-Aryans) of the Greeks—Iranian names are at best isolated phenomena. With other Iranian tribes the Assyrians never came in contact: for the oft-repeated assertion, that the Parsua, so prominent in their annals, were the Persians or the Parthians, is quite untenable. The Parsua of the Assyrians are located south of Lake Urmia, and can hardly have been Iranians.

None the less, the Assyrian statements with regard to the Medes demonstrate that the Iranians must have reached the west of Iran before 900 B.C. It is probable that at this period the Persians also were domiciled in their later home, even though we have no direct evidence to adduce. If this reasoning is correct, the Iranian immigration must be assigned to the first half of the second pre-Christian millennium.

The Aryans of Iran are divided into numerous tribes; these, again, being subdivided into minor tribes and clans. The principal, according to the inscriptions of Darius —which closely agree with Herodotus—are the following, several of them being also enumerated in the *Avesta*:—

Tribes of the Iranians.

1. The Medes (*Mada*) in the north-west (see MEDIA).
2. The Persians (*Parsa*) in the south (see PERSIS). To these belong the Carmanians and the Utians (*Yutiya*), who are mentioned expressly by Darius as inhabiting a district in Persis (*Beh.* III. 40).
3. The Hyrcanians (*Varkāna* in Darius, Zend *Vehrkāna*) on the eastern corner of the Caspian, in the fertile district of Astarabad.
4. The Parthians (*Parthyaei*; Pers. *Parthava*) in Khorasan (see PARTHIA).
5. The Arians (Ἀρεῖοι, Pers. *Haraiva*), in the vicinity of the river Arius (*Heri-rud*), which derived its name from them. This name, which survives in the modern Herat, has of course no connexion with that of the Aryans.
6. The Drangians (*Zaranka* in Darius, *Sarangians* in Herod. iii. 93, 117, vii. 67), situated south of the Arians, in the north-west of Afghanistan (*Arachosia*) by the western affluents of Lake Hamun, and extending to the present Seistan.
7. Arachotians (Pers. *Harauvati*), in the district of the Helmand and its tributaries, round Kandahar. They are mentioned in the lists of Darius, also by the Greeks after Alexander. In Herodotus their place is taken by the Pactyans, whose name survives to the present day in the word *Pushtu*, with which the Afghans denote their language (Herod. iii. 102, iv. 44, vii. 67, 85). Probably it was the old tribal name; Arachosia being the local designation. The Thamanaeans, who appear in Herodotus (iii. 93, 117), must be classed with them.
8. The Bactrians (Pers. *Bākhtri*), on the northern declivity of the Hindu-Kush, as far as the Oxus. Their capital was Bactra, the modern *Balkh* (see BACTRIA).
9. The Sogdians (Pers. *Sugudu*), in the mountainous district between the Oxus and Jaxartes.
10. The Chorasmians (Khwarizmians, Pers. *Uvarazmiya*), in the great oasis of Khiva, which still bears the name Khwarizm. They stretched far into the midst of the nomadic tribes.
11. The Margians (Pers. *Margu*), on the river Margus (Murghab); chiefly inhabiting the oasis of Merv, which has preserved their name. Darius mentions the district of Margu but, like Herodotus, omits them from his list of peoples; so that ethnographically they are perhaps to be assigned to the Arians.
12. The Sagartians (Pers. *Asagarta*); according to Herodotus (vii. 85), a nomadic tribe of horsemen; speaking, as he expressly declares, the Persian language. Hence he describes them (i. 125) as a subordinate nomad clan of the Persians. They, with the Drangians, Utians and Myci, formed a single satrapy (Herod. iii. 93). Ptolemy (vi. 2, 6) speaks of Sagartians in the Eastern Zagros in Media.
13. We have already touched on the nomadic peoples (*Dāha*, *Dahans*) of Iranian nationality, who occupied the steppes of Turkestan as far as the Sarmatians and Scythians of South Russia. That these were conscious of their Aryan origin is proved by the names Ariantas and Ariapeithes borne by Scythian (Scolot) kings (Herod. iv. 76, 87). Still they were never counted as a portion of Iran or the Iranians. To the settled peasantry, these nomads of the steppe were always "the enemy" (*dana*, *daha*, Δάαι, Dahae). Side by side with this name we find "Tūrān" and "Turanian"; a designation applied both by the later Persians and by modern writers to this region. The origin of the word is obscure, derived perhaps from an obsolete tribal name. It has no connexion whatever with the much later "Turks," who penetrated thither in the 6th century after Christ. Though found neither in the inscriptions of Darius nor in the Greek authors, the name Turan must nevertheless be of great antiquity; for not merely is it repeatedly found in the *Avesta*, under the form *Tura*, but it occurs already in a hymn, which, without doubt, originates from Zoroaster himself, and in which "the Turanian Fryāna" and his descendants are commemorated as faithful adherents of the prophet (*Yasna*, 46, 62).

The dividing line between Iranian and Indian is drawn by the Hindu-kush and the Soliman mountains of the Indus district. The valley of the Kabul (*Cophen*) is already occupied by Indian tribes, especially the Gandarians; and the Satagydae (Pers. *Thatagu*) there resident were presumably also of Indian stock. The non-Aryan population of Iran itself has been discussed above. Of its other neighbours, we must here mention the Sacae, a warlike equestrian people in the mountains of the pamir plateau and northward; who are probably of Mongol origin. Herodotus relates that the Persians distinguished "all the Scythians"—*i.e.* all the northern nomads—as Sacae; and this statement is confirmed by the inscriptions of Darius. The Babylonians employ the name Gimiri (*i.e.* Cimmerians) in the same sense.

III. *Civilization and Religion of the Iranians.*—In the period when the ancestors of Indian and Iranian alike still formed a single nation—that of the Aryans—they developed a very marked character, which can still be distinctly traced, not only in their language, but also in their religion and in many views common to both peoples. A great number of gods—Asura, Mithras, the Dragon-slayer Verethraghna (the Indra of the Indians), the Water-shoot Apam napat (the lightning), &c.—date from this era. So, too, fire-worship, especially of the sacrificial flame; the preparation of the intoxicating *soma*, which fills man with divine strength and uplifts him to the gods; the injunction to "good thoughts and good works," imposed on the pious by Veda and Avesta alike: the belief in an unwavering order (*rta*)—a law controlling gods and men and dominating them all; yet with this, a belief in the power of magical formulae (*mantra*), exclamations and prayers, to whose compulsion not merely demons (the evil spirits of deception—*druh*) but even the gods (*daeva*) must submit; and, lastly, the institution of a priesthood of fire-kindlers (*athravan*), who are at once the repositories of all sacral traditions and the mediators in all intercourse between earth and heaven. The transition, moreover, to settled life and agriculture belongs to the Aryan

Aryan Religion.

period; and to it may be traced the peculiar sanctity of the cow in India and Persia. For the cow is the animal which voluntarily yields nourishment to man and aids him in his daily labours, and on it depends the industry of the peasant as contrasted with the wild desert brigand to whom the cow is unknown.

Very numerous are the legends common to both nations. These, in part, are rooted in the primeval Indo-European days, though their ultimate form dates only from the Aryan epoch. Foremost among them is the myth relating the battle of a sun-god (Ind. *Trita*, generally replaced by *Indra*, Iran. *Thraetona*) against a fearful serpent (Ind. *Ahi*, Iran. *Azhi*; known moreover as *Vrtra*): also, the legend of Yama, the first man, son of Vivasvant, who, after a long and blessed life in the happy years of the beginning, was seized hy death and now rules in the kingdom of the departed. Then come a host of other tales of old-world heroes; as the "Glorious One" (Ind. *Sushrava*, Pers. *Husrava*, *Chosrau* or *Chosroes*), or the Son who goes on a journey to seek his father, and, unknown, meets his end at his hands.

The Iranian Saga.

These legends have lived and flourished in Iran at every period of its history; and neither the religion of Zoroaster, nor yet Islam, has availed to suppress them. Zoroastrianism—at least in that form in which it became the dominant creed of the Iranians—legitimized not only the old gods, but the old heroes also; and transformed them into pious helpers and servants of Ahuramazda; while the creator of the great national epic of Persia, Firdousi (A.D. 935–1020), displayed astonishing skill in comhining the ancient tradition with Islam. Through his poem, this tradition is perfectly familiar to every Persian at the present day; and the primitive features of tales, whose origin must be dated 4000 years ago, are still preserved with fidelity. This tenacity of the Saga stands in the sharpest contrast with the fact that the historical memory of the Persian is extremely defective. Even the glories of the Achaemenid Empire faded rapidly, and all but completely, from recollection; so also the conquest of Alexander, and the Hellenistic and Parthian eras. In Firdousi, the legendary princes are followed, almost without a break, by Ardashir, the founder of the Sassanid dynasty: the intervening episode of Darius and Alexander is not drawn from native tradition, but borrowed from Greek literature (the Alexander-romance of the Pseudo-Callisthenes) in precisely the same way as among the nations of the Christian East in the middle ages.[1]

Needless to say, however, this long period saw the Saga much recast and expanded. Many new characters—Siyawush, Rustam, &c.—have swelled the original list: among them is King Gushtasp (Vishtaspa), the patron of Zoroaster, who was known from the poems of the prophet and is placed at the close of the legendary age. The old gods and mythical figures reappear as heroes and kings, and their battles are fought no longer in heaven but upon earth, where they are localized for the most part in the east of Iran. In other words, the war of the gods has degenerated to the war between Iranian civilization and the Turanians. Only the evil serpent Azhi Dahaka (Azhdahak) is domiciled by the *Avesta* in Babylon (*Bawri*) and depicted on the model of Babylonian gods and demons: he is a king in human form with a serpent growing from either shoulder and feeding on the brains of men. In these traits are engrained the general conditions of history and culture, under which the Iranians lived: on the one hand, the contrast between Iranian and Turanian; on the other, the dominating position of Babylon, which influenced most strongly the civilization and religion of Iran. It is idle, however, to read definite historical events into such traits, or to attempt, with some scholars, to convert them into history itself. We cannot deduce from them a conquest of Iran from Babylon: for the Babylonians never set foot in Iran, and even the Assyrians merely conquered the western portion of Media. Nor yet can we make the favourite assumption of a great empire in Bactria. On the contrary, it is historically evident that before the Achaemenids there were in Bactria only small local principalities of which Vishtaspa's was one: and it is possible that the primeval empire of the Saga is only a reflection of the Achaemenid and Sassanid empires of reality, whose existence legend dates back to the beginning of the world, simply because legend is pervaded by the assumption that the conditions obtaining in the present are the natural conditions, and, as such, valid for all time.

Difference between the Iranian and Indian Religion.

Closely connected as are the Mythology and Religion of Indian and Iranian, no less clearly marked is the fundamental difference of intellectual and moral standpoint, which has led the two nations into opposite paths of history and culture. The tendency to religious thought and to a speculative philosophy, comprehending the world as a whole, is shared by both and is doubtless an inheritance from the Aryan period. But with the Indians this speculation leads to the complete abolition of all barriers between God and man, to a mystic pantheism, and to absorption in the universal Ego, in contrast with which the world becomes an unsubstantial phantasm and sinks into nothingness. For the Iranian, on the contrary, practical life, the real world, and with them the moral commandment, fill the foreground. The new gods created by Iran are ethical powers; those of India, abstractions of worship (*brahman*) or of philosophy (*atman*). These fundamental features of Iranian sentiment encounter us not only in the doctrine of Zoroaster and the confessions of Darius, but also in that magnificent product of the Persia of Islam—the Sufi mysticism. This is pantheistic, like the Brahman philosophy. But the pantheism of the Persian is always positive,—affirming the world and life, taking joy in them, and seeking its ideal in union with a creative god: the pantheism of the Indian is negative—denying world and life, and descrying its ideal in the cessation of existence.

This contrast in intellectual and religious life must have developed very early. Probably, in the remote past violent religious disputes and feuds broke out: for otherwise it is almost inexplicable that the old Indo-European word, which in India, also, denotes the gods—*deva*—should be applied by the Iranians to the malignant demons or devils (*daeva*; mod. *div*); while they denote the gods by the name *bhaga*. Conversely the Asuras, whose name in Iran is the title of the supreme god (*ahura*, *aura*), have in India degenerated to evil spirits. It is of great importance that among the Slavonic peoples the same word *bogu* distinguishes the deity; since this points to ancient cultural influences on which we have yet no more precise information. Otherwise, the name is only found among the Phrygians, who, according to Hesychius, called the Heaven-god (Zeus) Bagaeus; there, however, it may have been borrowed from the Persians. We possess no other evidence for these events; the only document we possess for the history of Iranian religion is the sacred writing, containing the doctrines of the prophet who gave that religion a new form. This is the *Avesta*, the Bible of the modern Parsee, which comprises the revelation of Zoroaster.

Zoroaster.

As to the home and time of Zoroaster, the Parsee tradition yields us no sort of information which could possibly be of historical service. Its contents, even if they go back to lost parts of the *Avesta*, are merely a late patchwork, based on the legendary tradition and devoid of historical foundation. The attempts of West (*Pahlavi Texts Translated*, vol. v.) to turn to historical account the statements of the *Bundahish* and other Parsee books, which date Zoroaster at 258 years before Alexander, are, in the present writer's opinion, a complete failure. Jackson (*Zoroaster, the Prophet of Ancient Iran*, 1901) sides with West. The Greek theory, which relegates Zoroaster to the mists of antiquity, or even to the period of the fabulous Ninus and Semiramis, is equally valueless. Even the statement that he came from the north-west of Media (the later Atropatene), and his mother from Rai (Rhagae) in eastern Media, must be considered as problematic in the extreme. Our only trustworthy information is to be gleaned from his own testimony and from the history of his religion. And here we may take it as certain that the scene of his activity was laid in

[1] The fundamental work on the history of the Iranian Saga is Nöldeke, *Das iranische Nationalepos 1896* (reprinted from the *Grundriss der iran. Philologie*, ii.).

the east of Iran, in Bactria and its neighbouring regions. The contrasts there existing between peasant and nomad is of vital consequence for the whole position of his creed. Among the adherents whom he gained was numbered, as already mentioned, a Turanian, one Fryana and his household. The west of Iran is scarcely ever regarded in the *Avesta*, while the districts and rivers of the east are often named. The language, even, is markedly different from the Persian; and the fire-priests are not styled Magians as in Persia—the word indeed never occurs in the *Avesta*, except in a single late passage—but *athravan*, identical with the *atharvan* of India (πύραιθοι, "fire-kindlers," in Strabo xv. 733). Thus it cannot be doubted that the king Vishtaspa, who received Zoroaster's doctrine and protected him, must have ruled in eastern Iran: though strangely enough scholars can still be found to identify him with the homonymous Persian Hystaspes, the father of Darius. The possibility that Zoroaster himself was not a native of East Iran, but had immigrated thither (from Rhagae ?), is of course always to be considered; and this theory has been used to explain the phenomenon that the Gathas, of his own composition, are written in a different dialect from the rest of the *Avesta*. On this hypothesis, the former would be his mother-tongue: the latter the speech of Eastern Iran.

This district is again indicated as the starting-point of Zoroastrianism, by the fact that dead bodies are not embalmed and then interred, as was usual, for instance, in Persia, but cast out to the dogs and birds (cf. Herod. i. 140), a practice, as is well known, strictly enjoined in the *Avesta*, ruthlessly executed under the Sassanids, and followed to the present day by the Parsees. The motive of this, indeed, is to be found in the sanctity of Earth, which must not be polluted by a corpse; but its origin is evidently to be traced in a barbaric custom of nomadic or semi-nomadic tribes who leave the dead to lie on the steppe; and we know from Greek sources that this custom was widely diffused among the tribes of eastern Iran.

The next clue towards determining the period of Zoroaster is, that Darius I. and all his successors, as proved by their inscriptions and by Greek testimony, were zealous adherents of the pure word of Zoroastrianism; which consequently must already have been accepted in the west of Iran. That Cyrus too owned allegiance to the creed, cannot be doubted by an unprejudiced mind, although in the dearth of contemporary monuments we possess no proof at first hand. The Assyrian inscriptions demonstrate, however, that Zoroaster's teaching was dominant in Media two centuries before Cyrus. For in the list of Median princes, to which we have already referred, are two bearing the name of Mazdaka—evidently after the god Mazda. Now this name was the invention of Zoroaster himself; and he who names himself after Mazda thereby makes a confession of faith in the religion of Zoroaster whose followers, as we know, termed themselves Mazdayasna, "worshippers of Mazda."

Thus, if the doctrine of Zoroaster predominated in Media in 714 B.C., obviously his appearance in the rôle of prophet must have been much earlier. A more definite date cannot be deduced from the evidence at our disposal, but his era may safely be placed as far back as 1000 B.C.

The religion which Zoroaster preached was the creation of a single man, who, having pondered long and deeply the problems of existence and the world, propounded the solution he found as a divine revelation. Naturally he starts from the old views, and is indebted to them for many of his tenets and ideas; but out of this material he builds a uniform system which bears throughout the impress of his own intellect. In this world, two gronps of powers confront each other in a truceless war, the powers of Good, of Light, of creative Strength, of Life and of Truth, and the powers of Evil, of Darkness, Destruction, Death and Deceit. In the van of the first stands the Holy Spirit (*spenta mainyu*) or the "Great Wisdom" Mazdao. His helpers and vassals are the six powers of Good Thought (*vohu manō*, 'Ωμανός), of Right Order (*asha*, Ind. *rta*, Pers. *arta*, "lawfulness"), of the Excellent Kingdom (*hhshathra vairya*), of Holy Character (*spenta ārmaiti*), of Health (*haurvatāt*), and of Immortality (*ameretat*). These are comprised under the general title of "nndying holy ones" (*amesha spenta, amshaspand*); and a host of subordinate angels (*yasata*) are ranked with them. The powers of evil are in all points the opposite of the good; at their head being the Evil Spirit (*angra mainyu, Ahriman*). These evil demons are identical with the old gods of the popular faith—the devas (div)—while Mazdao bears the name *Ahura*, above discussed; whence *Ahuramazda* (Ormuzd).

From this it will be manifest that the figures of Zoroaster's religion are purely abstractions; the concrete gods of vulgar belief being set aside. All those who do not belong to the devils (*devas*), might be recognized as inferior servants of Ahuramazda: chief among them being the Sun-god Mithras (see MITHRAS); the goddess of vegetation and fertility, especially of the Oxus-stream, *Anāhita Ardvisura* (*Anaitis*); and the Dragon-slayer *Verethraghna* (Gr. *Artagnes*), with the god of the intoxicating *Haoma* (the Indian Soma). In the religion of the people, these divinities always survived; and the popularity of Mithras is evinced by the numerous Aryan proper names thence derived (Mithradates, &c.). The educated community who had embraced the pure doctrine in its completeness scarcely recognized them, and the inscriptions of Darius ignore them. Only once he speaks of "the gods of the clans," and once of "the other gods which there are." Not till the time of Artaxerxes II. were Mithra and Anaitis received into the official religion of the Persian kings. But they always played a leading part in the propaganda of the Persian cults in the West.

Only one element in the old Aryan belief was preserved by Zoroaster in all its sanctity: that of Fire—the purest manifestation of Ahuramazda and the powers of Good. Thus fire-altars were everywhere erected; and, to the prophet also, the Fire-kindlers (*āthravan*) were the ministers and priests of the true religion and the intermediaries between God and man; at last in the popular mind, Zoroastrianism was identified with Fire-worship pure and simple, —inadequate though the term in reality is, as a description of its essentials.

Midway in this opposition of the powers of Good and Evil, man is placed. He has to choose on which side he will stand: he is called to serve the powers of Good: his duty lies in speaking the truth and combating the lie. And this is fulfilled when he obeys the commands of law and the true order; when he tends his cattle and fields, in contrast with the lawless and predatory nomad (Dahae); when he wars on all harmful and evil creatures, and on the devil-worshippers; when he keeps free from pollution the pure creations of Ahuramazda—fire foremost, but also earth and water; and, above all, when he practises the Good and True in thought, word and work. And as his deeds are, so shall be his fate and his future lot on the Day of Judgment; when he must cross the Bridge *Cinvat*, which, according to his works, will either guide him to the Paradise of Ahuramazda or precipitate him to the Hell of Ahriman. Obviously, it was through this preaching of a judgment to come and a direct moral responsibility of the individual man, that, like Mahomet among the Arabs, Zoroaster and his disciples gained their adherents and exercised their greatest influence.

In this creed of Zoroastrianism three important points are especially to be emphasized: for on them depend its peculiar characteristics and historical significance:—

1. The abstractions which it preaches are not products of metaphysical speculation, as in India, but rather the ethical forces which dominate human life. They impose a duty upon man, and enjoin on him a positive line of action—a definite activity in the world. And this world he is not to eschew, like the Brahman and the Buddhist, but to work in it, enjoying existence and life to the full. Thus a man's birthday is counted the highest festival (Herod. i. 133); and thus the *joie de vivre*, rich banquets and carousals are not rejected by the Persian as godless and worldly, but are even prescribed by his religion. To create offspring and people the world with servants of Ahuramazda is the duty of every true believer.[1]

2. This religion grew up in the midst of a settled peasant population, whose mode of life and views it regards as the natural disposition of things. Consequently, it is at once a product of, and a main factor in civilization; and is thereby sharply differentiated from the Israelite religion, with whose moral precepts it otherwise coincides so frequently.

3. The preaching of Zoroaster is directed to each individual man, and requires of him that he shall choose his position with regard to the fundamental problems of life and religion. Thus, even though it arose from national views, in its essence it is not national (as, for instance, the Israelite creed), but individualistic, and at the same time universal. From the first, it aims at propaganda; and the nationality of the convert is a matter of indifference. So Zoroaster himself converted the Turanian Fryana with his kindred (see above); and the same tendency to proselytize alien peoples survived in his religion. Zoroastrianism, in fact, is the first creed to work by missions or to lay claim to universality of acceptance. It was, however, only natural that its adherents should be won, first and chiefly, among the countrymen of the prophet, and its further success in gaining over all the Iranian tribes gave it a national stamp. So the Susan translation of Darius' Behistun inscription

[1] These ideas are strongly exposed in a polemic against the Christians contained in an official edict of the Persian creed to the Armenians by Mihr Narseh, the vizier of Yazdegerd II. (about A.D. 450), preserved by the Armenian historian, Elishe.

terms Ahuramazda "the god of the Aryans." Thus the creed became a powerful factor in the development of an united Iranian nationality.

That a religion, which lays its chief stress upon moral precepts, may readily develop into casuistry and external formalism, with an infinity of minute prescriptions, injunctions on purity and the like, is well known. In the *Avesta* all these recur *ad nauseam*, so much so that the primitive spirit of the religion is stifled beneath them, as the doctrine of the ancient prophets was stifled in Judaism and the Talmud. The Sassanid Empire, indeed, is completely dominated by this formalism and ritualism; but the earlier testimony of Darius in his inscriptions and the statements in Herodotus enable us still to recognize the original healthy life of a religion capable of awakening the enthusiastic devotion of the inner man. Its formal character naturally germinated in the priesthood (Herod. i. 140; cf. Strabo xv. 733, &c.). The priests diligently practise all the precepts of their ritual—*e.g.* the extermination of noxious animals, and the exposure of corpses to the dogs and birds, that earth may not be polluted by their presence. They have advice for every contingency in life, and can say with precision when a man has been defiled, and how he may be cleansed again; they possess an endless stock of formulae for prayer, and of sentences which serve for protection against evil spirits and may be turned to purposes of magic.

The Magians.

How the doctrine overspread the whole of Iran, we do not know. In the West, among the Medes and Persians, the guardianship and ministry of Zoroastrianism is vested in an exclusive priesthood—the Magians. Whence this name—unknown, as already mentioned, to the *Avesta*—took its rise, we have no knowledge. Herodotus (i. 101) includes the Magians in his list of Median tribes; and it is probable that they and their teaching reached the Persians from Media. At all events, they play here not merely the rôle of the "Fire-kindlers" (*āthravan*) in the *Avesta*, but are become an hereditary sacerdotal caste, acting an important part in the state—advisers and spiritual guides to the king, and so forth. With them the ritualism and magical character, above mentioned, are fully developed. In the narrations of Herodotus, they interpret dreams and predict the future; and in Greece, from the time of Herodotus and Sophocles (*Oed. Tyr.* 387) onward, the word *Magian* connotes a magician-priest.

Assyrian Conquest of Media.

IV. *Beginnings of History.*—A connected chain of historical evidence begins with the time when, under Shalmaneser (Salmanassar II.), the Assyrians in 836 B.C. began for the first time to penetrate farther into the mountains of the east; and there, in addition to several non-Iranian peoples, subdued a few Median tribes. These wars were continued under successive kings, till the Assyrian power in these regions attained its zenith under Sargon (*q.v.*), who (715 B.C.) led into exile the Median chief Dayuku (see DEIOCES), a vassal of the Minni (Mannaeans), with all his family, and subjected the princes of Media as far as the mountain of Bikni (Elburz) and the border of the great desert. At that time twenty-eight Median "town-lords" paid tribute to Nineveh; two years later (713 B.C.), no fewer than forty-six. Sargon's successors, down to Assur-bani-pal (668–626 B.C.), maintained and even augmented their suzerainty over Media, in spite of repeated attempts to throw off the yoke in conjunction with the Mannaeans, the Saparda, the Cimmerians—who had penetrated into the Armenian mountains—and others. Not till the last years of Assur-bani-pal, on which the extant Assyrian annals are silent, can an independent Median Empire have arisen.

The Median Empire.

As to the history of this empire, we have an ancient account in Herodotus, which, with a large admixture of the legendary, still contains numerous historical elements, and a completely fanciful account from Ctesias, preserved in Diodorus (ii. 32 sqq.) and much used by later writers. In the latter Nineveh is destroyed by the Mede Arbaces and the Babylonian Belesys about 880 B.C., a period when the Assyrians were just beginning to lay the foundations of their power. Arbaces is then followed by a long list of Median kings, all of them fabulous. On the other hand, according to Herodotus the Medes revolt from Assyria about 710 B.C., that is to say, at the exact time when they were subdued by Sargon. Deioces founds the monarchy; his son Phraortes begins the work of conquest; and his son Cyaxares is first overwhelmed by the Scythians, then captures Nineveh, and raises Media to a great power. A little supplementary information may be gleaned from the inscriptions of King Nabonidus of Babylon (555–539) and from a few allusions in the Old Testament. Of the Median Empire itself we do not possess a single monument. Consequently its history still lies in complete obscurity (cf. MEDIA; DEIOCES; PHRAORTES; CYAXARES).

The beginnings of the Median monarchy can scarcely go farther back than 640 B.C. To all appearance, the insurrection against Assyria must have proceeded from the desert tribe of the Manda, mentioned by Sargon: for Nabonidus invariably describes the Median kings as "kings of the Manda." According to the account of Herodotus, the dynasty was derived from Deioces, the captive of Sargon, whose descendants may have found refuge in the desert. The first historical king would seem to have been Phraortes, who probably succeeded in subduing the small local princes of Media and in rendering himself independent of Assyria. Further development was arrested by the Scythian invasion described by Herodotus. We know from Zephaniah and Jeremiah that these northern barbarians, in 626 B.C., overran and harried Syria and Palestine (cf. CYAXARES; JEWS). With these inroads of the Cimmerians and Scythians (see SCYTHIA), we must doubtless connect the great ethnographical revolution in the north of anterior Asia; the Indo-European Armenians (*Haik*), displacing the old Alarodians (*Urartu*, *Ararat*), in the country which has since borne their name; and the entry of the Cappadocians—first mentioned in the Persian period—into the east of Asia Minor. The Scythian invasion evidently contributed largely to the enfeeblement of the Assyrian Empire: for in the same year the Chaldaean Nabopolassar founded the New-Babylonian empire; and in 606 B.C. Cyaxares captured and destroyed Nineveh and the other Assyrian cities. Syria and the south he abandoned to Nabopolassar and his son Nebuchadrezzar; while, on the other hand, Assyria proper, east of the Tigris, the north of Mesopotamia with the town of Harran (*Carrhae*) and the mountains of Armenia were annexed by the Medes. Cappadocia also fell before Cyaxares; in a war with the Lydian Empire the decisive battle was broken off by the celebrated eclipse of the sun on the 28th of May 585 B.C., foretold by Thales (Herod. i. 74). After this a peace was arranged by Nebuchadrezzar of Babylon and Syennesis of Cilicia, recognizing the Halys as the borderline. To the east, the Median Empire extended far over Iran, even the Persians owning its sway. Ecbatana (*q.v.*) became the capital.

Of the states which arose out of the shattered Assyrian Empire (Media, Babylon, Egypt, Cilicia and Lydia), Media was by far the strongest. In Babylon the kings feared, and the exiled Jews hoped, an attack from the Medes (cf. Isa. xiii., xiv., xxi.; Jer. l., li.); and Nebuchadrezzar sought by every means—great fortifications, canals and so forth—to secure his empire against the menace from the north. He succeeded in maintaining the *status quo* practically unimpaired, additional security being found in intermarriage between the two dynasties. In this state of equilibrium the great powers of Anterior Asia remained during the first half of the 6th century.

Conquests of Cyrus and Cambyses.

V. *The Persian Empire of the Achaemenids.*—The balance, however, was disturbed in 553 B.C., when the Persian Cyrus, king of Anshan in Elam (*Susiana*), revolted against his suzerain Astyages, the son of Cyaxares, and three years later defeated him at Pasargadae (*q.v.*).[1] Shortly afterwards Astyages was taken prisoner, Ecbatana reduced, and the Median Empire replaced by the Persian. The Persian tribes were welded by Cyrus into a single nation, and now became the foremost people in the world (see PERSIS and CYRUS). At first Nabonidus of Babylon hailed the fall of the Medes with delight and utilized the opportunity by occupying Harran (Carrhae). But before long he recognized the danger threatened from that quarter. Cyrus and his Persians paid little heed to the treaties which the Median king had concluded with the other powers; and the result was a great coalition against him, embracing Nabonidus of Babylon, Amasis of Egypt, Croesus of Lydia, and the Spartans, whose highly efficient army seemed to the Oriental states of great value. In the spring of 546 B.C., Croesus opened the attack. Cyrus

[1] See further, BABYLONIA AND ASSYRIA: § v. *History*.

flung himself upon him, beat him at Pteria in Cappadocia and pursued him to Lydia. A second victory followed on the banks of the Pactolus; by the autumn of 546 Sardis had already fallen and the Persian power advanced at a bound to the Mediterranean. In the course of the next few years the Greek littoral towns were reduced, as also the Carians and Lycians. The king of Cilicia (Syennesis) voluntarily acknowledged the Persian suzerainty. In 539 Nabonidus was defeated and Babylon occupied, while, with the Chaldean Empire, Syria and Palestine also became Persian (see JEWS). The east of Iran was further subdued, and, after Cyrus met his end (528 B.C.) in a war against the eastern Nomads (Dahae, Massagetae), his son Cambyses conquered Egypt (525 B.C.). Cyprus and the Greek islands on the coast of Asia Minor also submitted, Samos being taken by Darius. On the other hand, an expedition by Cambyses against the Ethiopian kingdom of Napata and Meroe came to grief in Nubia. The usurpation of Smerdis (522–521 B.C.) and his death at the hands of Darius was the signal for numerous insurrections in Babylon, Susiana, Persis, Media, Armenia and many of the Eastern provinces. But, within two years (521–519), they were all crushed by Darius and his generals.

Arms and Armour.

The causes of this astonishing success, which, in the brief space of a single generation, raised a previously obscure and secluded tribe to the mastery of the whole Orient, can only be partially discerned from the evidence at our disposal. The decisive factor was of course their military superiority. The chief weapon of the Persians, as of all Iranians, was the bow, which accordingly the king himself holds in his portraits, *e.g.* on the Behistun rock and the coins (*darics*). In addition to the bow, the Persians carried short lances and short daggers. But it was not by these weapons, nor by hand to hand fighting, that the Persian victories were won. They overwhelmed their enemy under a hail of arrows, and never allowed him to come to close quarters. While the infantry kneeled to shoot, the cavalry swarmed round the hostile squadrons, threw their lines into confusion, and completed their discomfiture by a vigorous pursuit. In a charge the infantry also might employ lance and dagger; but the essential point was that the archers should be mobile and their use of the bow unhampered.

Consequently, only a few distinguished warriors wore shirts of mail. For purposes of defence the rank and file merely carried a light hide-covered shield; which the infantry, in shooting, planted before them as a sort of barrier against the enemy's missiles. Thus the Persian army was lost, if heavy-armed hoplites succeeded in gaining their lines. In spite of all their bravery, they succumbed to the Greek phalanx, when once the generalship of a Miltiades or a Pausanias had brought matters to a hand to hand conflict; and it was with justice that the Greeks—Aeschylus, for instance—viewed their battles against the Persian as a contest between spear and bow. None the less, till Marathon the Persians were successful in discomfiting every enemy before he could close, whether that enemy consisted of similarly accoutred bowmen (as the Medes), of cavalry armed with the lance (as the Lydians), or of heavily armoured warriors (as the Babylonians, Egyptians and Greeks).

To all this should be added the superiority of their leaders; Cyrus especially must have been an exceedingly able general. Obviously, also, he must have understood the art of organizing his people and arousing the feeling of nationality and the courage of self-sacrifice. In his time the Persians were a strong manly peasantry, domiciled in a healthy climate and habituated to all hardships—a point repeatedly emphasized, in the tales preserved by Herodotus, as the cause of their successes (*e.g.* Herod. ix. 122). Herodotus, however, also records (i. 135) that the Persians were "of all mankind the readiest to adopt foreign customs, good or bad," a sentence which is equally applicable to the Romans, and which in the case of both nations goes far to explain, not merely their successes, but also the character of their empires.

Organization of Darius.

The fundamental features of the imperial organization must have been due to Cyrus himself. Darius followed in his steps and completed the vast structure. His rôle, indeed, was peculiarly that of supplementing and perfecting the work of his great predecessor. The organization of the empire is planned throughout on broad, free lines; there is nothing mean and timorous in it. The great god Ahuramazda, whom king and people alike acknowledge, has given them dominion "over this earth afar, over many peoples and tongues;" and the consciousness is strong in them that they are masters of the world. Thus their sovereign styles himself "the king of kings" and "the king of the lands"—that is to say, of the whole civilized world. For the provinces remaining unsubdued on the extreme frontiers to the west, the north and the east are in their view almost negligible quantities. And far removed as the Persians are from disavowing their proud sense of nationality ("a Persian, the son of a Persian, an Aryan of Aryan stock" says Darius of himself in the inscription on his tomb)—yet equally vivid is the feeling that they rule the whole civilized world, that their task is to reduce it to unity, and that by the will of Ahuramazda they are pledged to govern it aright.

Subject Nations.

This is most clearly seen in the treatment of the subject races. In contrast with the Assyrians and the Romans the Persians invariably conducted their wars with great humanity. The vanquished kings were honourably dealt with, the enemy's towns were spared, except when grave offences and insurrections, as at Miletus and Athens, rendered punishment imperative; and their inhabitants were treated with mildness. Like Cyrus, all his successors welcomed members of the conquered nationalities to their service, employed them as administrators or generals and made them grants of land: and this not only in the case of Medes, but also of Armenians, Lydians, Jews and Greeks. The whole population of the empire was alike bound to military service. The subject-contingents stood side by side with the native Persian troops; and the garrisons—in Egypt, for instance—were composed of the most varied nationalities.

Among the subject races the Medes particularly stood high in favour. Darius in his inscriptions always names them immediately after the Persians. They were the predecessors of the Persians in the empire and the more civilized people. Their institutions, court ceremonial and dress were all adopted by the Achaemenids. Thus the tribal distinctions began to recede, and the ground was prepared for that amalgamation of the Iranians into a single, uniform nation, which under the Sassanids was completely perfected—at least for west of Iran.

The Persians.

The lion's share, indeed, falls to the dominant race itself. The inhabitants of Persis proper—from which the eastern tribes of Carmanians, Utians, &c., were excluded and formed into a separate satrapy—pay no taxes. Instead, they bring the best of their possessions (*e.g.* a particularly fine fruit) as a gift to their king on festival days; peasants meeting him on his excursions do the same (Plut. *Artax.* 4. 5; Dinon *ap.* Aelian. *var. hist.* i. 31; Xen. *Cyr.* viii. 5, 21. 7, 1). In recompense for this, he distributes on his return rich presents to every Persian man and woman—the women of Pasargadae, who are members of Cyrus's tribe, each receiving a piece of gold (Nic. Dam. fr. 66. Plut. *Alex.* 69). In relation to his Persians, he is always the people's king. At his accession he is consecrated in the temple of a warrior-goddess (Anaitis?) at Pasargadae, and partakes of the simple meal of the old peasant days—a mess of figs, terebinths and sour milk (Plut. *Artax.* 3). The Persians swear allegiance to him and pray to Ahuramazda for his life and the welfare of the people, while he vows to protect them against every attack, and to judge and govern them as did his fathers before him (Herod. i. 132; Xen. *Cyr.* xviii. 5, 25, 27). For helpers he has at his side the "law-bearers" (*databara*, Dan. iii. 2, and in Babyl. documents; cf. Herod. iii. 31, v. 25, vii. 194; Esther i. 13, &c.). These—the Persian judges—are nominated by the king for life, and generally bequeath their office to their sons. The royal decision is based on consultation with the great ones of his people; and such is the case with his officials and governors everywhere (cf. the Book of Ezra).

Every Persian able to bear arms is bound to serve the king—the great landowners on horseback, the commonalty on foot. The noble and well-to-do, who need not till their fields in person, are pledged to appear at court as frequently as possible. Their children are brought up in company with the princes "at the gates of the king," instructed in the handling of arms, in riding and hunting, and introduced to the service of the state and the knowledge of the law, as well as the commandments of religion. Then such as prove their worth are called to high office and rewarded, generally with grants of land.

The highest rank was held by the descendants of the six great families, whose heads stood by Darius at the killing of the Magian. The Greeks class them and the king together, under the name of "the seven Persians." These enjoyed the right of entering the presence unannounced, and possessed princely estates in the provinces. Besides these, however, numbers of other Persians were despatched to the provinces, settled there, and endowed with lands. There existed, in fact, under the Achaemenids a strong colonizing movement, diffused through the whole empire; traces of this policy occur more especially in Armenia, Cappadocia and Lycia, but also in the rest of Asia Minor, and not rarely in Syria and Egypt. These colonists formed the nucleus of the provincial military levy, and were a tower of strength to the Persian dominion. They composed, moreover, the Persian council, and vice-regal household of the Satraps, exactly as the Persians of the home-country composed that of the king.

Though the world-empire of Persia was thus deeply impressed by a national character, care was nevertheless exercised that the general duties and interests of the subject races should receive due consideration. We find their representatives, side by side with the Persians, occupying every sort of position in the regal and vice-regal courts. They take their part in the councils of the satraps, precisely as they do in military service (cf. the evidence of Ezra); and they, too, are rewarded by bounties and estates. To wield a peaceful authority over all the subjects of the empire, to reward merit, and to punish transgression—such is the highest task of king and officials.

Royal Residences. On his native soil Cyrus built himself a town, with a palace and a tomb, in the district of Pasargadae (now the ruins of Murghab). This Darius replaced by a new capital, deeper in the centre of the country, which bore the name "Persian" (*Pārsa*), the Persepolis (*q.v.*) of the later Greeks. But the district of Persis was too remote to be the administrative centre of a world-empire. The natural centre lay, rather, in the ancient fertile tract on the lower Tigris and Euphrates. The actual capital of the empire was therefore Susa, where Darius I. and Artaxerxes II. erected their magnificent palaces. The winter months the kings chiefly spent in Babylon: the hot summer, in the cooler situation of Ecbatana, where Darius and Xerxes built a residence on Mt Elvend, south of the city. From a palace of Artaxerxes II. in Ecbatana itself, the fragments of a few inscribed columns (now in the possession of Mr Lindo Myers and published by Evetts in the *Zeitschr. f. Assyr. V.*) have been preserved. To Persis and Persepolis the kings paid only occasional visits especially at their coronations.

Babylonia and Egypt. Within the empire, the two great civilized states incorporated by Cyrus and Cambyses, Babylon and Egypt, occupied a position of their own. After his defeat of Nabonidus, Cyrus proclaimed himself "King of Babel"; and the same title was born by Cambyses, Smerdis and Darius. So, in Egypt, Cambyses adopted in full the titles of the Pharaohs. In this we may trace a desire to conciliate the native population, with the object of maintaining the fiction that the old state still continued. Darius went still farther. He encouraged the efforts of the Egyptian priesthood in every way, built temples, and enacted new laws in continuance of the old order. In Babylon his procedure was presumably similar, though here we possess no local evidence. But he lived to see that his policy had missed its goal. In 486 B.C. Egypt revolted and was only reduced by Xerxes in 484. It was this, probably, that induced him in 484 to renounce his title of "king of Babel," and to remove from its temple the golden statue of Bel-Marduk (Merodach), whose hands the king was bound to clasp on the first day of each year. This proceeding led to two insurrections in Babylon (probably in 484 and 479 B.C.), which were speedily repressed. After that the "kingship of Babel" was definitely abolished. In Egypt the Persian kings still retained the style of the Pharaohs; but we hear no more of concessions to the priesthood or to the old institutions, and, apart from the great oasis of el-Kharga, no more temples were erected (see EGYPT: *History*).

The Vizier and other Officials. At the head of the court and the imperial administration stands the commandant of the body-guard—the ten thousand "Immortals," often depicted in the sculptures of Persepolis with lances surmounted by golden apples This grandee, whom the Greeks termed "Chiliarch," corresponds to the modern vizier. In addition to him, we find seven councillors (Ezra vii. 14; cf. Esther i. 14). Among the other officials, the "Eye of the King" is frequently mentioned. To him was entrusted the control of the whole empire and the superintendence of all officials.

Official Languages. The orders of the court were issued in a very simple form of the cuneiform script, probably invented by the Medes. This comprised 36 signs, almost all of which denote single sounds. In the royal inscriptions, a translation into Susan (Elamitic) and Babylonian was always appended to the Persian text. In Egypt one in hieroglyphics was added, as in the inscriptions of the Suez canal; in the Grecian provinces, another in Greek (*e.g.* the inscription of Darius on the Bosporus, Herod. iv. 37, cf. iv. 91). The cuneiform script could only be written on stone or clay. Thus there has been discovered in Babylon a copy of the Behistun (*q.v.*) inscription preserved on a block of dolerite (Weissbach, *Babylonische Miscellen*, p. 24). For administrative purposes, however, it would seem that this inconvenient material was not employed; its place being taken by skins (διφθέραι, parchment), the use of which was adopted from the western peoples of the empire. On these were further written the journals and records kept at the court (cf. Diod. ii. 22, 32; Ezra iv. 15, v. 17, vi. 2; Esther vi. 1, ii. 23). With such materials the cuneiform script could not be used; instead, the Persian language was written in Aramaic characters, a method which later led to the so-called Pahlavi, *i.e.* Parthian script. This mode of writing was obviously alone employed in the state-services since Darius I.; and so may be explained the fact that, under the Achaemenids, the Persian language rapidly declined, and, in the inscriptions of Artaxerxes III., only appears in an extremely neglected guise (see CUNEIFORM INSCRIPTIONS, ALPHABET).

Side by side with the Persian, the Aramaic, which had long been widely diffused as the speech of commerce, enjoyed currency in all the western half of the empire as a second dominant language. Thus all deeds, enactments and records designed for these provinces were furnished with an official Aramaic version (Ezra iv. 7). Numerous documents in this tongue, dating from the Persian period, have been discovered in Egypt (cf. Sayce and Cowley, *Aramaic Papyri discovered at Assuan* 1906), and the coins minted by the satraps and generals usually bear an Aramaic inscription. (So, also, a lion-weight from Abydos, in the British Museum.) The Demotic in Egypt was employed in private documents alone. Only in the Hellenic provinces of the empire Greek replaced Aramaic (cf. the letter to Pausanias in Thuc. i. 129; an edict to Gadatas in Magnesia, Cousin et Deschamps, *Bulletin de corresp. hellénique*, xii. 530; Dittenberger, *Sylloge* 2; so, also, on coins)—a clear proof that the Persians had already begun to recognize the independent and important position of Greek civilization.[1]

The Satrapies. Darius I. divided the Persian Empire into twenty great provinces, satrapies, with a "guardian of the country" (*khshathrapavan*; see SATRAP) at the head of each. A list is preserved in Herodotus (iii. 89 sqq.); but the boundaries were frequently changed. Each satrapy was again subdivided into several minor governorships. The satrap is the head of the whole administration of his province. He levies the taxes, controls the legal procedure, is responsible for the security of roads and property, and superintends the subordinate districts. The heads of the great military centres of the empire and the commandants of the royal fortresses are outside his jurisduction: yet the satraps are entitled to a body of troops of their own, a privilege which they used to the full, especially in later periods. The satrap is held in his position as a subject by the controlling machinery of the empire, especially the "Eye of the King"; by the council of Persians in his province with

[1] For the editions of the Persian inscriptions see BEHISTUN. For the Persian documents, Ed. Meyer, *Entstehung des Judentums*, p. 19 sqq. The hieroglyphic inscriptions of the Suez Canal are published in the *Recueil de trav. d'égyptol. et d'assyriol.* vols. vii. ix. xi. xiii; the private documents from Babylonia and Nippur, by Strassmaier, *Babyl. Urkunden*, and Hilprecht and Clay, *Babyl. Exped. of Univ. of Pennsylvania*, vols. ix. x. Numerous Jewish documents in Aramaic have been found at Elephantine (Sayce and Cowley, *Aramaic Papyri discovered at Assuan*, 1906), among them an official complaint of the Jewish colony settled at Elephantine, addressed to the Persian satrap of Judaea, in 408 B.C., which throws a new light on many passages in Ezra and Nehemiah, published by Sachau in *Abhandlungen der berl. Akademie*, 1907.

flung himself upon him, beat him at Pteria in Cappadocia and pursued him to Lydia. A second victory followed on the banks of the Pactolus; by the autumn of 546 Sardis had already fallen and the Persian power advanced at a bound to the Mediterranean. In the course of the next few years the Greek littoral towns were reduced, as also the Carians and Lycians. The king of Cilicia (Syennesis) voluntarily acknowledged the Persian suzerainty. In 539 Nabonidus was defeated and Babylon occupied, while, with the Chaldean Empire, Syria and Palestine also became Persian (see JEWS). The east of Iran was further subdued, and, after Cyrus met his end (528 B.C.) in a war against the eastern Nomads (Dahae, Massagetae), his son Cambyses conquered Egypt (525 B.C.). Cyprus and the Greek islands on the coast of Asia Minor also submitted, Samos being taken by Darius. On the other hand, an expedition by Cambyses against the Ethiopian kingdom of Napata and Meroe came to grief in Nubia. The usurpation of Smerdis (522–521 B.C.) and his death at the hands of Darius was the signal for numerous insurrections in Babylon, Susiana, Persis, Media, Armenia and many of the Eastern provinces. But, within two years (521–519), they were all crushed by Darius and his generals.

Arms and Armour.

The causes of this astonishing success, which, in the brief space of a single generation, raised a previously obscure and secluded tribe to the mastery of the whole Orient, can only be partially discerned from the evidence at our disposal. The decisive factor was of course their military superiority. The chief weapon of the Persians, as of all Iranians, was the bow, which accordingly the king himself holds in his portraits, *e.g.* on the Behistun rock and the coins (*darics*). In addition to the bow, the Persians carried short lances and short daggers. But it was not by these weapons, nor by hand to hand fighting, that the Persian victories were won. They overwhelmed their enemy under a hail of arrows, and never allowed him to come to close quarters. While the infantry kneeled to shoot, the cavalry swarmed round the hostile squadrons, threw their lines into confusion, and completed their discomfiture by a vigorous pursuit. In a charge the infantry also might employ lance and dagger; but the essential point was that the archers should be mobile and their use of the bow unhampered.

Consequently, only a few distinguished warriors wore shirts of mail. For purposes of defence the rank and file merely carried a light hide-covered shield; which the infantry, in shooting, planted before them as a sort of barrier against the enemy's missiles. Thus the Persian army was lost, if heavy-armed hoplites succeeded in gaining their lines. In spite of all their bravery, they succumbed to the Greek phalanx, when once the generalship of a Miltiades or a Pausanias had brought matters to a hand to hand conflict; and it was with justice that the Greeks—Aeschylus, for instance—viewed their battles against the Persian as a contest between spear and bow. None the less, till Marathon the Persians were successful in discomfiting every enemy before he could close, whether that enemy consisted of similarly accoutred bowmen (as the Medes), of cavalry armed with the lance (as the Lydians), or of heavily armoured warriors (as the Babylonians, Egyptians and Greeks).

To all this should be added the superiority of their leaders; Cyrus especially must have been an exceedingly able general. Obviously, also, he must have understood the art of organizing his people and arousing the feeling of nationality and the courage of self-sacrifice. In his time the Persians were a strong manly peasantry, domiciled in a healthy climate and habituated to all hardships—a point repeatedly emphasized, in the tales preserved by Herodotus, as the cause of their successes (*e.g.* Herod. ix. 122). Herodotus, however, also records (i. 135) that the Persians were "of all mankind the readiest to adopt foreign customs, good or bad," a sentence which is equally applicable to the Romans, and which in the case of both nations goes far to explain, not merely their successes, but also the character of their empires.

Organization of Darius.

The fundamental features of the imperial organization must have been due to Cyrus himself. Darius followed in his steps and completed the vast structure. His rôle, indeed, was peculiarly that of supplementing and perfecting the work of his great predecessor. The organization of the empire is planned throughout on broad, free lines; there is nothing mean and timorous in it. The great god Ahuramazda, whom king and people alike acknowledge, has given them dominion "over this earth afar, over many peoples and tongues;" and the consciousness is strong in them that they are masters of the world. Thus their sovereign styles himself "the king of kings" and "the king of the lands"—that is to say, of the whole civilized world. For the provinces remaining unsubdued on the extreme frontiers to the west, the north and the east are in their view almost negligible quantities. And far removed as the Persians are from disavowing their proud sense of nationality ("a Persian, the son of a Persian, an Aryan of Aryan stock" says Darius of himself in the inscription on his tomb)—yet equally vivid is the feeling that they rule the whole civilized world, that their task is to reduce it to unity, and that by the will of Ahuramazda they are pledged to govern it aright.

Subject Nations.

This is most clearly seen in the treatment of the subject races. In contrast with the Assyrians and the Romans the Persians invariably conducted their wars with great humanity. The vanquished kings were honourably dealt with, the enemy's towns were spared, except when grave offences and insurrections, as at Miletus and Athens, rendered punishment imperative; and their inhabitants were treated with mildness. Like Cyrus, all his successors welcomed members of the conquered nationalities to their service, employed them as administrators or generals and made them grants of land: and this not only in the case of Medes, but also of Armenians, Lydians, Jews and Greeks. The whole population of the empire was alike bound to military service. The subject-contingents stood side by side with the native Persian troops; and the garrisons—in Egypt, for instance—were composed of the most varied nationalities.

Among the subject races the Medes particularly stood high in favour. Darius in his inscriptions always names them immediately after the Persians. They were the predecessors of the Persians in the empire and the more civilized people. Their institutions, court ceremonial and dress were all adopted by the Achaemenids. Thus the tribal distinctions began to recede, and the ground was prepared for that amalgamation of the Iranians into a single, uniform nation, which under the Sassanids was completely perfected—at least for west of Iran.

The Persians.

The lion's share, indeed, falls to the dominant race itself. The inhabitants of Persis proper—from which the eastern tribes of Carmanians, Utians, &c., were excluded and formed into a separate satrapy—pay no taxes. Instead, they bring the best of their possessions (*e.g.* a particularly fine fruit) as a gift to their king on festival days; peasants meeting him on his excursions do the same (Plut. *Artax.* 4. 5; Dinon *ap.* Aelian. *var. hist.* i. 31; Xen. *Cyr.* viii. 5, 21. 7, 1). In recompense for this, he distributes on his return rich presents to every Persian man and woman—the women of Pasargadae, who are members of Cyrus's tribe, each receiving a piece of gold (Nic. Dam. fr. 66. Plut. *Alex.* 69). In relation to his Persians, he is always the people's king. At his accession he is consecrated in the temple of a warrior-goddess (Anaitis?) at Pasargadae, and partakes of the simple meal of the old peasant days—a mess of figs, terebinths and sour milk (Plut. *Artax.* 3). The Persians swear allegiance to him and pray to Ahuramazda for his life and the welfare of the people, while he vows to protect them against every attack, and to judge and govern them as did his fathers before him (Herod. i. 132; Xen. *Cyr.* xviii. 5, 25, 27). For helpers he has at his side the "law-bearers" (*databara*, Dan. iii. 2, and in Babyl. documents; cf. Herod. iii. 31, v. 25, vii. 194; Esther i. 13, &c.). These—the Persian judges—are nominated by the king for life, and generally bequeath their office to their sons. The royal decision is based on consultation with the great ones of his people; and such is the case with his officials and governors everywhere (cf. the Book of Ezra).

Every Persian able to bear arms is bound to serve the king—the great landowners on horseback, the commonalty on foot. The noble and well-to-do, who need not till their fields in person, are pledged to appear at court as frequently as possible. Their children are brought up in company with the princes "at the gates of the king," instructed in the handling of arms, in riding and hunting, and introduced to the service of the state and the knowledge of the law, as well as the commandments of religion. Then such as prove their worth are called to high office and rewarded, generally with grants of land.

in his foundation of several harbours, described by Nearchus, on the Persian coast. But this design is still more patent in his completion of a great canal, already begun by Necho, from the Nile to Suez, along which several monuments of Darius have been preserved. Thus it was possible, as says the remnant of an hieroglyphic inscription there discovered, "for ships to sail direct from the Nile to Persia, over Saba." In the time of Herodotus the canal was in constant use (ii. 158, iv. 39): afterwards, when Egypt regained her independence, it decayed, till restored by the second Ptolemy. Even the circumnavigation of Africa was attempted under Xerxes (Herod. iv. 43).

It has already been mentioned, that, in his efforts to conciliate the Egyptians, Darius placed his chief reliance on the priesthood: and the same tendency runs throughout the imperial policy toward the conquered races. Thus Cyrus himself gave the exiled Jews in Babylon permission to return and rebuild Jerusalem. Darius allowed the restoration of the Temple; and Artaxerxes I., by the protection accorded to Ezra and Nehemiah, made the foundation of Judaism possible (see JEWS: §§ 19 sqq.). Analogously in an edict, of which a later copy is preserved in an inscription (see above), Darius commands Gadatas, the governor of a domain (παράδεισοι) in Magnesia on the Maeander, to observe scrupulously the privileges of the Apollo-sanctuary. With all the Greek oracles—even those in the mother-country—the Persians were on the best of terms. And since these might reasonably expect an enormous extension of their influence from the establishment of a Persian dominion, we find them all zealously medizing during the expedition of Xerxes.

Religion. For the development of the Asiatic religions, the Persian Empire was of prime importance. The definite erection of a single, vast, world-empire cost them their original connexion with the state, and compelled them in future to address themselves, not to the community at large, but to individuals, to promise, not political success nor the independence of the people, but the welfare of the man. Thus they became at once universal and capable of extension by propaganda; and, with this, of entering into keen competition one with the other. These traits are most clearly marked in Judaism; but, after the Achaemenid period, they are common to all Oriental creeds, though our information as to most is scanty in the extreme.

In this competition of religions that of Iran played a most spirited part. The Persian kings—none more so than Darius, whose religious convictions are enshrined in his inscriptions—and, with the kings, their people, were ardent professors of the pure doctrine of Zoroaster; and the Persians settled in the provinces diffused his creed throughout the whole empire. Thus a strong Persian propagandism arose especially in Armenia and Cappadocia, where the religion took deep root among the people, but also in Lydia and Lycia. In the process, however, important modifications were introduced. In contrast with Judaism, Zoroastrianism did not enter the lists against all gods save its own, but found no difficulty in recognizing them as subordinate powers—helpers and servants of Ahuramazda. Consequently, the foreign creeds often reacted upon the Persian. In Cappadocia, Aramaic inscriptions have been discovered (1900), in which the indigenous god, there termed Bel the king, recognizes the "Mazdayasnian Religion" (*Din Mazdayasnish*)—*i.e.* the religion of Ahuramazda personified as a woman—as his sister and wife (Lidzbarski, *Ephem. f. semit. Epigr.* i. 59 sqq.).

The gorgeous cult of the gods of civilization (especially of Babylon), with their host of temples, images and festivals, exercised a corresponding influence on the mother-country. Moreover, the unadulterated doctrine of Zoroaster could no more become a permanent popular religion than can Christianity. For the masses can make little of abstractions and an omnipotent, omnipresent deity; they need concrete divine powers, standing nearer to themselves and their lot. Thus the old figures of the Aryan folk-religion return to the foreground, there to be amalgamated with the Babylonian divinities. The goddess of springs and streams (of the Oxus in particular) and of all fertility—*Ardvisura Anahita, Anaitis*—is endowed with the form of the Babylonian Ishtar and Belit. She is now depicted as a beautiful and strong woman, with prominent breasts, a golden crown of stars and golden raiment. She is worshipped as the goddess of generation and all sexual life (cf. Herod. i. 131, where the names of Mithras and Anaitis are interchanged); and religious prostitution is transferred to her service (Strabo xi. 532, xii. 559). At her side stands the sun-god Mithras, who is represented as a young and victorious hero. Both deities occupy the very first rank in the popular creed; while to the theologian they are the most potent of the good powers—Mithras being the herald and propagator of the service of Light and the mediator betwixt man and Ahuramazda, who now fades more into the background. Thus, in the subsequent period, the Persian religion appears purely as the religion of Mithras. The festival of Mithras is the chief festival of the empire, at which the king drinks and is drunken, and dances the national dance (Ctes. *fr.* 55; Duris *fr.* 13). This development culminated under Artaxerxes II., who, according to Berossus (*fr.* 16 *ap.* Clem. Alex. *prot.* i. 5, 65), first erected statues to Anaitis in Persepolis, Ecbatana, Bactria, Susa, Babylon, Damascus and Sardis. The truth of this account is proved by the fact that Artaxerxes II. and Artaxerxes III. are the only Achaemenids who, in their inscriptions, invoke Anaitis and Mithra side by side with Ahuramazda. Other gods, who come into prominence, are the dragon-slayer Verethraghna (Artagnes) and the Good Thought (Vohumano, Omanos); and even the Saeaean festival is adopted from Babylon (Berossus *fr.* 3; Ctes. *fr.* 16; Strabo xi. 512, &c.). The chief centres of the Persian cults in the west were the district of Acilisene in Armenia (Strabo xi. 532, &c.), the town of Zela in Cappadocia (Strabo xii. 559), and several cities in Lydia.

Art. The position of the Persian monarchy as a world-empire is characteristically emphasized in the buildings of Darius and Xerxes in Persepolis and Susa. The peculiarly national basis, still recognizable in Cyrus's architecture at Pasargadae, recedes into insignificance. The royal edifices and sculptures are dependent, mainly, on Babylonian models, but, at the same time, we can trace in them the influence of Greece, Egypt and Asia Minor; the last in the rock-sepulchres. All these elements are combined into an organic unity, which achieved the greatest creations that Oriental architecture has found possible. Nevertheless, the result is not a national art, but the art of a world-empire; and it is obvious that foreign craftsmen must have been active in the royal services—among them, the Greek sculptor Telephanes of Phocaea (Pliny xxxiv. 68). So, with the collapse of the empire, the imperial art vanishes also: and when, some 500 years later, a new art arose under the Sassanids, whose achievements stand to those of Achaemenid art in much the same relation as the achievements of the two dynasties to each other, we discover only isolated reminiscences of its predecessor.

For the organization and character of the Persian Empire, see Barnabas Brisson, *De regio Persarum principatu libri iii.* (1590); Heeren, *Ideen über Politik, Handel und Verkehr der alten Welt*, i.; G. Rawlinson, *History of Herodotus*, ii. 555 sqq.; *Five Eastern Monarchies*, iii.; Eduard Meyer, *Geschichte des Altertums*, iii. On the Satrapies, cf. Krumbholz, *De Asiae minoris satrapiis persicis* (1883). See also MITHRAS.

3. *History of the Achaemenian Empire.*—The history of the Persian Empire was often written by the Greeks. The most ancient work preserved is that of Herodotus (*q.v.*), who supplies rich and valuable materials for the period ending in 479 B.C. These materials are drawn partly from sound tradition, partly from original knowledge—as in the account of the satrapies and their distribution, the royal highway, the nations in Xerxes' army and their equipment. They also contain much that is admittedly fabulous: for instance, the stories of Cyrus and Croesus, the conquest of Babylon, &c. Forty years later (*c.* 390 B.C.), the physician Ctesias of Cnidus, who for 17 years (414–398 B.C.) remained in the service of the Great King, composed a great work on the Persian history, known to us from an extract in Photius and numerous fragments. Ctesias (*q.v.*) possesses a more precise acquaintance with Persian views and institutions than Herodotus; and, where he deals with matters that came under his own cognisance, he gives much useful information. For the early period, on the other hand, he only proves how rapidly the tradition had degenerated since Herodotus; and here his narrations can only be utilized in isolated cases, and that with the greatest caution. Of more value was the great work of Dinon of Colophon (*c.* 340), which we know from numerous excellent fragments; and on the same level may be placed a few statements from Heraclides of Cyme, which afford specially important evidence on Persian institutions. To these must be added the testimony of the other Greek historians (Thucydides, Ephorus, Theopompus, &c., with the histories of Alexander), and, before all, that of Xenophon in the *Anabasis* and *Hellenica*. The *Cyropaedia* is a didactic romance, written with a view to Greek institutions and rarely preserving genuine information on the Persian Empire. Of Oriental sources, only the contemporary books of Ezra and Nehemiah are of much importance: also, a few statements in the much later Esther romance. Berossus's history of Babylon contained much valuable and trustworthy information, but next to nothing has survived. That the native tradition almost entirely forgot the Achaemenid Empire, has been mentioned above. For a more detailed account

of these sources see separate articles on HERODOTUS, &c.; EZRA; and NEHEMIAH.

Of modern accounts see especially Th. Nöldeke, *Aufsätze zur persischen Geschichte* (1887). The works of Marquart, *Untersuchungen zur Geschichte von Eran* (2 pts., 1896–1905), abound in daring theories and must be used with caution. On the chronology, cf. Eduard Meyer, *Forschungen zur alten Geschichte*, ii.

List of the Kings.

The external history of the empire is treated under the individual kings (see also history sections of articles GREECE; EGYPT; &c.). The order is as follows:—

CYRUS (558–528); conquered the Medes in 550; king of Babylon from 538.
CAMBYSES (528–521).
SMERDIS (521).
DARIUS I. (521–485).
XERXES I. (485–465).
ARTAXERXES I. (465–425).
(XERXES II. and Secydianus or Sogdianus, 425–424.)
DARIUS II. Nothus (424–404).
ARTAXERXES II. (404–359).
ARTAXERXES III. Ochus (359–338).
ARSES (338–336).
DARIUS III. (336–330).

The chronology is exactly verified by the Ptolemaic canon, by numerous Babylonian and a few Egyptian documents, and by the evidence of the Greeks. The present article gives only a brief conspectus of the main events in the history of the empire.

The Wars against Greece.

Though, unlike Cyrus and Cambyses, Darius made no new expeditions of conquest, yet a great empire, which is not bounded by another equally great, but touches on many small tribes and independent communities, is inevitably driven to expansion. We have already seen that the attempt of Darius to control the predatory nomads in the north led to his expedition against the Scythians; this, again, led to the incorporation of Thrace and Macedonia, whose king Perdiccas submitted. And since a great portion of the Mediterranean coast-line belonged to the empire, further complications resulted automatically. In contrast with the Greeks Carthage took the part of Persia. Darius, indeed, numbers the city—under the name of Karka—among his dominions: as also the Maxyans (Maciya) on the Syrtes (Andreas, *Verhandl. d. xiii. oriental. Congresses*, Hamburg, 1902, p. 97). But, above all, the Greek cities with their endless feuds and violent internal factions, were incessant in their appeals for intervention. Nevertheless, Darius left European Greece to itself, till the support accorded to the Ionian and Carian insurgents by Athens and Eretria (499 B.C.) made war inevitable. But not only the expeditions of Mardonius (492) and Datis (490), but even the carefully prepared campaign of Xerxes, in conjunction with Carthage, completely failed (480–479). On the fields of Marathon and Plataea, the Persian archers succumbed to the Greek phalanx of hoplites; but the actual decision was effected by Themistocles, who had meanwhile created the Athenian fleet which at Salamis proved its superiority over the Perso-Phoenician armada, and thus precluded beforehand the success of the land-forces.

The wreck of Xerxes' expedition is the turning-point in the history of the Persian Empire. The superiority of the Greeks was so pronounced that the Persians never found courage to repeat their attack. On the contrary, in 466 B.C. their army and fleet were again defeated by Cimon on the Eurymedon, the sequel being that the Greek provinces on the Asiatic coast, with all the Thracian possessions, were lost. In itself, indeed, this loss was of no great significance to such a vast empire; and the attempts of Athens to annex Cyprus and conquer the Nile valley, in alliance with the revolted Egyptians, ended in failure. Athens, in fact, had not sufficient strength to undertake a serious invasion of the empire or an extensive scheme of conquest. Her struggles with the other Hellenic states constrained her, by the peace of Callias (448), definitely to renounce the Persian war; to abandon Cyprus and Egypt to the king; and to content herself with his promise—not that he would surrender the littoral towns, but that he would abstain from an armed attack upon them. The really decisive point was, rather, that the disasters of Salamis and Plataea definitely shattered the offensive power of the empire; that the centre of gravity in the world's histor had shifted from Susa and Babylon to the Aegean Sea; an that the Persians were conscious that in spite of all their courag they were henceforward in the presence of an enemy, superio in arms as well as in intellect, whom they could not hope t subdue by their own strength.

Internal State of th Empire. Rebellions

Thus the great empire was reduced to immobility and stagna tion—a process which was assisted by the deteriorating influence of civilization and world-dominion upon the character of the ruling race. True, the Persians continued to produce brave and honourable men. But the influences of the harem, the eunuchs, and similar court officials, made appalling progress, and men of energy bega to find the temptations of power stronger than their patriotisn and devotion to the king. Thus the satraps aspired to inde pendence, not merely owing to unjust treatment, but also t avarice or favourable conditions. As early as 465 B.C., Xerxe was assassinated by his powerful vizier (chiliarch) Artabanus who attempted to seize the reins of empire in fact, if not in name A similar instance may be found in Bagoas (*q.v.*), after th murder of Artaxerxes III. (338 B.C.). To these factors mus be added the degeneration of the royal line—a degeneratio inevitable in Oriental states. Kings like Xerxes and mor especially Artaxerxes I. and Artaxerxes II., so far from bein gloomy despots, were good-natured potentates, but weak capricious and readily accessible to personal influences. Th only really brutal tyrants were Darius II., who was complete dominated by his bloodthirsty wife Parysatis, and Artaxerxe III. who, though he shed rivers of blood and all but exterminate his whole family, was successful in once more uniting the empire which under the feeble sway of his father had been threatene with dissolution.

The upshot of these conditions was, that the empire neve again undertook an important enterprise, but neglected mor and more its great civilizing mission. In considering, however the subsequent disorders and wars, it must be borne in min that they affected only individual portions of the empire, an only on isolated occasions involved more extensive areas i long and serious strife. To most of the provinces the Achae menid dominion was synonymous with two centuries of peac and order. Naturally, however, the wild tribes of the mountain and deserts, who could be curbed only by strict imperial control, asserted their independence and harassed the neighbouring provinces. Among these tribes were the Carduchians in Zagros, the Cossaeans and Uxians in the interior of Elam, the Cadusian and other non-Aryan tribes in northern Media, the Pisidians, Isaurians and Lycaonians in the Taurus, and the Mysians in Olympus. All efforts to restore order in these districts were fruitless; and when the kings removed their court to Ecbatana, they were actually obliged to purchase a free passage from the mountain tribes (Strabo xi. 524; Arrian iii. 17, 1). The kings (*e.g.* Artaxerxes II.) repeatedly took the field in great force against the Cadusians, but unsuccessfully. When, in 400 B.C., Xenophon marched with the mercenaries of Cyrus from the Tigris to the Black Sea, the authority of the king was non-existent north of Armenia, and the tribes of the Pontic mountains, with the Greek cities on the coast, were completely independent. In Paphlagonia, the native dynasts founded a powerful though short-lived kingdom, and the chieftains of the Bithynians were absolutely their own masters. The frontier provinces of India were also lost. Egypt, which had already revolted under Libyan princes in the years 486–484, and again with Athenian help in 460–454, finally asserted its independence in 404. Henceforward the native dynasties repelled every attack, till they succumbed once more before Artaxerxes III. and Mentor of Rhodes.

In the other civilized countries, indeed, the old passion for freedom had been completely obliterated; and after the days of Darius I.—apart from the Greek, Lycian and Phoenician towns—not a single people in all these provinces dreamed of shaking off the foreign dominion. All the more clearly, then, was the inner weakness of the empire revealed by the revolts

of the satraps. These were facilitated by the custom—quite contrary to the original imperial organization—which entrusted the provincial military commands to the satraps, who began to receive great masses of Greek mercenaries into their service. Under Artaxerxes I. and Darius II. these insurrections were still rare. But when the revolt of the younger Cyrus against his brother (401 B.C.) had demonstrated the surprising ease and rapidity with which a courageous army could penetrate into the heart of the empire—when the whole force of that empire had proved powerless, not only to prevent some 12,000 Greek troops, completely surrounded, cut off from their communications, and deprived through treachery of their leaders, from escaping to the coast, but even to make a serious attack on them—then, indeed, the imperial impotence became manifest. After that, revolts of the satraps in Asia Minor and Syria were of everyday occurrence, and the task of suppressing them was complicated by the foreign wars which the empire had to sustain against Greece and Egypt.

Later Wars with the Greeks. Peace of Antalcidas.

At this very period, however, the foreign policy of the empire gained a brilliant success. The collapse of the Athenian power before Syracuse (413 B.C.) induced Darius II. to order his satraps Tissaphernes and Pharnabazus, in Asia Minor, to collect the tribute overdue from the Greek cities. In alliance with Sparta (see PELOPONNESIAN WAR), Persia intervened in the conflict against Athens, and it was Persian gold that made it possible for Lysander to complete her overthrow (404 B.C.). True, war with Sparta followed immediately, over the division of the spoils, and the campaigns of the Spartan generals in Asia Minor (399–395) were all the more dangerous as they gave occasion to numerous rebellions. But Persia joined the Greek league against Sparta, and in 394 Pharnabazus and Conon annihilated the Lacedaemonian fleet at Cnidus. Thus the Spartan power of offence was crippled; and the upshot of the long-protracted war was that Sparta ruefully returned to the Persian alliance, and by the Peace of Antalcidas (*q.v.*), concluded with the king in 387 B.C., not only renounced all claims to the Asiatic possessions, but officially proclaimed the Persian suzerainty over Greece. Ninety years after Salamis and Plataea, the goal for which Xerxes had striven was actually attained, and the king's will was law in Greece. In the following decades, no Hellenic state ventured to violate the king's peace, and all the feuds that followed centred round the efforts of the combatants—Sparta, Thebes, Athens and Argos—to draw the royal powers to their side (see GREECE: *Ancient History*).

But, for these successes, the empire had to thank the internecine strife of its Greek opponents, rather than its own strength. Its feebleness, when thrown on its own resources, is evident from the fact that, during the next years, it failed both to reconquer Egypt and to suppress completely King Evagoras of Salamis in Cyprus. The satrap revolts, moreover, assumed more and more formidable proportions, and the Greek states began once more to tamper with them. Thus the reign of Artaxerxes II. ended, in 359 B.C., with a complete dissolution of the imperial authority in the west. His successor, Artaxerxes Ochus, succeeded yet again in restoring the empire in its full extent. In 355 B.C., he spoke the fatal word, which, a second—or rather a third—time, demolished the essentially unsound power of Athens. In 343 he reduced Egypt, and his generals Mentor and Memnon, with his vizier Bagoas (*q.v.*), crushed once and for all the resistance in Asia Minor. At his death in 338, immediately before the final catastrophe, the empire to all appearances was more powerful and more firmly established than it had been since the days of Xerxes.

Progress of Greek Influence.

These successes, however, were wôn only by means of Greek armies and Greek generals. And simultaneously the Greek civilization—diffused by mercenaries, traders, artists, prostitutes and slaves—advanced in ever greater force. In Asia Minor and Phoenicia we can clearly trace the progress of Hellenism (*q.v.*), especially by the coinage. The stamp is cut by Greek hands and the Greek tongue predominates more and more in the inscription. We can see that the victory of Greek civilization had long been prepared on every side. But the vital point is that the absolute superiority of the Hellene was recognized as incontestable on both hands. The Persian sought to protect himself against danger, by employing Greeks in the national service and turning Greek policy to the interests of the empire. In the Greek world itself the disgrace that a people, called to universal dominion and capable of wielding it, should be dependent on the mandate of an impotent Asiatic monarchy, was keenly felt by all who were not yet absorbed in the rivalry of city with city. The spokesman of this national sentiment was Isocrates; but numerous other writers gave expression to it, notably, the historian Callisthenes of Olynthus. Union between Greeks, voluntary or compulsory, and an offensive war against Persia, was the programme they propounded.

Rise of Macedon.

Nor was the time for its fulfilment far distant. The new power which now rose to the first rank, created by Philip of Macedon, had no engrained tendency inimical to the Persian Empire. Its immediate programme was rather Macedonian expansion, at the expense of Thrace and Illyria, and the subjection of the Balkan Peninsula. But, in its efforts to extend its power over the Greek states, it was bound to make use of the tendencies which aimed at the unification of Greece for the struggle against Persia: and this ideal demand it dared not reject.

Thus the conflict became inevitable. In 340, Artaxerxes III. and his satraps supported the Greek towns in Thrace—Perinthus and Byzantium—against Macedonian aggression; in 338 he concluded an alliance with Demosthenes. When Philip, after the victory of Chaeronea, had founded the league of Corinth (337), embracing the whole of Greece, he accepted the national programme, and in 336 despatched his army to Asia Minor. That he never entertained the thought of conquering the whole Persian Empire is certain. Presumably, his ambitions would have been satisfied with the liberation of the Greek cities, and, perhaps, the subjection of Asia Minor as far as the Taurus. With this his dominion would have attained much the same compass as later under Lysimachus; farther than this the boldest hopes of Isocrates never went.

But Philip's assassination in 336 fundamentally altered the situation. In the person of his son, the throne was occupied by a soldier and statesman of genius, saturated with Greek culture and Greek thought, and intolerant of every goal but the highest. To conquer the whole world for Hellenic civilization by the aid of Macedonian spears, and to reduce the whole earth to unity, was the task that this heir of Heracles and Achilles saw before him. This idea of universal conquest was with him a conception much stronger developed than that which had inspired the Achaemenid rulers, and he entered on the project with full consciousness in the strictest sense of the phrase. In fact, if we are to understand Alexander aright, it is fatal to forget that he was overtaken by death, not at the end of his career, but at the beginning, at the age of thirty-three.

Alexander the Great.

VI. *The Macedonian Dominion.*—How Alexander conquered Persia, and how he framed his world-empire,[1] cannot be related here. The essential fact, however, is that after the victory of Gaugamela (Oct. 1, 331 B.C.) and, still more completely, after the assassination of Darius—avenged according to the Persian laws, on the perpetrators—Alexander regarded himself as the legitimate head of the Persian Empire, and therefore adopted the dress and ceremonial of the Persian kings.

With the capture of the capitals, the Persian war was at an end, and the atonement for the expedition of Xerxes was complete—a truth symbolically expressed in the burning of the palace at Persepolis. Now began the world-conquest. For a universal empire, however, the forces of Macedonia and Greece were insufficient; the monarch of a world-empire could not be bound by the limitations imposed on the tribal king of Macedon or the general of a league of Hellenic republics. He must stand as

[1] See ALEXANDER THE GREAT; MACEDONIAN EMPIRE; HELLENISM (for later results).

an autocrat, above them and above the law, realizing the theoretical doctrines of Plato and Aristotle, as the true king, who is a god among men, bound no more than Zeus by a law, because "himself he is the law." Thus the divine kingship of Alexander derives in direct line, not from the Oriental polities—which (Egypt apart) know nothing of royal apotheosis—but from these Hellenic theories of the state. Henceforward it becomes the form of every absolute monarchy in a civilized land, being formally mitigated only in Christian states by the assumption that the king is not God, but king "by the grace of God." The expedition of 332 B.C. to the shrine of Ammon was a preliminary to this procedure, which, in 324, was sealed by his official elevation to divine rank in all the republics of Greece. To this corresponds the fact that, instead of acting on the doctrines of Aristotle and Callisthenes, and treating the Macedonians and Greeks as masters, the Asiatics as servants, Alexander had impartial recourse to the powers of all his subjects and strove to amalgamate them. In the Persians particularly he sought a second pillar for his world-empire. Therefore, as early as 330 B.C., he drafted 30,000 young Persians, educated them in Greek customs, and trained them to war on the Macedonian model. The Indian campaign showed that his Macedonian troops were in fact inadequate to the conquest of the world, and in the summer of 326 they compelled him to turn back from the banks of the Hyphasis. On his return to Persia, he consummated at Susa (Feb. 324 B.C.) the union of Persian and Macedonian by the great marriage-feast, at which all his superior officers, with some 10,000 more Macedonians, were wedded to Persian wives. The Macedonian veterans were then disbanded, and the Persians taken into his army. Simultaneously, at the Olympian festival of 324, the command was issued to all the cities of Greece to recognize him as god and to receive the exiles home.[1] In 323 B.C. the preparations for the circumnavigation and subjection of Arabia were complete: the next enterprise being the conquest of the West, and the battle for Hellenic culture against Carthage and the Italian tribes. At that point Alexander died in Babylon on the 13th of June 323 B.C.

The Kingdoms of the Diadochi.

Alexander left no heir. Consequently, his death not only ended the scheme of universal conquest, but led to an immediate Macedonian reaction. The army, which was considered as the representative of the people, took over the government under the direction of its generals. The Persian wives were practically all discarded and the Persian satraps removed—at least from all important provinces. But the attempt to maintain the empire in its unity proved impracticable; and almost immediately there began the embittered war, waged for several decades by the generals (diadochi), for the inheritance of the great king.[2] It was soon obvious that the eastern rulers, at all events, could not dispense with the native element. Peucestas, the governor of Persis, there played the rôle of Alexander and won the Persians completely to his side; for which he was dismissed by Antigonus in 315 (Diod. xix. 48). A similar position was attained by Seleucus—the only one of the diadochi, who had not divorced his Persian wife, Apama—in Babylonia, which he governed from 319 to 316 and regained in the autumn of 312. While Antigonus, who, since 315, had striven to win the kingdom of Alexander for himself—was detained by the war with his rivals in the west, Seleucus, with Babylon as his headquarters, conquered the whole of Iran as far as the Indus. In northern Media alone, which lay outside the main scene of operations and had only been partially subject to the later Achaemenids, the Persian satrap Atropates, appointed by Alexander, maintained his independence and bequeathed his province to his successors. His name is borne by north Media to the present day—Atropatene, modern Azerbaijan or Adherbeijan (see MEDIA). So, too, in Armenia the Persian dynasty of the Hydarnids held its ground; and to these must be added, in the east of Asia Minor, the kingdoms of Pontus and Cappadocia, founded *c.* 301, by the Persians Mithradates I. and Ariarathes I. These states were fragments of the Achaemenid Empire, which had safely transferred themselves to the Hellenistic state-system.

Seleucus I. Nicator, and Antiochus I.

The annexation of Iran by Seleucus Nicator led to a war for the countries on the Indian frontier; his opponent being Sandracottus or Chandragupta Maurya (*q.v.*), the founder of the great Indian Empire of Maurya (Palimbothra). The result was that Seleucus abandoned to the Indian king, not merely the Indian provinces, but even the frontier districts west of the Indus (Strabo xv. 689–724), receiving as compensation 500 elephants, with other presents (Appian, *Syr.* 55; Justin xv. 4; Plut. *Alex.* 62; Athen. i. 18 D.). His next expedition was to the west to assist Lysimachus, Ptolemy and Cassander in the overthrow of Antigonus.

The battle of Ipsus, in 301, gave him Syria and the east of Asia Minor; and from then he resided at the Syrian town of Antiochia on the Orontes. Shortly afterwards he handed over the provinces east of the Euphrates to his son Antiochus, who, in the following years, till 282, exercised in the East a very energetic and beneficial activity, which continued the work of his father and gave the new empire and the Oriental Hellenistic civilization their form. In order to protect his conquests Alexander had founded several cities in Bactria, Sogdiana and India, in which he settled his veterans. On his death, these revolted and endeavoured to return to Greece, but were attacked and cut to pieces by Pithon (Diod. xviii. 7).

Greek Towns in Iran.

Of the other Greek towns in Asia scarcely any were founded by Alexander himself, though the plan adopted by his successors of securing their dominions by building Greek cities may perhaps be due to him (cf. Polyb. x. 27). Most of these new cities were based on older settlements; but the essential point is, that they were peopled by Greek and Macedonian colonists, and enjoyed civic independence with laws, officials, councils and assemblies of their own, in other words, an autonomous communal constitution, under the suzerainty of the empire. A portion, moreover, of the surrounding land was assigned to them. Thus a great number of the country districts—the ἔθνη above mentioned—were transformed into municipal corporations, and thereby withdrawn from the immediate government of the king and his officials (satraps or *strategi*), though still subject to their control, except in the cases where they received unconditional freedom and so ranked as "confederates." The native population of these villages and rural districts, at first, had no civic rights, but were governed by the foreign settlers. Soon, however, the two elements began to coalesce; in the Seleucid Empire, the process seems generally to have been both rapid and complete. Thus the cities became the main factors in the diffusion of Hellenism, the Greek language and the Greek civilization over all Asia as far as the Indus. At the same time they were the centres of commerce and industrial life: and this, in conjunction with the royal favour, and the privileges accorded them, continually drew new settlers (especially Jews), and many of them developed into great and flourishing towns (see further under HELLENISM).

Shortly after his conquest of Babylonia, Seleucus had founded a new capital, Seleucia (*q.v.*), on the Tigris: his intention being at once to displace the ancient Babylon from its former central position, and to replace it by a Greek city. This was followed by a series of other foundations in Mesopotamia, Babylonia and Susiana (Elam). "Media," says Polybius (x. 27), "was encircled by a sequence of Greek towns, designed as a barrier against the barbarians." Among those mentioned are: Rhagae (Rai), which Seleucus metamorphosed into a Hellenic city, Europus, Laodicea, Apamea and Heraclea (Strabo xi. 525; Plin. vi. 43; cf. MEDIA). To these must be added Achaea in Parthia, and, farther to the east, Alexandria Arion in Aria, the modern Herat; also Antiochia Margiana (Strabo xi. 514, 516; Plin. 46, 93), now Merv, and many others. Further, Alexandria in Aradrosia, near Kandahar, and the towns founded by Alexander on the Hindu-Kush and in Sogdiana.

[1] The discussion of these events by Hogarth, "The Deification of Alexander the Great," in *The English Historical Review*, ii. (1887), is quite unsatisfactory.

[2] See PTOLEMIES; SELEUCID DYNASTY.

Thus an active Hellenic life soon arose in the East; and Greek settlers must have come in numbers and founded new cities, which afterwards formed the basis of the Graeco-Bactrian kingdom. Antiochus's general Demodamas crossed the Jaxartes and set up an altar to the Didymaean Apollo (Plin. vi. 49). Another general, Patrocles, took up the investigation of the Caspian, already begun by Alexander. In contrast with the better knowledge of an older period, he came to the conclusion that the Caspian was connected with the ocean, and that it was possible to reach India on ship-board by that route (Strabo ii. 74, xi. 518; Plin. vi. 38). A project of Seleucus to connect the Caspian with the Sea of Azov by means of a canal is mentioned by Pliny (vi. 31). To Patrocles is due the information that an active commerce in Indian wares was carried on with the shores of the Black Sea, via the Caspian (Strabo xi. 509).

The Persian Religion under Greek Rule.

While Hellenism was thus gaining a firm footing in all the East, the native population remained absolutely passive. Apart from the rude mountain tribes, no national resistance was dreamed of for centuries. The Iranians quietly accepted the foreign yoke, and the higher classes adopted the external forms of the alien civilization (cf. the dedication of a Bactrian, Hyspasines, son of Mithroaxes, in the inventory of the temple of Apollo in Delos, Dittenberger, *Sylloge*, 588, l. 109) even though they were unable to renounce their innate characteristics. Eratosthenes, for instance, speaks (*ap.* Strabo i. 66) in high terms of the Iranians (*Ariani*), ranking them (as well as the Indians, Romans and Carthaginians) on a level with the Greeks, as regards their capacity for adopting city civilization. The later Parsee tradition contends that Alexander burned the sacred books of Zoroaster, the *Avesta*, and that only a few fragments were saved and afterwards reconstructed by the Arsacids and Sassanids. This is absolutely unhistorical. The Persian religion was never attacked by the Macedonians and Greeks. Under their dominion, on the contrary, it expanded with great vigour, not only in the west (Armenia, north Syria and Asia Minor, where it was the official religion of the kings of Pontus and Cappadocia), but also in the east, in the countries of the Indian frontier. That the popular gods—Mithras, Anaitis, &c.—had come to the forefront has already been mentioned. This propagandism, however, was void of all national character, and ran on precisely the same lines as the propagandism of the Syrian, Jewish and Egyptian cults. Only in Persis itself, so far as we can judge from a few scanty traces, the national character of the religion seems to have survived among the people side by side with the memory of their old imperial position.

Independent Kingdoms in Bactria and Parthia.

In 282 B.C. Seleucus took the field against Lysimachus, and annexed his dominions in Asia Minor and Thrace. In 281 he was assassinated in crossing to Europe, and his son Antiochus I. was left supreme over the whole empire. From that time onward the Seleucid Empire was never at rest. Its gigantic extent, from the Aegean to the Indus, everywhere offered points of attack to the enemy. The Lagidae, especially, with their much more compact and effective empire, employed every means to weaken their Asiatic rivals; and auxiliaries were found in the minor states on the frontier—Atropatene, Armenia, Cappadocia, Pontus and Bithynia, the Galatians, Pergamum, Rhodes and other Greek states. Moreover, the promotion of Greek civilization and city life had created numerous local centres, with separate interests and centrifugal tendencies, struggling to attain complete independence, and perpetually forcing new concessions from the empire. Thus the Seleucid kings, courageous as many of them were, were always battling for existence (see SELEUCID DYNASTY).

These disturbances severely affected the borders of Iran. While the Seleucid Empire, under Antiochus II. Theos (264–247), was being harried by Ptolemy II. Philadelphus, and the king's attention was wholly engaged in the defence of the western provinces, the Greeks revolted in Bactria, under their governor Diodotus (*q.v.*). Obviously, it was principally the need of protection against the nomadic tribes which led to the foundation of an independent kingdom; and Diodotus soon attained considerable power over the provinces north of the Hindu-Kush. In other provinces, too, insurrection broke out (Strabo xi. 575; Justin xli. 4); and Arsaces, a chief of the Parni or Aparni—an Iranian nomad tribe (therefore often called Dahan Scythians), inhabiting the steppe east of the Caspian—made himself master of the district of Parthia (*q.v.*) in 248 B.C. He and his brother Tiridates (*q.v.*) were the founders of the Parthian kingdom, which, however, was confined within very modest limits during the following decades. Seleucus II. Callinicus (247–226) successfully encountered Arsaces (or Tiridates), and even expelled him (*c.* 238); but new risings recalled Seleucus to Syria, and Arsaces was enabled to return to Parthia.

Antiochus III., the Great.

Greater success attended Antiochus III. the Great (222–187). At the beginning of his reign (220) he subdued, with the help of his minister Hermias, an insurrection of the satrap Molon of Media, who had assumed the royal title and was supported by his brother Alexander, satrap of Persis (Polyb. v. 40 sqq.). He further seized the opportunity of extorting an advantageous peace from King Artabazanes of Atropatene, who had considerably extended his power (Polyb. v. 55). After waging an unsuccessful war with Ptolemy IV. for the conquest of Coele-Syria, but suppressing the revolt of Achaeus in Asia Minor, and recovering the former provinces of the empire in that quarter, Antiochus led a great expedition into the East, designing to restore the imperial authority in its full extent. He first removed (211) the Armenian king Xerxes by treachery (Polyb. viii. 25; John of Antioch, *fr.* 53), and appointed two governors, Artaxias and Zariadris, in his place (Strabo xi. 531). During the next year he reduced the affairs of Media to order (Polyb. x. 27); he then conducted a successful campaign against Arsaces of Parthia (209), and against Euthydemus (*q.v.*) of Bactria (208–206), who had overthrown the dynasty of Diodotus (Polyb. x. 28 sqq., 48 sqq., xi. 34; Justin xli. 5). In spite of his successes he concluded peace with both kingdoms, rightly considering that it would be impossible to retain these remote frontier provinces permanently. He next renewed his old friendship with the Indian king Sophagasenus (Subhagasena), and received from him 150 elephants (206 B.C.). Through Arachosia and Drangiane, in the valley of the Etymander (Helmand), he marched to Carmania and Persis (Polyb. xi. 34). Both here and in Babylonia he re-established the imperial authority, and in 205 undertook a voyage from the mouth of the Tigris, through the Arabian Gulf to the flourishing mercantile town of Gerrha in Arabia (now Bahrein; Polyb. xiii. 9).

Decay of the Seleucid Empire.

Shortly afterwards, however, his successful campaign against Ptolemy V. Epiphanes led to a war with Rome in which the power of the Seleucid Empire was shattered (190 B.C.), Asia Minor lost, and the king compelled to pay a heavy contribution to Rome for a long term of years. In order to raise money he plundered a wealthy temple of Bel in Elam, but was killed by the inhabitants, 187 B.C. (Diod. xxviii. 3, xxix. 15; Strabo xvi. 744; Justin xxxii. 2; S. Jerome (Hieronymus) on *Dan.* xi. 19; Euseb. *Chron.* i. 253). The consequence of this enfeeblement of the empire was that the governors of Armenia asserted their independence. Artaxias founded the kingdom of Great Armenia; Zariadris, that of Sophene on the Euphrates and the sources of the Tigris (Strabo xi. 531). In other districts, also, rebellions occurred; and in the east, Euthydemus and his successors (Demetrius, Eucratidas, &c.) began the conquest of the Indus region and the Iranian borderland (Arachosia, Aria). (See BACTRIA; EUTHYDEMUS; EUCRATIDAS; DEMETRIUS; MENANDER.)

But the energetic Seleucids fought desperately against their fate. Antiochus IV. Epiphanes (176–163) restored once more the Eastern dominion, defeated Artaxias of Armenia (Appian, *Syr.* 45; Diod. xxxi. 17a; S. Jerome on *Dan.* xi. 40), restored several towns in Babylonia and subdued the Elymaeans. His attempt, however, to plunder the sanctuary of Anaitis failed (Polyb. xxxi. 11; cf. Maccab. i. 6, ii. 1, 13; App. *Syr.* 66). Persis, also, and

an autocrat, above them and above the law, realizing the theoretical doctrines of Plato and Aristotle, as the true king, who is a god among men, bound no more than Zeus by a law, because "himself he is the law." Thus the divine kingship of Alexander derives in direct line, not from the Oriental polities—which (Egypt apart) know nothing of royal apotheosis—but from these Hellenic theories of the state. Henceforward it becomes the form of every absolute monarchy in a civilized land, being formally mitigated only in Christian states by the assumption that the king is not God, but king "by the grace of God." The expedition of 332 B.C. to the shrine of Ammon was a preliminary to this procedure, which, in 324, was sealed by his official elevation to divine rank in all the republics of Greece. To this corresponds the fact that, instead of acting on the doctrines of Aristotle and Callisthenes, and treating the Macedonians and Greeks as masters, the Asiatics as servants, Alexander had impartial recourse to the powers of all his subjects and strove to amalgamate them. In the Persians particularly he sought a second pillar for his world-empire. Therefore, as early as 330 B.C., he drafted 30,000 young Persians, educated them in Greek customs, and trained them to war on the Macedonian model. The Indian campaign showed that his Macedonian troops were in fact inadequate to the conquest of the world, and in the summer of 326 they compelled him to turn back from the banks of the Hyphasis. On his return to Persia, he consummated at Susa (Feb. 324 B.C.) the union of Persian and Macedonian by the great marriage-feast, at which all his superior officers, with some 10,000 more Macedonians, were wedded to Persian wives. The Macedonian veterans were then disbanded, and the Persians taken into his army. Simultaneously, at the Olympian festival of 324, the command was issued to all the cities of Greece to recognize him as god and to receive the exiles home.[1] In 323 B.C. the preparations for the circumnavigation and subjection of Arabia were complete: the next enterprise being the conquest of the West, and the battle for Hellenic culture against Carthage and the Italian tribes. At that point Alexander died in Babylon on the 13th of June 323 B.C.

The Kingdoms of the Diadochi.

Alexander left no heir. Consequently, his death not only ended the scheme of universal conquest, but led to an immediate Macedonian reaction. The army, which was considered as the representative of the people, took over the government under the direction of its generals. The Persian wives were practically all discarded and the Persian satraps removed—at least from all important provinces. But the attempt to maintain the empire in its unity proved impracticable; and almost immediately there began the embittered war, waged for several decades by the generals (diadochi), for the inheritance of the great king.[2] It was soon obvious that the eastern rulers, at all events, could not dispense with the native element. Peucestas, the governor of Persis, there played the rôle of Alexander and won the Persians completely to his side; for which he was dismissed by Antigonus in 315 (Diod. xix. 48). A similar position was attained by Seleucus—the only one of the diadochi, who had not divorced his Persian wife, Apama—in Babylonia, which he governed from 319 to 316 and regained in the autumn of 312. While Antigonus, who, since 315, had striven to win the kingdom of Alexander for himself—was detained by the war with his rivals in the west, Seleucus, with Babylon as his headquarters, conquered the whole of Iran as far as the Indus. In northern Media alone, which lay outside the main scene of operations and had only been partially subject to the later Achaemenids, the Persian satrap Atropates, appointed by Alexander, maintained his independence and bequeathed his province to his successors. His name is borne by north Media to the present day—Atropatene, modern Azerbaijan or Adherbeijan (see MEDIA). So, too, in Armenia the Persian dynasty of the Hydarnids held its ground; and to these must be added, in the east of Asia Minor, the kingdoms of Pontus and Cappadocia, founded *c.* 301, by the Persians Mithradates I. and Ariarathes I. These states were fragments of the Achaemenid Empire, which had safely transferred themselves to the Hellenistic state-system.

[1] The discussion of these events by Hogarth, "The Deification of Alexander the Great," in *The English Historical Review*, ii. (1887), is quite unsatisfactory.

[2] See PTOLEMIES; SELEUCID DYNASTY.

Seleucus I. Nicator, and Antiochus I.

The annexation of Iran by Seleucus Nicator led to a war for the countries on the Indian frontier; his opponent being Sandracottus or Chandragupta Maurya (*q.v.*), the founder of the great Indian Empire of Maurya (Palimbothra). The result was that Seleucus abandoned to the Indian king, not merely the Indian provinces, but even the frontier districts west of the Indus (Strabo xv. 689–724), receiving as compensation 500 elephants, with other presents (Appian, *Syr.* 55; Justin xv. 4; Plut. *Alex.* 62; Athen. i. 18 D.). His next expedition was to the west to assist Lysimachus, Ptolemy and Cassander in the overthrow of Antigonus.

The battle of Ipsus, in 301, gave him Syria and the east of Asia Minor; and from then he resided at the Syrian town of Antiochia on the Orontes. Shortly afterwards he handed over the provinces east of the Euphrates to his son Antiochus, who, in the following years, till 282, exercised in the East a very energetic and beneficial activity, which continued the work of his father and gave the new empire and the Oriental Hellenistic civilization their form. In order to protect his conquests Alexander had founded several cities in Bactria, Sogdiana and India, in which he settled his veterans. On his death, these revolted and endeavoured to return to Greece, but were attacked and cut to pieces by Pithon (Diod. xviii. 7).

Greek Towns in Iran.
